UNCONDITIONAL SCHAUDER FRAMES OF TRANSLATES
IN $L_p(\mathbb{R}^d)$

MIGUEL BERASATEGUI AND DANIEL CARANDO

Abstract. We show that, for $1 < p \leq 2$, the space $L_p(\mathbb{R}^d)$ does not admit unconditional Schauder frames $\{f_i, f'_i\}_{i \in \mathbb{N}}$ where $\{f_i\}$ is a sequence of translates of finitely many functions and $\{f'_i\}$ is seminormalized. In fact, the only subspaces of $L_p(\mathbb{R}^d)$ admitting such Banach frames are those isomorphic to $\ell_p$. On the other hand, if $2 < p < +\infty$ and $\{\lambda_i\}_{i \in \mathbb{N}} \subseteq \mathbb{R}^d$ is an unbounded sequence, there is a subsequence $\{\lambda_{m_i}\}_{i \in \mathbb{N}}$, a function $f \in L_p(\mathbb{R}^d)$, and a seminormalized sequence of bounded functionals $\{f'_i\}_{i \in \mathbb{N}}$ such that $\{T_{\lambda_{m_i}}f, f'_i\}_{i \in \mathbb{N}}$ is an unconditional Schauder frame for $L_p(\mathbb{R}^d)$.

1. Introduction.

We study Schauder frames of translates in subspaces of $L_p(\mathbb{R}^d)$. For $\lambda \in \mathbb{R}^d$, the translation operator $T_\lambda$ is defined by

$$(T_\lambda f)(x) = f(x - \lambda),$$

where $f$ is a function defined in $\mathbb{R}^d$. Given a sequence $\{\lambda_i\}_{i \in \mathbb{N}}$ and a function $f \in L_p(\mathbb{R}^d)$, the closed linear span of the sequence of translates

$$X = \overline{\{T_{\lambda_i}f : i \in \mathbb{N}\}} \subset L_p(\mathbb{R}^d)$$

has been studied by many authors (see, for example, [1, 3, 7, 8, 17, 18, 22], where techniques from harmonic analysis are the main tools, and [9, 16], where Banach space techniques are essential). Systems formed by translates of finitely many functions were also studied (see, for example, [15]).

One might classify many of the different questions which are behind this research into two families. The first one focuses on $X$ itself: does it coincide with $L_p(\mathbb{R}^d)$? If not, what can we say about $X$? (do we have an isomorphic description? is it complemented in $L_p(\mathbb{R}^d)$? The second family of questions focuses on the sequence $\{T_{\lambda_i}f\}_i$: is it a Schauder basis of $X$? or a Schauder frame? What about unconditionality? However, the (maybe) most natural question belongs to the intersection of these families: does $L_p(\mathbb{R}^d)$ admits (unconditional) Schauder bases (or frames) formed by translates? In other words, can we have both $X = L_p(\mathbb{R}^d)$ and $\{T_{\lambda_i}f\}_i$ a Schauder basis/frame? We recall some results in this direction that motivated our research.

Theorem 1.1. [18, Theorem 2] If $\{T_{\lambda_i}f\}_{i \in \mathbb{N}} \subseteq L_2(\mathbb{R})$ is an unconditional basic sequence, then $\overline{\{T_{\lambda_i}f : i \in \mathbb{N}\}} \neq L_2(\mathbb{R})$.

Theorem 1.2. [10] Corollary 2.10] Let $1 \leq p \leq 2$ If $\{T_\lambda, f\}_{i \in \mathbb{N}} \subseteq L_p(\mathbb{R})$ is an unconditional basic sequence, it is equivalent to the unit vector basis of $\ell_p$. Hence, if $1 < p < 2$, then $[T_\lambda, f : i \in \mathbb{N}] \neq L_p(\mathbb{R})$.

Theorem 1.3. [10] Theorem 4.3] Let $1 < p \leq 2$. If $\{f_i\}_{i \in \mathbb{N}} \subseteq L_p(\mathbb{R}^d)$ is an unconditional basic sequence of translates of elements of a finite set, then $[f_i : i \in \mathbb{N}] \neq L_p(\mathbb{R}^d)$.

Theorem 1.4. [9] Theorem 2.1, Corollary 2.3] Let $2 < p < +\infty$, and let $\{T_\lambda, f\}_{i \in \mathbb{N}} \subseteq L_p(\mathbb{R})$ be an unconditional basic sequence. If $[T_\lambda, f : i \in \mathbb{N}]$ is complemented in $L_p(\mathbb{R})$, $\{T_\lambda, f\}_{i \in \mathbb{N}}$ is equivalent to the unit vector basis of $\ell_p$. Hence, $[T_\lambda, f : i \in \mathbb{N}] \neq L_p(\mathbb{R})$.

Theorem 1.5. [9] Theorem 3.2] Let $2 < p < +\infty$, and $d \in \mathbb{N}$. If $\{\lambda_i\}_{i \in \mathbb{N}} \subseteq \mathbb{R}^d$ is an unbounded sequence, there exists $f \in L_p(\mathbb{R}^d)$ and $\{f_i\}_{i \in \mathbb{N}} \subseteq (L_p(\mathbb{R}^d))'$ such that $\{T_\lambda, f, f_i\}_{i \in \mathbb{N}}$ is an unconditional Schauder frame for $L_p(\mathbb{R}^d)$.

The proof of Theorem 1.5 given in [9] gives a Schauder frame $\{T_\lambda, f, f_i\}_{i \in \mathbb{N}}$ for $L_p(\mathbb{R}^d)$ such that $\{f_i\}_{i \in \mathbb{N}}$ tends to zero in norm as $i$ tends to infinity. Identifying the dual space $(L_p(\mathbb{R}^d)')$ of $L_p(\mathbb{R}^d)$ with $L_{p'}(\mathbb{R}^d)$ in the usual way $\left(\frac{1}{p} + \frac{1}{p'} = 1\right)$, the authors ask the following question:

Problem 1. [9] Problem 6.3] Let $1 < p < +\infty$, and let $\{f_i\}_{i \in \mathbb{N}}$ be a sequence of translates of $f \in L_p(\mathbb{R})$. Is there a seminormalized sequence $\{f_i\}_{i \in \mathbb{N}} \subseteq L_{p'}(\mathbb{R})$ such that $\{f, f_i\}$ forms an unconditional Schauder frame for $L_p(\mathbb{R})$?

In this article, we study mainly unconditional (approximate) Schauder frames of translates of a function or of finitely many functions for subspaces of $L_p(\mathbb{R}^d)$, and in particular, we focus on Problem 1. In Section 2, we introduce some notation, recall some known facts and prove some general results. We study Schauder frames and approximate Schauder frames in general Banach spaces, and present sufficient conditions for the existence of seminormalized coordinates, which we will use in the proofs of our main results. In Section 3, we introduce Schauder frames of translates in $L_p(\mathbb{R}^d)$ and prove some technical results that are used in the sequel. Section 4 has the main results of the article. In Section 4.1 we study the case $2 < p < +\infty$. Modifying the proof of Theorem 1.5 from [9], we prove in Theorem 4.1 that, for every unbounded sequence $\{\lambda_i\}_{i \in \mathbb{N}} \subseteq \mathbb{R}^d$, we can take a subsequence $\{\lambda_{m_i}\}_{i \in \mathbb{N}} \subseteq \mathbb{R}^d$, a function $f \in L_p(\mathbb{R}^d)$, and a seminormalized sequence $\{f_i\}_{i \in \mathbb{N}} \subseteq L_{p'}(\mathbb{R}^d)$ such that $\{T_{\lambda_{m_i}}, f, f_i\}_{i \in \mathbb{N}}$ is an unconditional Schauder frame for $L_p(\mathbb{R}^d)$. This shows, in particular, that there are sequences of translates $\{f_i\}$ for which the answer to the question in Problem 1 is positive (for $2 < p < +\infty$). In Section 4.2 we study the case $1 < p \leq 2$. In opposition to the previous case, we prove that for any such $p$, Problem 1 has a negative answer, no matter how we chose the sequence of translates. In Section 4.3 we consider $p = 1$. We show in Proposition 4.3 that, under a natural geometric condition on the sequences of translates, any subspace of $L_1(\mathbb{R}^d)$ admitting an unconditional frame of translates must be isomorphic to $\ell_1$.

2. Preliminaries.

In this section, we present some definitions and basic results. Unless otherwise stated, we assume that all of the spaces we consider are infinite-dimensional and
separable Banach spaces over \( \mathbb{K} \), where \( \mathbb{K} \) may be chosen to be either \( \mathbb{C} \) or \( \mathbb{R} \). If \( X \) is a Banach space, we denote its dual by \( X' \), and by \( B_X \) its closed unit ball. If \( T : X \to Y \) is a bounded operator, its transpose \( T^* : Y' \to X' \) is given by \( T^*(y') = y' \circ T \) for \( y' \in Y' \). For \( \lambda \in \mathbb{R}^d, |\lambda| \) denotes the Euclidean norm of \( \lambda \).

We say that the sequence \( \{f_i\}_{i \in \mathbb{N}} \subset X \) is bounded below if there is \( r > 0 \) such that \( \|f_i\| \geq r \) for all \( i \in \mathbb{N} \). The sequence \( \{f_i\}_{i \in \mathbb{N}} \) is called seminormalized if it is both bounded and bounded below.

