Abstract

We discuss pair production of stops, sbottoms, staus and tau–sneutrinos at a $\mu^+\mu^-$ collider. We present the formulae for the production cross sections and perform a detailed numerical analysis within the Minimal Supersymmetric Standard Model. In particular, we consider sfermion production near $\sqrt{s} = m_{H^0}$ and $\sqrt{s} = m_{A^0}$.

I. INTRODUCTION

The search for Supersymmetry (SUSY) [$^1$] is one of the main issues in the experimental programs at LEP2 and TEVATRON. It will play an even more important rôle at the future colliders LHC, $e^+e^-$ linear colliders with an energy range up to 2 TeV, and $\mu^+\mu^-$ colliders with an energy range up to 4 TeV. TEVATRON and LHC are well–designed to discover

*Present address: Instituto de Física Corpuscular – IFIC/CISC, Departament de Física Teórica, E-46100 Burjassot, Váncia, Spain
SUSY. At these machines even some precision measurements are possible \cite{3}. However, for a precise determination of the underlying SUSY parameters lepton colliders will be necessary. Owing to their good energy resolution $\mu^+\mu^-$ colliders are well suited for this purpose \cite{4,5}. The most exciting feature is the possibility of producing Higgs bosons in the $s$--channel \cite{4,6}.

In this paper we study the production of third generation sfermions in $\mu^+\mu^-$ annihilation, paying particular attention to the energy range near the Higgs boson resonances. Our framework is the Minimal Supersymmetric Standard Model (MSSM) \cite{2,7}. The MSSM implies the existence of five physical Higgs bosons: two scalars $h^0, H^0$, one pseudoscalar $A^0$, and two charged ones $H^\pm$ \cite{7,8}. Every Standard Model (SM) fermion has two supersymmetric partners, one for each chirality state denoted by $\tilde{f}_L$ and $\tilde{f}_R$.

The sfermions of the third generation are particularly interesting \cite{9-11} because their phenomenology is different compared to that of the sfermions of the first and second generation. The reasons for this are the mixing between $\tilde{f}_L$ and $\tilde{f}_R$ and the large Yukawa couplings.

In particular, the top quark and the stops give substantial contributions to Higgs boson masses due to radiative corrections (see e.g. \cite{12,13}). Moreover, the top and stop contributions to the renormalization group equations play an essential rôle in inducing electroweak symmetry breaking, when the Higgs parameters evolve from the GUT scale to the electroweak scale \cite{14}. Therefore, the couplings of the stops to the neutral Higgs bosons are of special interest. Also the tau and bottom Yukawa couplings can be large if $\tan\beta$ is large, giving rise to similar effects in the phenomenology of sbottoms and staus.

The paper is organized in the following way: In Sec. II we present the underlying parameters and give the formulae for the production cross sections. In Sec. III we discuss numerical results for sfermion pair production. In Sec. IV we summarize the main results. In the Appendix we give the Higgs sfermion couplings.
II. SFERMION PAIR PRODUCTION

In this section we present the formulae for sfermion mixing and the production cross sections of sfermions at a $\mu^+\mu^-$ collider. The main parameters for the following discussion are $m_{A^0}$, $\mu$, $\tan \beta$, $M_D$, $M_\tilde{Q}$, $M_\tilde{U}$, $M_\tilde{L}$, $A_b$, $A_t$, and $A_\tau$ \cite{4,7}. $m_{A^0}$ is the mass of the pseudoscalar Higgs boson, $\mu$ is the Higgs mixing parameter in the superpotential, and $\tan \beta = v_2/v_1$, where $v_i$ denotes the vacuum expectation value of the Higgs doublet $H_i$. $M_D$, $M_\tilde{Q}$, $M_\tilde{U}$, $M_\tilde{E}$ and $M_\tilde{L}$ are soft SUSY breaking masses for the sfermions, $A_b$, $A_t$, and $A_\tau$ are trilinear Higgs–sfermion parameters.

The mass matrix for sfermions in the $(\tilde{f}_L, \tilde{f}_R)$ basis has the following form:

$$M_f^2 = \begin{pmatrix} m_{\tilde{f}_L}^2 & a_f m_f \\ a_f m_f & m_{\tilde{f}_R}^2 \end{pmatrix}$$

