Figure S3 The effect of CYP2C8 metabolizer status on amodiaquine (AQ) and N-desethyl-amodiaquine (DEAQ) exposures following administration of atovaquone-proguanil (ATV-PG)/AQ or AQ.

Horizontal bars are the mean of the individual values. CYP2C8 metabolizer status was defined as extensive metabolizer (*1/*1), or intermediate metabolizer (*1/*2). Participants who experienced extrapyramidal adverse effects are shown by filled squares.