Recall that a Banach space \( X \) has type \( p \) if there exists \( M > 0 \) such that
\[
\left( \int_0^1 \left\| \sum_{i=1}^n r_i(t)f_i \right\|^2 \, dt \right)^{\frac{1}{p}} \leq M \left( \sum_{i=1}^n \|f_i\|^p \right)^{\frac{1}{p}}
\]
for every finite sequence \( \{f_i\}_{1 \leq i \leq n} \subset X \). Also, \( X \) has cotype \( s \) if there is \( M > 0 \) such that
\[
\left( \sum_{i=1}^n \|f_i\|^s \right)^{\frac{1}{s}} \leq M \left( \int_0^1 \left\| \sum_{i=1}^n r_i(t)f_i \right\|^2 \, dt \right)^{\frac{1}{2}} \quad \forall n \in \mathbb{N}
\]
for every \( \{f_i\}_{1 \leq i \leq n} \subset X \). Here, \( \{r_i\}_{i \in \mathbb{N}} \) is the sequence of Rademacher functions given by
\[
r_i(t) = \text{sgn}(\sin(2^i \pi t)) \quad \forall t \in [0, 1] \quad \forall i \in \mathbb{N}.
\]

It is known that for every measure space \( (\Omega, \Sigma, \nu) \) and \( 1 \leq p < +\infty \), the space \( L_p(\nu) \) has type \( \min\{2, p\} \) and cotype \( \max\{2, p\} \) \([13]\), and that if a space \( X \) is of type \( p > 1 \), its dual space \( X' \) is of cotype \( p' \), where \( \frac{1}{p} + \frac{1}{p'} = 1 \) \([13]\) Proposition 1.e.17). From these facts and Orlicz Theorem (see \([19, 20]\) or Theorems 4.2.1 and 4.2.2 from \([10]\)), we have the following.

**Proposition 2.1.** Let \( 1 < p < +\infty, s = \max\{2, p\}, q = \max\{2, p'\} \) and let \( X \) be a subspace \( L_p(\nu) \), then

(a) If \( \sum_{i=1}^\infty f_i \) converges unconditionally in \( X \), then \( \sum_{i=1}^\infty \|f_i\|_X^s \) converges.

(b) If \( \sum_{i=1}^\infty f_i' \) converges unconditionally in \( X' \), then \( \sum_{i=1}^\infty \|f_i\|_X'^q \) converges.

The following remark is a consequence of the previous proposition and a standard uniform boundedness argument.

**Remark 2.2.** With \( p, q, s \) and \( X \) as in the previous proposition, the following hold.

(a) If \( \{f_i\}_{i \in \mathbb{N}} \subset X \) is bounded below and \( \sum_{i=1}^\infty f_i'(g)f_i \) converges unconditionally for each \( g \in X \), we can define a bounded linear operator \( \Psi_s : X \to \ell_s \) by
\[
\Psi_s(g) = (f_i'(g))_{i \in \mathbb{N}} \quad \text{for} \quad g \in X.
\]

(b) If \( \{f_i\}_{i \in \mathbb{N}} \subset X' \) is bounded below and \( \sum_{i=1}^\infty h'(f_i)f_i' \) converges unconditionally for each \( h' \in X' \), then we can define bounded linear operator \( \Theta_q : X' \to \ell_q \) by
\[
\Theta_q(h') = (h'(f_i))_{i \in \mathbb{N}} \quad \text{for} \quad h' \in X'.
\]
Also, \( \Phi_{q'} = \Theta_q^* \) has its range in \( X \) and

\[
\Phi_{q'}(a) = \sum_{i=1}^{\infty} a_i f_i \quad \text{for} \quad a = (a_i)_{i \in \mathbb{N}} \in \ell_{q'}.
\]

A sequence \( \{f_i\}_{i \in \mathbb{N}} \) in a Banach space \( X \) is a Schauder basis for \( X \) if every element \( g \in X \) has a unique expansion of the form

\[
g = \sum_{i=1}^{\infty} a_i f_i,
\]

with \( \{a_i\}_{i \in \mathbb{N}} \subseteq K \). A sequence that is a Schauder basis for the closure of its span \( \overline{\text{span}\{f_i : i \in \mathbb{N}\}} \) is called a basic sequence. A Schauder basis is called is unconditional if the convergence in (2) is unconditional for every \( g \in X \).

If \( \{f_i\}_{i \in \mathbb{N}} \) is a Schauder basis for \( X \), there is a uniquely determined sequence \( \{f'_i\}_{i \in \mathbb{N}} \) in its dual space \( X' \) such that \( f'_i(f_j) = \delta_{ij} \) for every pair of positive integers \( (i,j) \), and thus

\[
g = \sum_{i=1}^{\infty} f'_i(g)f_i \quad \forall g \in X.
\]

We call the sequence \( \{f'_i\}_{i \in \mathbb{N}} \) the sequence of coordinate functionals corresponding to the basis.

A sequence \( \{f_i, f'_i\}_{i \in \mathbb{N}} \subseteq X \times X' \) for which (3) holds is called a Schauder frame for \( X \). Note that, in this case, we do not require uniqueness of expansions like in (2). We call the sequence \( \{f'_i\}_{i \in \mathbb{N}} \) the sequence of coordinate functionals of the frame. If the convergence in (3) is unconditional for every \( g \in X \), the Schauder frame is called unconditional. Note that \( f'_i(f_j) = \delta_{ij} \) for every \( i, j \in \mathbb{N} \) if and only if \( \{f_i\}_{i \in \mathbb{N}} \) is basic.

If \( \{f_i, f'_i\}_{i \in \mathbb{N}} \) is a Schauder frame for \( X \), there exists \( K \geq 1 \) such that for every \( n \in \mathbb{N} \) and every \( g \in X \) we have

\[
\left\| \sum_{i=1}^{n} f'_i(g)f_i \right\|_{X} \leq K\|g\|_{X}.
\]

The infimum of such \( K \) is called the frame constant of \( \{f_i, f'_i\}_{i \in \mathbb{N}} \). If the frame is unconditional, there exists \( K \geq 1 \) such that

\[
\left\| \sum_{i=1}^{\infty} c_if'_i(g)f_i \right\|_{X} \leq K\|g\|_{X}\|c\|_{\ell_{\infty}}.
\]

for all \( g \in X \) and \( c = (c_i)_{i \in \mathbb{N}} \in \ell_{\infty} \). The infimum of such constants \( K \) is called the unconditional constant of the frame \( \{f_i, f'_i\}_{i \in \mathbb{N}} \).

In [9], an extension of the concept of Schauder frames was introduced: a sequence \( \{f_i, f'_i\}_{i \in \mathbb{N}} \subseteq X \times X' \) is called an approximate Schauder frame for \( X \) if there is an isomorphism \( S : X \to X \) given by

\[
S(f) = \sum_{i=1}^{\infty} f'_i(g)f_i \quad \forall g \in X.
\]

The operator \( S \) is called the frame operator. An approximate Schauder frame is said to be unconditional if the convergence in (4) is unconditional for each \( g \in X \). Note that, by the uniform boundedness principle, one can extend the concepts of
frame constant and unconditional frame constant to approximate Schauder frames and unconditional approximate Schauder frames respectively, though unlike the case of frames, they might be smaller than one. We will define similar constants for a larger class of sequences: for each sequence \( \{f_i, f'_i\}_{i \in \mathbb{N}} \subseteq X \times X' \) we define the frame constant of \( \{f_i, f'_i\}_{i \in \mathbb{N}} \) by

\[
K \left( \{f_i, f'_i\}_{i \in \mathbb{N}} \right) = \max \left\{ 1, \sup_{n \in \mathbb{N}} \sup_{g \in B_{X'}} \left\| \sum_{i=1}^{n} f'_i(g)f_i \right\| \right\},
\]

In a similar way, we define the unconditional frame constant of \( \{f_i, f'_i\}_{i \in \mathbb{N}} \) by

\[
K_u \left( \{f_i, f'_i\}_{i \in \mathbb{N}} \right) = \max \left\{ 1, \sup_{n \in \mathbb{N}} \sup_{g \in B_{X'}, c \in B_{c^\infty}} \left\| \sum_{i=1}^{n} c_i f'_i(g)f_i \right\| \right\}.
\]

Note that, if \( \sum_{i=1}^{\infty} f'_i(g)f_i \) converges for every \( g \in X \), then by the uniform boundedness principle, \( K \left( \{f_i, f'_i\}_{i \in \mathbb{N}} \right) \) is finite. Similarly, if the series converges unconditionally for each \( g \in X \), \( K_u \left( \{f_i, f'_i\}_{i \in \mathbb{N}} \right) \) is finite.

The rest of this section is devoted to prove some technical results. Their main goal is to obtain, from a given approximate Schauder frame \( \{f_i, f'_i\}_{i \in \mathbb{N}} \) for \( X \), a new Schauder frame for \( X \) with seminormalized coordinates, which preserves some properties of the original approximate frame. We need the following lemma from [9].

