Abstract

Objectives: This study investigated the relationship between viral load and the incidence and recovery of olfactory and gustatory dysfunction (OD and GD), incidence of respiratory and gastrointestinal symptoms in COVID-19 patients. Design: A Retrospective Cohort Study. Setting and Participants: In total 599 outpatients’ cases polymerase chain reaction (PCR)–confirmed COVID-19-positive patients in Golestan province were included in the study. Main Outcome Measures: The incidence of OD, GD, their severity and the time of recovery was determined. The association of these variables with cycle threshold (CT) values of SARS-CoV-2 polymerase chain reaction was assessed. Results: The mean age of patients was 38.27 ± 13.62 years. The incidence of general symptoms included myalgia 70.1%, headache 51.8%, fever 47.7%, and dyspnea 21.4%. 41.9% of patients had gastrointestinal symptoms, including abdominal pain 26.5%, diarrhea 25.2%, nausea 20.5%, and vomiting 12.9%. 12.2% of patients had comorbidity. The trimester recovery rates of OD and GD were 93.94% and 94.74%, respectively. The mean recovery time of OD and GD was 14.56 ± 13.37 and 13.8 ± 3.77 days, respectively. The mean CT value in all patients was 27.45 ± 4.55. There were significant associations between CT value with headache (P=0.04), GD (P=0.002) and OD (P=0.001). Conclusions: The intensity and the recovery of OD and GD in Covid-19 patients may be affected by initial viral load. Unlike to respiratory and gastrointestinal symptoms, the OD and GD were associated with lower viral load. Therefore, it may be recommended to use these clinical symptoms as an indicator in the initial screening of patients during pandemics.