**Lemma 2.3.** [9 Lemma 3.1] Let \( X \) be a Banach space. If \( \{f_i, f'_i\}_{i \in \mathbb{N}} \subseteq X \times X' \) is an approximate Schauder frame for \( X \) with frame operator \( S \), then \( \{f_i, (S^{-1})^* f'_i\}_{i \in \mathbb{N}} \) is a Schauder frame for \( X \). Moreover, if \( \{f_i, f'_i\}_{i \in \mathbb{N}} \) is unconditional, so is \( \{f_i, (S^{-1})^* f'_i\}_{i \in \mathbb{N}} \).

In the proof of our next lemma, we first obtain an approximate Schauder frame with seminormalized coordinates from an approximate Schauder frame, by adding to the coordinate functionals a seminormalized sequence of functionals with sufficiently small norms, and then, by an application of Lemma 2.3, we get a Schauder frame with seminormalized coordinate functionals from it.

**Lemma 2.4.** Let \( \{f_i, f'_i\}_{i \in \mathbb{N}} \subseteq X \times X' \) be an approximate Schauder frame for \( X \) with \( \{f_i\}_{i \in \mathbb{N}} \) bounded below. If there is a seminormalized sequence \( \{g_i\}_{i \in \mathbb{N}} \subseteq X' \) such that \( \sum_{i=1}^{\infty} g'_i(g)f_i \) converges unconditionally for each \( g \in X \), then there is a seminormalized sequence \( \{f'_i\}_{i \in \mathbb{N}} \subseteq X' \) such that \( \{f_i, f'_i\}_{i \in \mathbb{N}} \) is a Schauder frame for \( X \), which is unconditional if \( \{f_i, f'_i\}_{i \in \mathbb{N}} \) is unconditional.

**Proof.** Let \( S \) be the frame operator of \( \{f_i, f'_i\}_{i \in \mathbb{N}} \). Since \( S : X \to X \) is an isomorphism, there exists \( 0 < \delta_0 < 1 \) such that every \( T : X \to X \) with \( \|S - T\| \leq \delta_0 \) is also an isomorphism. Note that \( \|f'_i(g)f_i\| \leq 2K \left( \{f_i, f'_i\}_{i \in \mathbb{N}} \right) \|g\| \) and \( \|g'_i(g)f_i\| \leq K_u \left( \{f_i, g'_i\}_{i \in \mathbb{N}} \right) \|g\| \) for all \( g \in X \) and all \( i \in \mathbb{N} \), so both \( \{f'_i\}_{i \in \mathbb{N}} \) and \( \{f_i\}_{i \in \mathbb{N}} \) are bounded. Set

\[
K_1 = \max \left\{ \|S\|, K_u \left( \{f_i, g'_i\}_{i \in \mathbb{N}} \right), \sup_{j \in \mathbb{N}} \left\{ \max \left\{ \|g'_i\|, \frac{1}{\|g'_i\|} \|f_j\|, \|f'_j\| \right\} \right\} \right\}.
\]

(5)
For each \( i \in \mathbb{N} \), let \( G'_i = f'_i + b_i g'_i \), where
\[
  b_i = \begin{cases} 
    \frac{1}{K_1} & \text{if } \|f'_i\| < \frac{1}{2K_1}; \\
    0 & \text{otherwise}.
  \end{cases}
\]
For each \( g \in X \), both \( \sum_{i=1}^{\infty} b_i g'_i(g) f_i \) and \( \sum_{i=1}^{\infty} f'_i(g) f_i \) are convergent. Hence, we can define a linear operator \( T : X \rightarrow X \) by
\[
  T(g) = \sum_{i=1}^{\infty} G'_i(g) f_i \quad \forall g \in X.
\]
Since \( |b_i| \leq K_1^{-1} \) for each \( i \in \mathbb{N} \), we obtain
\[
  \|S(g) - T(g)\| = \left\| \sum_{i=1}^{\infty} f'_i(g) f_i - \sum_{i=1}^{\infty} G'_i(g) f_i \right\| 
  \leq K_u \left( \{f_i, g'_i\}_{i \in \mathbb{N}} \right) \|b_i\| \|g\| \leq \delta b K_1 K_1^{-1} \|g\| = \delta b \|g\|.
\]
Therefore, \( T \) is an isomorphism, so \( \{f_i, G'_i\}_{i \in \mathbb{N}} \subseteq X \times X' \) is an approximate Schauder frame for \( X \). For each \( i \in \mathbb{N} \), let \( F'_i = (T^{-1})^* (G'_i) \). By Lemma 2.3, \( \{f_i, F'_i\}_{i \in \mathbb{N}} \) is a Schauder frame for \( X \). Note that \( \{G'_i\}_{i \in \mathbb{N}} \) is bounded because both \( \{f'_i\}_{i \in \mathbb{N}} \) and \( \{g'_i\}_{i \in \mathbb{N}} \) are bounded. Also, from (5) we get that \( K_1^{-1} \leq \|g'_i\| \) for each \( i \in \mathbb{N} \), so our choice of \( \{b_i\}_{i \in \mathbb{N}} \) gives
\[
  \|G'_i\| \geq \frac{1}{2K_1} \quad \forall i \in \mathbb{N}.
\]
Hence, \( \{G'_i\}_{i \in \mathbb{N}} \) is seminormalized, and thus so is \( \{F'_i\}_{i \in \mathbb{N}} \). If \( \{f_i, F'_i\}_{i \in \mathbb{N}} \) is unconditional, then for every \( g \in X \), the series \( \sum_{i=1}^{\infty} f'_i(g) f_i \) converges unconditionally. Since \( \sum_{i=1}^{\infty} b_i g'_i(g) f_i \) also converges unconditionally, it follows that \( \{f_i, G'_i\}_{i \in \mathbb{N}} \) is unconditional and, by Lemma 2.3, so is \( \{f_i, F'_i\}_{i \in \mathbb{N}} \).

**Corollary 2.5.** Let \( \{f_i, f'_i\}_{i \in \mathbb{N}} \subseteq X \times X' \) be an approximate Schauder frame for \( X \) such that \( \{f_i\}_{i \in \mathbb{N}} \) is bounded below. Suppose that \( X \) contains a complemented copy of \( \ell_q \) (\( 1 \leq q < \infty \)) and that there is \( M_0 > 0 \) such that
\[
(6) \quad \left\| \sum_{i=1}^{n} a_i f_i \right\| \leq M_0 \left( \sum_{i=1}^{n} |a_i|^q \right)^{\frac{1}{q}},
\]
for each \( n \in \mathbb{N} \) and every \( \{a_i\}_{1 \leq i \leq n} \subseteq K \). Then, there is a seminormalized sequence \( \{F'_i\}_{i \in \mathbb{N}} \subseteq X' \) such that \( \{f_i, F'_i\}_{i \in \mathbb{N}} \subseteq X \times X' \) is a Schauder frame for \( X \). Moreover, \( \{F'_i\}_{i \in \mathbb{N}} \) can be chosen so that \( \{f_i, F'_i\}_{i \in \mathbb{N}} \) is unconditional if \( \{f_i, f'_i\}_{i \in \mathbb{N}} \) is unconditional.

**Proof.** Let \( Y \subseteq X \) be a complemented copy of \( \ell_q \) and \( P : X \rightarrow Y \) be a bounded projection. Let \( \{H_i\}_{i \in \mathbb{N}} \) be a basis of \( Y \) equivalent to the unit vector basis of \( \ell_q \), with coordinate functionals \( \{H'_i\}_{i \in \mathbb{N}} \subseteq Y' \). By (3), there is a bounded operator \( T : Y \rightarrow X \) such that \( T(H_i) = f_i \). The basis \( \{H_i\}_{i \in \mathbb{N}} \) is equivalent to the unit
basis of \( \ell_q \) and, then, the series \( \sum_i H'_i(P(g))H_i \) converges unconditionally for every \( g \in X \). Since \( T \) is bounded, the series
\[
\sum_i H'_i(P(g))T(H_i) = \sum_i P^*(H'_i(g))f_i
\]
also converges unconditionally. Since \( P^* \) is bounded below, we can apply Lemma 2.4 with \( g_i = P^*(H'_i) \) to get the seminormalized sequence \( \{F'_i\}_{i \in \mathbb{N}} \subseteq X' \) with the desired properties. \( \square \)

3. Unconditional Schauder frames of translates: definitions and general results.

Fix a finite family \( \{g_k\}_{1 \leq k \leq k_0} \subset L_p(\mathbb{R}^d) \) (of different, nonzero functions), and a sequence \( \{\lambda_i\}_{i \in \mathbb{N}} \subset \mathbb{R}^d \). We say that a sequence \( \{f_i\}_{i \in \mathbb{N}} \subseteq L_p(\mathbb{R}^d) \) is a sequence of translates of \( \{g_k\}_{1 \leq k \leq k_0} \) by \( \{\lambda_i\}_{i \in \mathbb{N}} \subset \mathbb{R}^d \) if, for each \( i \in \mathbb{N} \), there exists a unique \( k = 1, \ldots, k_0 \) such that \( f_i \) is the translation of \( g_k \) by \( \lambda_i \). In other words, there is a partition \( \{\Delta_k\}_{1 \leq k \leq k_0} \) of \( \mathbb{N} \) into disjoint sets such that
\[
(7) \quad f_i = T_{\lambda_i}g_k \quad \forall i \in \Delta_k \quad \forall 1 \leq k \leq k_0.
\]
We may assume that each \( \Delta_k \) is nonempty (if some \( \Delta_k \) is empty, the corresponding \( g_k \) is not used in the translations and we can remove it from the family).

**Definition 3.1.** An approximate Schauder frame (or a Schauder frame) \( \{f_i, f'_i\}_{i \in \mathbb{N}} \) for a subspace \( X \) of \( L_p(\mathbb{R}^d) \) is called an approximate Schauder frame of translates (or a Schauder frame of translates) if \( \{f_i\}_{i \in \mathbb{N}} \) is a sequence of translates of finitely many functions by some sequence \( \{\lambda_i\}_{i \in \mathbb{N}} \subseteq \mathbb{R}^d \).

In this section, we study unconditional Schauder frames and approximate Schauder frames of translates of a single function or of finitely many functions in \( L_p(\mathbb{R}^d) \), for \( 1 < p < +\infty \). In particular, we focus on unconditional Schauder frames of translates with seminormalized coordinate functionals. We first introduce some definitions.

**Definition 3.2.** [15] An indexed family \( \{\lambda_i\}_{i \in \Delta} \subseteq \mathbb{R}^d \) is uniformly separated if there is \( \delta > 0 \) such that
\[
|\lambda_i - \lambda_{i'}| \geq \delta \quad \forall i \neq i' \in \Delta,
\]
The set is relatively uniformly separated if there is a partition \( \{\Delta_i\}_{1 \leq i \leq m} \) of \( \Delta \) such that \( \{\lambda_i\}_{i \in \Delta} \) is uniformly separated for all \( 1 \leq i \leq m \).

Note that all the elements of a uniformly separated family are different, but this does not necessarily hold for relatively uniformly separated indexed sets.

**Remark 3.3.** If \( \{\lambda_i\}_{i \in \Delta} \subseteq \mathbb{R}^d \) is relatively uniformly separated, each compact set \( Q \subset \mathbb{R}^d \) can contain only a finite number of \( \lambda_i \)’s. As a consequence, for any \( t > 0 \) we can take a (further) partition \( \{A_k\}_{1 \leq k \leq k_0} \) of \( \Delta \) such that
\[
|\lambda_i - \lambda_j| \geq t \quad \forall (i, j) \in A_k \times A_k : i \neq j \quad \forall 1 \leq k \leq k_0.
\]
In [18, Theorem 1] and [16, Proposition 1.8], the authors prove that if \( \{f_i, f'_i\}_{i \in \mathbb{N}} \) is a biorthogonal system in \( L_p(\mathbb{R}^d) \) and \( \{f_i\}_{i \in \mathbb{N}} \) is a sequence of translates of \( f \) by a sequence \( \{\lambda_i\}_{i \in \mathbb{N}} \subseteq \mathbb{R}^d \), then \( \{\lambda_i\}_{i \in \mathbb{N}} \) is uniformly separated. In [15], similar results are obtained for more general sequences. In particular, the following statement will be useful for our purposes.
Theorem 3.4. [15] Lemma 2.5 and Theorem 3.5 (i) Let \( q > 1, \ K > 0 \) and \( 1 < p < +\infty \). Suppose \( \{f_i\}_{i \in \mathbb{N}} \subseteq X \subseteq L_p(\mathbb{R}^d) \) is a sequence of translates of \( \{g_k\}_{1 \leq k \leq k_0} \) by \( \{\lambda_j\}_{j \in \mathbb{N}} \) and
\[
\sum_{i=1}^{\infty} |h'(f_i)|^p \leq K ||h'||^p \quad \forall h' \in X'.
\]
Then, \( \{\lambda_j\}_{j \in \mathbb{N}} \) is relatively uniformly separated.

The following lemma is probably known, but we could not find a reference for it.

Lemma 3.5. Let \( X \) be a reflexive Banach space, and let \( \{f_i, f'_i\}_{i \in \mathbb{N}} \) be a sequence in \( X \times X' \). The following are equivalent:

(i) \( \sum_{i=1}^{\infty} h'(f_i)f'_i \) converges unconditionally for each \( h' \in X' \).

(ii) \( \sum_{i=1}^{\infty} f'_i(g)f_i \) converges unconditionally for each \( g \in X \).

Proof. [1] \( \Rightarrow \) [ii] Fix \( g \in X \). For each \( h' \in X' \), choose \( (a_i(h'))_{i \in \mathbb{N}} \in B_{\ell_\infty} \) so that
\[
\sum_{i=1}^{\infty} a_i(h')h'(f_i)f'_i(g) = \left( \sum_{i=1}^{\infty} a_i(h')h'(f_i)f'_i \right)(g) < +\infty,
\]
for all \( h' \in X' \). Since \( X \) does not contain a subspace isomorphic to \( c_0 \), it follows from Theorem 3.5 of Bessaga-Pelczynski that \( \sum_{i=1}^{\infty} f'_i(g)f_i \) converges unconditionally (see [2] Theorem 5 or [10] Theorem 6.4.3).

(ii) \( \Rightarrow \) (i) Since \( X \) is reflexive, this is proven by essentially the same argument. \( \Box \)

If \( \{f_i, f'_i\}_{i \in \mathbb{N}} \) is an unconditional approximate Schauder frame for a reflexive Banach space \( X \), by the previous lemma \( \sum_{i=1}^{\infty} f'(f_i)f'_i \) converges unconditionally for each \( f' \in X' \). Thus, if \( S : X \to X \) is the frame operator of \( \{f_i, f'_i\}_{i \in \mathbb{N}} \), then for every \( f' \in X' \) we have
\[
S^* f'(f) = f' \langle S(f) \rangle = f' \left( \sum_{i=1}^{\infty} f'_i(f) f_i \right) = \left( \sum_{i=1}^{\infty} f'(f_i) f'_i \right)(f) \quad \forall f \in X.
\]

Hence, \( S^* f' = \sum_{i=1}^{\infty} f'(f_i) f'_i \). Since \( S^* : X' \to X' \) is an isomorphism, it follows that \( \{f'_i, f_i\}_{i \in \mathbb{N}} \) is an approximate unconditional Schauder frame for \( X' \) with frame operator \( S^* \). For unconditional Schauder frames, this result follows at once from [1] Theorem 1.4, Theorem 2.5 and [5] Proposition 2.2, Remark 3.2. It was also proven in [12] Theorem 5.1, under the assumption that for each \( i \in \mathbb{N} \), \( \left| f'_{i,j} \right|_{f_{i,j} \geq n} \to 0 \) as \( n \to +\infty \).

Corollary 3.6. Let \( 1 < p < +\infty \). Suppose \( \{f_i, f'_i\}_{i \in \mathbb{N}} \subseteq X \times X' \) is an unconditional approximate Schauder frame for \( X \subseteq L_p(\mathbb{R}^d) \), and \( \{f_i\}_{i \in \mathbb{N}} \) is a sequence of translates of \( \{g_k\}_{1 \leq k \leq k_0} \) by \( \{\lambda_i\}_{i \in \mathbb{N}} \). If \( \{f'_i\}_{i \in \mathbb{N}} \) is seminormalized, then \( \{\lambda_i\}_{i \in \mathbb{N}} \) is relatively uniformly separated.
Proof. By the previous comments and Remark 2.2, $h' \rightarrow (h'(f_i))_{i \in \mathbb{N}}$ defines a bounded linear operator from $X'$ into $\ell_q$, where $q = \max\{2, p'\}$. Then, Theorem 3.4 shows that $\{\lambda_i\}_{i \in \mathbb{N}}$ is relatively uniformly separated. \qed

As a consequence of our next lemma and its corollary, for unconditional approximate Schauder frames of relatively uniformly separated translates with seminormalized coordinates, we can strengthen some conclusions of Remark 2.2. The proof of the lemma is a variant of the proof of [11] Lemma 2, Section 3.

Lemma 3.7. Let $1 \leq p < +\infty$, and let $\{f_i\}_{i \in \mathbb{N}} \subseteq L_p(\mathbb{R}^d)$. Suppose there is a partition $\{A_k\}_{1 \leq k \leq k_0}$ of $\mathbb{N}$, $\epsilon > 0$ and measurable sets $\{D_{i,k}\}_{i \in A_k}$ such that

$$D_{i,k} \cap D_{i',k} = \emptyset \text{ for } i, i' \in A_k, \ i \neq i' \text{ and } 1 \leq k \leq k_0;$$

$$\int_{D_{i,k}} |f_i(x)|^p \, dx \geq \epsilon \quad \forall i \in A_k \ \forall 1 \leq k \leq k_0.$$ 

If $\sum_{i=1}^{\infty} a_i f_i$ converges unconditionally, then $\sum_{i=1}^{\infty} |a_i|^p < \infty$.

Proof. Since $\sum_{i=1}^{n} a_i f_i$ converges unconditionally, there is $K > 0$ such that

$$\left\| \sum_{i=1}^{n} c_i a_i f_i \right\| \leq K \|c\| \text{ for all } c = (c_i)_{i \in \mathbb{N}} \in \ell_\infty, \ n \in \mathbb{N}.$$ 

As a consequence, fixed $1 \leq k \leq k_0$ and $n \in \mathbb{N}$ we have

$$\epsilon \sum_{j \in A_k} |a_j|^p \leq \sum_{j \in A_k} \int_{D_{i,k}} |a_j f_j(x)|^p \, dx$$

$$= \sum_{j \in A_k} \left| \int_{D_{i,k}} \left( \int_0^1 \sum_{1 \leq i \leq n} a_i f_i(x) r_i(t) r_j(t) \, dt \right)^p \, dx \right|$$

$$\leq \sum_{j \in A_k} \int_{D_{i,k}} \int_0^1 \left| \sum_{1 \leq i \leq n} a_i f_i(x) r_i(t) \right|^p \, dt \left( \int_0^1 |r_j(t)|^{p'} \, dt \right)^{p/p'} \, dx,$$

by Hölder’s inequality. Since $D_{j,k} \cap D_{j',k}$ is empty for $j \neq j'$ and Rademacher functions have modulus one, this last expression is bounded by

$$\int_{\mathbb{R}^d} \int_0^1 \left| \sum_{1 \leq i \leq n} r_i(t) a_i f_i(x) \right|^p \, dtdx = \int_0^1 \left\| \sum_{1 \leq i \leq n} r_i(t) a_i f_i \right\|^p \, dt \leq K^p,$$

Therefore,

$$\sum_{i=1}^{\infty} |a_i|^p = \sum_{k=1}^{k_0} \sum_{i \in A_k} |a_i|^p \leq \frac{k_0 K^p}{\epsilon} < +\infty.$$ 

Corollary 3.8. Let $1 \leq p < +\infty$, and let $\{f_i, f_i'\}_{i \in \mathbb{N}}$ be an unconditional approximate Schauder frame of translates for $X \subseteq L_p(\mathbb{R}^d)$ by a relatively uniformly
Proof. Suppose \( \{f_i\}_{i \in \mathbb{N}} \) is a sequence of translates of \( \{g_k\}_{1 \leq k \leq k_0} \) by \( \{\lambda_i\}_{i \in \mathbb{N}} \). Since all \( g_k \neq 0 \) for \( 1 \leq k \leq k_0 \), there exists \( \epsilon > 0 \) and a cube \( Q \subseteq \mathbb{R}^d \) such that
\[
\int_Q |g_k(x)|^p \, dx \geq \epsilon \quad \forall 1 \leq k \leq k_0.
\]
By Remark 3.3 there is a partition \( \{A_m\}_{1 \leq m \leq m_0} \) of \( \mathbb{N} \) such that
\[ Q + \lambda_i \cap Q + \lambda_j = \emptyset \quad \forall (i, j) \in A_m \times A_m : i \neq j \quad \forall 1 \leq m \leq m_0. \]
Let \( \{\Delta_k\}_{1 \leq k \leq k_0} \) be a partition of \( \mathbb{N} \) such that
\[ f_i = T_{\lambda_i} g_k \quad \forall i \in \Delta_k \quad \forall 1 \leq k \leq k_0, \]
and let
\[ D_{i,m,k} = Q + \lambda_i \quad \forall i \in A_m \cap \Delta_k \quad \forall 1 \leq m \leq m_0 \quad \forall 1 \leq k \leq k_0. \]
Fix \( 1 \leq k \leq k_0 \) and \( 1 \leq m \leq m_0 \). We have
\[
\int_{D_{i,m,k}} |f_i(x)|^p \, dx = \int_{Q + \lambda_i} |T_{\lambda_i} g_k(x)|^p \, dx = \int_Q |g_k(x)|^p \, dx \geq \epsilon \quad \forall i \in A_m \cap \Delta_k.
\]
By Lemma 3.7 this implies that \( \sum_{i=1}^{\infty} |f'_i(g)|^p < +\infty \) for each \( g \in X \). A uniform boundedness argument completes the proof. \( \square \)

Note that for the case \( 2 \leq p < +\infty \), the result of Lemma 3.7 follows immediately from Proposition 2.1 but it is convenient for our purposes to state the lemma and its corollary for all \( 1 \leq p < +\infty \).

Now we prove the main result of this section.

**Proposition 3.9.** Let \( \{f_i, f'_i\}_{i \in \mathbb{N}} \) be an unconditional approximate Schauder frame of translates for \( X \subseteq L_p(\mathbb{R}^d) \), with \( 1 < p < +\infty \), by a relatively uniformly separated sequence \( \{\lambda_i\}_{i \in \mathbb{N}} \). If there exists \( M_0 > 0 \) such that
\[
\left| \sum_{i=1}^{n} a_i f_i \right| \leq M_0 \left( \sum_{i=1}^{n} |a_i|^p \right)^{\frac{1}{p}}
\]
for each \( n \in \mathbb{N} \) and every \( \{a_i\}_{1 \leq i \leq n} \subseteq \mathbb{K} \), then, the following assertions hold.

(a) The sequence \( \{\lambda_i\}_{i \in \mathbb{N}} \) is relatively uniformly separated.

(b) The linear operator \( g \rightarrow (f'_i(g))_{i \in \mathbb{N}} \) is an isomorphism between \( X \) and a complemented subspace of \( \ell_p \). In particular, \( X \) is isomorphic to \( \ell_p \).

(c) There is a seminormalized sequence \( \{F'_i\}_{i \in \mathbb{N}} \) such that \( \{f_i, F'_i\}_{i \in \mathbb{N}} \) is an unconditional Schauder frame for \( X \).

**Proof.** Suppose that \( \{f_i\}_{i \in \mathbb{N}} \) is a sequence of translates of \( \{g_k\}_{1 \leq k \leq k_0} \) by \( \{\lambda_i\}_{i \in \mathbb{N}} \). Let \( \Phi_p : \ell_p \rightarrow X \) be the bounded linear operator given by
\[
\Phi_p(a) = \sum_{i=1}^{\infty} a_i f_i \quad \text{for } a \in \ell_p.
\]
If \( \{ e^{(i)} \}_{i \in \mathbb{N}} \) is the unit vector basis of \( \ell_p \), for each \( h' \) in \( X' \) we have

\[
\sum_{i=1}^{\infty} | h'(f_i) |^{p'} = \sum_{i=1}^{\infty} | \Phi_p^* (h') (e^{(i)}) |^{p'} = | \Phi_p^* (h') |^{p'} \ell_p \leq | \Phi_p |^{p'} |h'|^{p'} \leq M_0'^* |h'|^{p'}
\]

Hence, by Theorem 3.4 \( \{ \lambda_i \}_{i \in \mathbb{N}} \) is relatively uniformly separated and, by Corollary 3.8 we can define a bounded linear operator \( \Psi_p : X \to \ell_p \) by

\[
\Psi_p (g) = (f'_i(g))_{i \in \mathbb{N}} \quad \text{for} \quad g \in X.
\]

Let \( S \) be the frame operator of \( \{ f_i, f'_i \}_{i \in \mathbb{N}} \), and take \( Z = \Psi_p (X) \). For each \( g \in X \), we have

\[
(11) \quad S^{-1} \circ \Phi_p |_{Z} (\Psi_p (g)) = S^{-1} (\Phi_p ((f'_i(g))_{i \in \mathbb{N}})) = S^{-1} \left( \sum_{i=1}^{\infty} f'_i(g) f_i \right) = S^{-1} (S(g)) = g.
\]

This shows that \( \Psi_p \) is an isomorphism between \( X \) and \( Z \). If \( a = (a_i)_{i \in \mathbb{N}} \in Z \), there is \( g \in X \) such that \( \Psi_p (g) = a \). Thus, it follows from (11) and (11) that \( a = \Psi_p (g) = \Psi_p \left( S^{-1} \circ \Phi_p (\Psi_p (g)) \right) = \Psi_p \left( S^{-1} \circ \Phi_p (a) \right) = (\Psi_p \circ S^{-1} \circ \Phi_p) (a) \).

Therefore, \( \Psi_p \circ S^{-1} \circ \Phi_p : \ell_p \to Z \) is a bounded projection. Since every complemented subspace of \( \ell_p \) is isomorphic to \( \ell_p \) (Theorem 2.3), \( X \) is isomorphic to \( \ell_p \).

Now, (c) is a direct application of Corollary 2.5.

\[ \square \]

4. SCHAUDER FRAMES OF TRANSLATES IN \( L_p(\mathbb{R}^d) \)

4.1. The case \( 2 < p < +\infty \). The main result of this section is the following strengthened version of Theorem 1.4 that gives unconditional frames of translates for \( L_p(\mathbb{R}^d) \) with seminormalized coordinate functionals.

Theorem 4.1. Let \( 2 < p < +\infty \) and let \( \{ \lambda_i \}_{i \in \mathbb{N}} \subseteq \mathbb{R}^d \) be an unbounded sequence. There is a subsequence \( \{ \lambda_{m_i} \}_{i \in \mathbb{N}} \), a function \( f \in L_p(\mathbb{R}^d) \), and a seminormalized sequence \( \{ F'_i \}_{i \in \mathbb{N}} \subseteq L_{p'}(\mathbb{R}^d) \) such that \( \{ T_{\lambda_{m_i}} f, F'_i \}_{i \in \mathbb{N}} \) is an unconditional Schauder frame for \( L_p(\mathbb{R}^d) \).

Proof. We first present a sketch of the main steps in the proof of Theorem 1.4 from Theorem 3.2.

(a) Choose a normalized unconditional Schauder basis \( \{ h_i \} \) for \( L_p(\mathbb{R}^d) \) such that \( \text{diam} (\text{supp} (h_i)) \leq 1 \) for each \( i \in \mathbb{N} \), and a sequence \( \{ N_k \}_{k \in \mathbb{N}} \subseteq \mathbb{N} \) such that

\[
(12) \quad \left( \sum_{k=1}^{\infty} N_k^{1-\frac{1}{p}} \right)^{\frac{1}{p}} < \frac{1}{2k} \left( \frac{1}{\{ h_i, h'_i \}_{i \in \mathbb{N}}} \right).
\]

where \( \{ h'_i \}_{i \in \mathbb{N}} \) is the sequence of coordinate functionals associated with the basis \( \{ h_i \}_{i \in \mathbb{N}} \).

(b) Choose a sequence of positive integers \( \{ j^{(k)} \}_{k \in \mathbb{N}} \) with the following properties:

(i) \( j^{(k)} < j^{(k')} \ \forall k < k' \ \forall 1 \leq s \leq N_k' \ \forall 1 \leq s' \leq N_k' \).

(ii) \( j^{(k)} < j^{(s')} \ \forall k \in \mathbb{N} \ \forall 1 \leq s < s' \leq N_k \).

(iii) $|\lambda_{j_s}^{(k)}| > 1$, and

$$\left|\lambda_{j_s}^{(k)}\right| > 3 \max \left\{ \left|\lambda_{j_s}^{(k')}\right| : j_s^{(k')} < j_s^{(k)} \right\} + 2 \max \left\{|x| : x \in \operatorname{supp}(h_j), 1 \leq j \leq k \right\}$$

$\forall k \in \mathbb{N} \forall 1 \leq s \leq N_k.$

From these choices, the sets

$$J_k = \left\{ j_s^{(k)} : 1 \leq s \leq N_k \right\}$$

are pairwise disjoint.

Let $\mathcal{D} = \bigcup_{k=1}^{\infty} J_k$, and

$$k_i = \begin{cases} k & \text{if } i \in J_k; \\ 0 & \text{if } i \notin \mathcal{D}. \end{cases}$$

It follows that

$$\operatorname{supp} \left( T_{\lambda_i - \lambda_j} h_{k_i} \right) \cap \operatorname{supp} \left( T_{\lambda_i - \lambda_j} h_{k_j'} \right) = \emptyset$$

for every $j, j', i, i' \in \mathcal{D}$ with $i \neq j$, $i' \neq j'$, and $(i, j) \neq (i', j')$. Define

$$f = \sum_{k=1}^{\infty} \sum_{j \in J_k} N_k^{-\frac{d}{2}} T_{\lambda_i} h_k,$$

and for each $i \in \mathbb{N},$

$$f_i' = \begin{cases} N_k^{-\frac{d}{2}} h_k' & \text{if } i \in J_k \\ 0 & \text{if } i \notin \mathcal{D}. \end{cases}$$

With this, $\{T_{\lambda_i} f, f_i'\}$ is an unconditional approximate Schauder frame for $L_p(\mathbb{R}^d)$.

Now we modify this proof to obtain our result. First, we write

$$\mathcal{D} = \{m_i\}_{i \in \mathbb{N}},$$

with $\{m_i\}$, an increasing sequence of natural numbers.

Since $\{T_{\lambda_i} f, f_i'\}_{i \in \mathbb{N}}$ is an unconditional approximate Schauder frame for $L_p(\mathbb{R}^d)$ and $f_i' = 0$ for all $i \notin \mathcal{D}$, then clearly $\{T_{\lambda_{m_i}} f, f_{m_i}'\}_{i \in \mathbb{N}}$ is an unconditional approximate Schauder frame for $L_p(\mathbb{R}^d)$. By Remark 2.2, we can define a bounded linear operator $\Phi_2 : \ell_2 \to L_p(\mathbb{R}^d)$ by

$$\Phi_2(a) = \sum_{k=1}^{\infty} a_k h_k \quad \forall a = (a_i)_{i \in \mathbb{N}} \in \ell_2.$$

For $A$ a finite subset of $\mathcal{D}$ and $\{b_i\}_{i \in \mathbb{N}} \subset \mathbb{K}$ we have

$$\left\| \sum_{i \in A} b_i T_{\lambda_i} f \right\| = \left\| \sum_{i \in A} b_i \sum_{k=1}^{\infty} \sum_{j \in J_k} N_k^{-\frac{d}{2}} T_{\lambda_i - \lambda_j} h_k \right\|$$

$$\leq \left\| \sum_{i \in A} b_i \sum_{k=1}^{\infty} \sum_{j \in J_k} N_k^{-\frac{d}{2}} T_{\lambda_i - \lambda_j} h_k \right\| + \left\| \sum_{i \in A} b_i N_k^{-\frac{d}{2}} h_{k_i} \right\|$$

$$\leq \left\| \sum_{i \in A} b_i \sum_{k=1}^{\infty} \sum_{j \in J_k} N_k^{-\frac{d}{2}} T_{\lambda_i - \lambda_j} h_k \right\| + \left\| \sum_{i \in A} b_i N_k^{-\frac{d}{2}} h_{k_i} \right\|$$
Next, we estimate each of the terms on the right-hand side of (17). From (12), (13) and the fact that \( \{h_i\}_{i \in \mathbb{N}} \) is normalized, we have

\[
\left\| \sum_{i \in A} \sum_{k=1}^{\infty} \sum_{j \in J_k \setminus \{i\}} N_k^{-\frac{p}{2}} T_{\lambda_j}^{-1} h_k \right\| = \\
= \left( \sum_{i \in A} \sum_{k=1}^{\infty} \sum_{j \in J_k \setminus \{i\}} \int_{\text{supp}(T_{\lambda_j} h_k)} \left| b_i N_k^{-\frac{p}{2}} (T_{\lambda_j} h_k)(x) \right|^p \, dx \right)^{\frac{1}{p}} \\
\leq \left( \sum_{i \in A} \left\| b_i \right\|^p \sum_{k=1}^{\infty} N_k^{1-\frac{p}{2}} \right)^{\frac{1}{p}} \\
\leq \left( \sum_{i \in A} |b_i|^2 \right)^{\frac{1}{2}}.
\]

(18)

From (15), we also have

\[
\left\| \sum_{i \in A} b_i N_k^{-\frac{1}{2}} h_k \right\| = \left\| \sum_{k \in \mathbb{N}} \left( \sum_{i \in A \setminus J_k} b_i N_k^{-\frac{1}{2}} \right) h_k \right\| \\
\leq \left\| \Phi_2 \right\| \left( \sum_{k \in \mathbb{N}} \left( \sum_{i \in A \setminus J_k} b_i N_k^{-\frac{1}{2}} \right)^2 \right)^{\frac{1}{2}} \\
\leq \left\| \Phi_2 \right\| \left( \sum_{k \in \mathbb{N}} \left( \sum_{i \in A \setminus J_k} |b_i|^2 \right) \left( \sum_{i \in A \setminus J_k} N_k^{-1} \right) \right)^{\frac{1}{2}} \\
\leq \left\| \Phi_2 \right\| \left( \sum_{k \in \mathbb{N}} \left( \sum_{i \in A \setminus J_k} |b_i|^2 \right) \right)^{\frac{1}{2}} \\
= \left\| \Phi_2 \right\| \left( \sum_{i \in A} |b_i|^2 \right)^{\frac{1}{2}}.
\]

(19)

(20)

From (17), (18), and (20) we get

\[
\left\| \sum_{i \in A} b_i T_{\lambda_i} f \right\| \leq (1 + \left\| \Phi_2 \right\|) \left( \sum_{i \in A} |b_i|^2 \right)^{\frac{1}{2}}.
\]
Thus, for every $n \in \mathbb{N}$ and for every set of scalars $\{a_i\}_{1 \leq i \leq n}$, we have
\[
\left\| \sum_{i=1}^{n} a_i T_{\lambda_m} f \right\| \leq (1 + \|\Phi_2\|) \left( \sum_{i=1}^{n} |a_i|^2 \right)^{\frac{1}{2}}.
\]
To finish the proof, let $M_0 = 1 + \|\Phi_2\|$ and apply Corollary 2.5 to the unconditional approximate Schauder frame $\{T_{\lambda_m} f, f_m^\prime\}_{m \in \mathbb{N}}$.

A question that arises naturally in this context is whether the seminormalized sequence of Theorem 4.1 can be chosen so that $|F'_i(f_i)| \geq r$ for some $r > 0$. The answer is negative, as the following extension of Theorem 4.1 shows.

**Proposition 4.2.** Let $2 < p < +\infty$, and let $\{f_i, f_i^\prime\}_{i \in \mathbb{N}} \subseteq X \times X^\prime$ be an unconditional approximate Schauder frame of translates for $X \subseteq L_p(\mathbb{R}^d)$. If $X$ is complemented in $L_p(\mathbb{R}^d)$ and there is $r > 0$ such that $r \leq |f'_i(f_i)|$ for each $i \in \mathbb{N}$, then $g \mapsto (f'_i(g))_{i \in \mathbb{N}}$ defines an isomorphism between $X$ and a complemented subspace of $\ell_p$. Thus, $X$ is isomorphic to $\ell_p$.

**Proof.** Since $\{f_i\}_{i \in \mathbb{N}}$ is seminormalized, $\{|f'_i|\}_{i \in \mathbb{N}}$ is bounded. Let $P : L_p(\mathbb{R}^d) \to X$ be a bounded projection. Suppose that $\{f_i\}_{i \in \mathbb{N}}$ is a sequence of translates of $\{g_k\}_{1 \leq k \leq k_0}$ by $\{\lambda_i\}_{i \in \mathbb{N}}$ and choose $M > 0$ and a cube $Q \subseteq \mathbb{R}^d$ such that
\[
\max\{|P\|, |f'_i|, |f_i|\} \leq M \quad \forall i \in \mathbb{N};
\]
\[
\left\| f_k \right\|_{R^d \setminus Q} \leq \frac{r}{2M} \quad \forall 1 \leq k \leq k_0.
\]
Let $\{\Delta_k\}_{1 \leq k \leq k_0}$ be a partition of $\mathbb{N}$ for which (7) holds. By Remark 3.3 there is a partition $\{A_m\}_{1 \leq m \leq m_0}$ of $\mathbb{N}$ such that
\[
Q + \lambda_i \cap Q + \lambda_j = \emptyset \quad \forall (i, j) \in A_m \times A_m : i \neq j \quad \forall 1 \leq m \leq m_0,
\]
Fix $1 \leq k \leq k_0$ and $1 \leq m \leq m_0$. It follows from (21) and (22) that
\[
r \leq |f'_i(f_i)| = |f'_i(P(f_i))| = |P^* f'_i f_i| = \left\| \int_{\mathbb{R}^d} (P^* f'_i) (x) f_i(x) dx \right\|
\]
\[
\leq \int_{(\mathbb{R}^d \setminus Q) + \lambda_i} |(P^* f'_i)(x)g_k(x - \lambda_i)| \ dx + \left\| P^* f'_i \right\|_{Q + \lambda_i} \left\| f_i \right\|_{Q + \lambda_i}
\]
\[
\leq \left\| P^* f'_i \right\| \left\| g_k \right\|_{R^d \setminus Q} + M \left\| P^* f'_i \right\|_{Q + \lambda_i} \leq \frac{r}{2} + M \left\| P^* f'_i \right\|_{Q + \lambda_i},
\]
for all $i \in \Delta_k \cap A_m$. Thus,
\[
\frac{r}{2M} \leq \left\| P^* f'_i \right\|_{Q + \lambda_i} \quad \forall i \in \Delta_k \cap A_m.
\]
Since the series $\sum_{i=1}^{\infty} h'(f_i)f'_i$ converges unconditionally for each $h' \in X'$ and $P^*$ is bounded, so does $\sum_{i=1}^{\infty} h'(f_i)P^* f'_i$. From this fact, (23), (24) and Lemma 3.7 we deduce that there is linear operator $\Theta_{h'} : X' \to \ell_{p'}$ given by
\[
\Theta_{h'}(h') = (h'(f_i))_{i \in \mathbb{N}},
\]
which is bounded by the uniform boundedness principle. As in Remark 2.2 this implies that there is a bounded linear operator \( \Phi_p : \ell_p \to X \) given by

\[
\Phi_p(a) = \sum_{i=1}^{\infty} a_i f_i \quad \forall a = (a_i)_{i \in \mathbb{N}} \in \ell_p.
\]

Now we apply Proposition 3.9 to complete the proof. \( \square \)

If, in addition to the hypotheses of Proposition 4.2, we add the condition that \( \{f_i\}_{i \in \mathbb{N}} \) is basic, it follows from (25) and the uniqueness of the coefficients that \( \Phi_p \) is injective. Since it is also surjective and bounded, it is an isomorphism between \( \ell_p \) and \( X \). Thus, \( \{f_i\}_{i \in \mathbb{N}} \) is equivalent to the unit vector basis of \( \ell_p \). The condition that \( X \) be complemented in \( L_p(\mathbb{R}^d) \) is essential in this context. In fact, it was proven in [16, Example 2.16] that for \( p > 2 \), there are unconditional basic sequences of translates that are not equivalent to the unit vector basis of \( \ell_p \).

4.2. The case \( 1 < p \leq 2 \). Unlike the case \( 2 < p < +\infty \), for \( 1 < p \leq 2 \) Problem 1 has a negative answer for every sequence of translates. For \( 1 < p < 2 \), this is a consequence of a more general result, which we prove next.

**Theorem 4.3.** Let \( 1 < p \leq 2 \), and let \( X \) be a subspace of \( L_p(\mathbb{R}^d) \). Suppose \( \{f_i, f'_i\}_{i \in \mathbb{N}} \) is an unconditional approximate Schauder frame of translates for \( X \). The following are equivalent.

(i) There is a seminormalized sequence \( \{F'_i\}_{i \in \mathbb{N}} \subseteq X' \) such that \( \{f_i, F'_i\}_{i \in \mathbb{N}} \) is an unconditional Schauder frame for \( X \).

(ii) There is \( M_0 > 0 \) such that

\[
\left\| \sum_{i=1}^{n} a_i f_i \right\| \leq M_0 \left( \sum_{i=1}^{n} |a_i|^p \right)^{1/p}
\]

for each \( n \in \mathbb{N} \) and every finite set of scalars \( \{a_i\}_{1 \leq i \leq n} \).

Under these conditions, \( g \to (f'_i(g))_{i \in \mathbb{N}} \) defines an isomorphism between \( X \) and a complemented subspace of \( \ell_p \). Thus, \( X \) is isomorphic to \( \ell_p \).

**Proof.** To see that (i) \( \Rightarrow \) (ii) we apply Remark 2.2 to \( \{f_i, F'_i\}_{i \in \mathbb{N}} \) and set \( M_0 = \|\Phi_p\| \). The implication (ii) \( \Rightarrow \) (i) follows immediately by Proposition 3.9. Also by Proposition 4.4, we conclude that \( g \to (f'_i(g))_{i \in \mathbb{N}} \) is an isomorphism between \( X \) and a complemented subspace of \( \ell_p \). \( \square \)

If, in addition to the hypotheses of Theorem 4.3, we assume that \( \{f_i\}_{i \in \mathbb{N}} \) is a basic sequence, then we see that \( \Phi_p \) is an isomorphism between \( \ell_p \) and \( X \), so \( \{f_i\}_{i \in \mathbb{N}} \) is equivalent to the unit vector basis of \( \ell_p \). This gives an extension of Theorem 1.2 for \( L_p(\mathbb{R}^d) \) with \( d \geq 1 \) and for sequences of translates of finitely many functions.

Note that Theorem 4.3 does not give an answer to Problem 1 for \( p = 2 \). A negative answer will follow from more general results about the compactness of restriction operators, which are variants of similar results from [17] and [15]. We first state a result that follows immediately [15, Lemma 3.4 (i)]. A similar result was also proven in [16].

**Lemma 4.4.** Let \( 1 \leq p < +\infty \), and let \( \{\lambda_i\}_{i \in \mathbb{N}} \subseteq \mathbb{R}^d \) be a relatively uniformly separated sequence. If \( \{f_i\}_{i \in \mathbb{N}} \subset L_p(\mathbb{R}^d) \) is a sequence of translates of \( \{g_k\}_{1 \leq k \leq k_0} \),
by \( \{\lambda_i\}_{i \in \mathbb{N}} \) and \( D \) is a bounded measurable set, then
\[
\sum_{i=1}^{\infty} ||f_i||_D^p < +\infty.
\]

Now, from Corollary 3.8 and Lemma 4.4 we obtain a partial extension of [9, Proposition 5.1] to unconditional approximate Schauder frames.

**Proposition 4.5.** Let \( 1 < p \leq 2 \), and let \( \{f_i, f'_i\}_{i \in \mathbb{N}} \) be an unconditional approximate Schauder frame of translates for \( X \subseteq L_p(\mathbb{R}^d) \) by a uniformly separated sequence. Then, the restriction operator \( R_D : X \to L_p(D) \) given by \( R_D(g) = g|_D \) is compact for all bounded measurable \( D \). Thus, \( X \neq L_p(\mathbb{R}^d) \).

**Proof.** Let \( S \) be the frame operator of \( \{f_i, f'_i\}_{i \in \mathbb{N}} \), and let \( h'_i = (S^{-1})^* f'_i \) for every \( i \in \mathbb{N} \). By Lemma 2.3, \( \{f_i, h'_i\}_{i \in \mathbb{N}} \) is an unconditional Schauder frame for \( X \). By Corollary 3.8, there is a bounded linear operator \( \Psi_p : X \to \ell_p \) given by
\[
\Psi_p(g) = (h'_i(g))_{i \in \mathbb{N}} \quad \forall g \in X.
\]

For each \( n \in \mathbb{N} \), let
\[
T_n(g) = \sum_{i=1}^{n} h'_i(g)f_i|_D.
\]

Fix \( g \in X \) and \( n < m \). Since \( p \leq p' \), we have
\[
||(T_n - T_m)(g)|| = \left|\left| \sum_{i=n+1}^{m} h'_i(g)f_i|_D \right|\right| \leq \left( \sum_{i=n+1}^{m} |h'_i(g)|^p \right)^{\frac{1}{p}} \left( \sum_{i=n+1}^{m} ||f_i|_D||^p \right)^{\frac{1}{p}}.
\]

(28)

It follows from (27), (28) and Lemma 4.4 that \( \{T_n\}_{n \in \mathbb{N}} \) is a Cauchy sequence of finite rank operators. Thus, there is a compact operator \( T \) such that \( T_n \to T \) as \( n \to +\infty \). Since \( T_n(g) \to g|_D \) as \( n \to +\infty \) for every \( g \in X \), this completes the proof. \( \square \)

From Corollary 3.8 and Proposition 4.5, we obtain the negative answer of Problem 1 for \( p = 2 \) (and a new way to obtain the answer for \( 1 < p < 2 \)).

**Corollary 4.6.** Let \( 1 < p \leq 2 \). Suppose that \( \{f_i, f'_i\}_{i \in \mathbb{N}} \) is an unconditional approximate Schauder frame of translates for \( X \subseteq L_p(\mathbb{R}^d) \). If \( \{f'_i\}_{i \in \mathbb{N}} \) is seminormalized, the restriction operator \( R_D : X \to L_p(D) \) given by \( R_D(g) = g|_D \) is compact for all bounded measurable \( D \subseteq \mathbb{R}^d \). Hence, \( X \neq L_p(\mathbb{R}^d) \).

The compactness of the restriction operator in Proposition 4.5 gives us more information about the subspace \( [f_i : i \in \mathbb{N}] \) for \( 1 < p < 2 \). In fact, \( [f_i : i \in \mathbb{N}] \) is isomorphic to a subspace of \( \ell_p \). This follows from an immediate extension of [9, Proposition 5.3] to \( L_p(\mathbb{R}^d) \).

**Proposition 4.7.** Let \( X \) be a subspace of \( L_p(\mathbb{R}^d) \). Suppose that for all cubes \( Q \subseteq \mathbb{R}^d \) the restriction operator \( R_Q : X \to L_p(Q) \) given by \( R_Q(g) = g|_Q \), is compact. Then, \( X \) is isomorphic to a subspace of \( \ell_p \).
Corollary 4.8. Let $1 < p < 2$. If $\{f_i, f'_i\}_{i \in \mathbb{N}}$ is an unconditional approximate Schauder frame of translates for $X \subseteq L_p(\mathbb{R}^d)$ by a relatively uniformly separated sequence, then $X$ is isomorphic to a subspace of $\ell_p$.

4.3. The case $p = 1$. It is known that there are no unconditional Schauder frames from $L_1(\mathbb{R}^d)$. This follows from the facts that every space with an unconditional Schauder frame is isomorphic to a complemented subspace of a space with an unconditional Schauder basis [6, Theorem 3.6], and $L_1(\mathbb{R}^d)$ is not isomorphic to a subspace of a space with an unconditional Schauder basis (see [21] or Proposition 1.d.1 in [12]). With regard to Schauder frames of translates, it was proven in [16, Corollary 2.4] that if $\{T_{\lambda_i} f, f'_i\}_{i \in \mathbb{N}}$ is a Schauder frame for a subspace $X \subseteq L_1(\mathbb{R})$ and $\{\lambda_i\}_{i \in \mathbb{N}}$ is uniformly separated, then $X$ is isomorphic to a subspace of $\ell_1$. It also follows from [16, Corollary 2.4] that, in this case, the restriction operator $R_I : L_1(\mathbb{R}) \to L_1(I)$ is compact for every bounded interval $I \subseteq \mathbb{R}$. In particular, this implies that $X \neq L_1(\mathbb{R})$ (this last fact also follows from [16, Theorem 1.7] or [3, Theorem 1]). The described results can be extended in a straightforward manner to $L_1(\mathbb{R}^d)$ for every $d \in \mathbb{N}$ and to translates of finitely many functions by relatively uniformly separated sequences. Also, for unconditional (approximate) frames, we have the following result.

Proposition 4.9. Let $\{f_i, f'_i\}_{i \in \mathbb{N}}$ be an unconditional approximate Schauder frame of translates for $X \subseteq L_1(\mathbb{R}^d)$ by a relatively uniformly separated sequence. Then, the operator

$$\Psi_1(g) = (f'_i(g))_{i \in \mathbb{N}} \text{ for } g \in X$$

is an isomorphism between $X$ and a complemented subspace of $\ell_1$. In particular, $X$ is isomorphic to $\ell_1$.

Proof. Corollary 3.8 allows us to define $\Psi_1 : X \to \ell_1$ as in the statement. On the other hand, since $\{f_i\}_{i \in \mathbb{N}}$ is bounded, we can define a bounded linear operator $\Phi_1 : \ell_1 \to X$ by

$$\Phi_1 (a) = \sum_{i=1}^{\infty} a_i f_i \text{ for } a = (a_i)_{i \in \mathbb{N}} \in \ell_1.$$ 

The proof is completed by essentially the same argument given in the proof Proposition 3.9.

Proposition 4.9 can also be easily deduced from the fact that every sequence of translates by a relatively uniformly separated sequence in $L_1(\mathbb{R}^d)$ can be split into finitely many disjoint subsequences, each of them equivalent to the unit vector basis of $\ell_1$ (see [16, Remark 2.8 c])).

4.4. Some related questions. We end with a list of questions that arise naturally in the context of (unconditional) Schauder frames of translates. All the questions make sense for translates of a single function and for translates of finitely many functions are also interesting.

For $p = 1$, as we mentioned, an immediate extension of [16, Corollary 2.4] shows that there is no Schauder frame $\{f_i, f'_i\}_{i \in \mathbb{N}}$ for $L_1(\mathbb{R}^d)$ where the $\{f_i\}_{i \in \mathbb{N}}$ are...
translates of finitely many functions by a relatively uniformly separated sequence in $\mathbb{R}^d$.

It is natural to ask about the existence of Schauder frames of translates with seminormalized coordinates for $L_1(\mathbb{R}^d)$, without any restrictions on the sequence by which a function is translated.

**Question 1.** Is there a Schauder frame of translates $\{f_i, f'_i\}_{i\in\mathbb{N}}$ for $L_1(\mathbb{R}^d)$ with seminormalized $\{f'_i\}_{i\in\mathbb{N}}$?

Note that if $\{f_i, f'_i\}_{i\in\mathbb{N}}$ is an approximate Schauder frame for a subspace $X \subseteq L_1(\mathbb{R}^d)$ containing a complemented copy of $\ell_1$ and $\{f_i\}_{i\in\mathbb{N}}$ is seminormalized, by Corollary [25] there is a seminormalized sequence $\{F'_i\} \subseteq X'$ such that $\{f_i, F'_i\}_{i\in\mathbb{N}}$ is a Schauder frame for $X$. Thus, Question [1] is equivalent to the following.

**Question 2.** Is there a Schauder frame of translates $\{f_i, f'_i\}_{i\in\mathbb{N}}$ for $L_1(\mathbb{R}^d)$?

For $1 < p \leq 2$, Proposition [4.5] gives a negative answer to Problem [1] from Section [1]. Moreover, it shows that there are no unconditional frames for $L_p(\mathbb{R}^d)$ of the form $\{T_{\lambda_i} f, f'_i\}_{i\in\mathbb{N}}$, for any relatively uniformly separated sequence $\{\lambda_i\}_{i\in\mathbb{N}}$. Again, it is natural to ask what happens if we omit the restrictions on $\{\lambda_i\}_{i\in\mathbb{N}}$.

**Question 3.** Let $1 < p \leq 2$.

(a) Is there an unconditional Schauder frame of translates $\{f_i, f'_i\}_{i\in\mathbb{N}}$ for $L_p(\mathbb{R}^d)$?

(b) Is there a Schauder frame of translates $\{f_i, f'_i\}_{i\in\mathbb{N}}$ for $L_p(\mathbb{R}^d)$ with seminormalized $\{f'_i\}_{i\in\mathbb{N}}$?

In Theorem [4.1] we showed that for every unbounded sequence $\{\lambda_i\}_{i\in\mathbb{N}} \subseteq \mathbb{R}^d$, there exists an unconditional Schauder frame with seminormalized coordinates of the form $\{T_{\lambda_i}f, f'_i\}_{i\in\mathbb{N}}$, where $f$ is the function constructed in [9] Theorem 3.2], and $\{\lambda_m_i\}_{i\in\mathbb{N}}$ is a subsequence of $\{\lambda_j\}_{j\in\mathbb{N}}$. One could ask for necessary and sufficient conditions under which one could keep the original sequence, instead of a (proper) subsequence of it.

**Question 4.** Let $2 < p < +\infty$, and let $\{\lambda_i\}_{i\in\mathbb{N}} \subseteq \mathbb{R}^d$ be a relatively uniformly separated sequence. What conditions on $\{\lambda_i\}_{i\in\mathbb{N}} \subseteq \mathbb{R}^d$ ensure the existence of a function $f \in \mathbb{R}^d$ and a seminormalized sequence $\{F'_i\}_{i\in\mathbb{N}} \subseteq L_p(\mathbb{R}^d)$ such that $\{T_{\lambda_i}f, F'_i\}_{i\in\mathbb{N}}$ is an unconditional Schauder frame for $L_p(\mathbb{R}^d)$?

Finally, we mention that Theorem [4.1] only gives a partial answer to Problem [1] for the case $2 < p < +\infty$.

**Acknowledgements.** We want to thank Daniel Galicer for useful comments, particularly for the one that motivated our Proposition [4.2].