(1)

with

$$m_{\tilde{t}_L}^2 = M_{\tilde{Q}}^2 + m_t^2 + m_Z^2 \cos 2\beta \left( \frac{1}{2} - \frac{2}{3} \sin^2 \theta_W \right),$$

$$m_{\tilde{t}_R}^2 = M_{\tilde{U}}^2 + m_t^2 + \frac{2}{3} m_Z^2 \cos 2\beta \sin^2 \theta_W,$$

$$m_{\tilde{b}_L}^2 = M_{\tilde{Q}}^2 + m_b^2 - m_Z^2 \cos 2\beta \left( \frac{1}{2} - \frac{1}{3} \sin^2 \theta_W \right),$$

$$m_{\tilde{b}_R}^2 = M_{\tilde{D}}^2 + m_b^2 - \frac{1}{3} m_Z^2 \cos 2\beta \sin^2 \theta_W,$$

$$m_{\tilde{\tau}_L}^2 = M_{\tilde{E}}^2 + m_\tau^2 - m_Z^2 \cos 2\beta \left( \frac{1}{2} - \sin^2 \theta_W \right),$$

$$m_{\tilde{\tau}_R}^2 = M_{\tilde{E}}^2 + m_\tau^2 - m_Z^2 \cos 2\beta \sin^2 \theta_W,$$

(2)

and

$$a_t = A_t - \mu \cot \beta,$$

$$a_b = A_b - \mu \tan \beta,$$

$$a_\tau = A_\tau - \mu \tan \beta.$$  

(3)

The mass eigenstates $\tilde{f}_1$ and $\tilde{f}_2$ are related to $\tilde{f}_L$ and $\tilde{f}_R$ by:

$$\begin{pmatrix} \tilde{f}_1 \\ \tilde{f}_2 \end{pmatrix} = \begin{pmatrix} \cos \theta_f & \sin \theta_f \\ -\sin \theta_f & \cos \theta_f \end{pmatrix} \begin{pmatrix} \tilde{f}_L \\ \tilde{f}_R \end{pmatrix}$$

(4)
with the eigenvalues
\[ m_{f_{1,2}}^2 = \frac{1}{2} \left( m_{f_L}^2 + m_{f_R}^2 \right) \mp \frac{1}{2} \sqrt{(m_{f_L}^2 - m_{f_R}^2)^2 + 4 a_f^2 m_f^2}. \] (5)

The mixing angle \( \theta_f \) is given by
\[
\cos \theta_f = \frac{-a_f m_f}{\sqrt{(m_{f_L}^2 - m_{f_R}^2)^2 + a_f^2 m_f^2}},
\]
\[
\sin \theta_f = \sqrt{\frac{(m_{f_L}^2 - m_{f_R}^2)^2}{(m_{f_L}^2 - m_{f_R}^2)^2 + a_f^2 m_f^2}}.
\] (6)

The mass of the tau–sneutrino is given by
\[ m_{\tilde{\nu}_\tau}^2 = M_{\tilde{L}}^2 - \frac{1}{2} m_Z^2 \cos 2\beta. \] (7)

Figure 1 shows the Feynman graphs for the processes \( \mu^+ \mu^- \to \tilde{f}_i \tilde{f}_j \) \( (i, j = 1, 2) \). The total and the differential cross sections read up to \( \mathcal{O}(m_\mu^2) \):
\[
\sigma(\mu^+ \mu^- \to \tilde{f}_i \tilde{f}_j) = c_{ij} \left[ \frac{4}{3} \frac{\lambda_{ij}}{s^2} T_{VV} + 2 \frac{m_{f_i}^2 - m_{f_j}^2}{s} T^a_{VH} + 2 T_{HH} \right],
\] (8)
\[
\frac{d \sigma(\mu^+ \mu^- \to \tilde{f}_i \tilde{f}_j)}{d \cos \vartheta} q = c_{ij} \left[ \frac{\lambda_{ij}}{s^2} T_{VV} \sin^2 \vartheta + \frac{m_{f_i}^2 - m_{f_j}^2}{s} T^a_{VH} + \frac{\lambda_{ij}^{1/2}}{s} T^b_{VH} \cos \vartheta + T_{HH} \right].
\] (9)

with the kinematic function \( \lambda_{ij} = (s - m_{f_i}^2 - m_{f_j}^2)^2 - 4m_{f_i}^2 m_{f_j}^2, \) \( \vartheta \) the scattering angle of \( \tilde{f}_i \),

and
\[ c_{ij} = \frac{\pi N_C \alpha^2}{4 s^2} \lambda_{ij}^{1/2}, \] (10)

where \( N_C \) is a colour factor which is 3 for squarks and 1 for sleptons.

\( T_{VV} \) denotes the contribution from \( \gamma \) and \( Z^0 \) exchange, \( T^a_{VH} \) the interference terms between gauge and Higgs bosons, and \( T_{HH} \) the contribution stemming from the exchange of Higgs bosons. The pure gauge boson contribution, the first term of Eqs. (8) and (9), is the same as for \( e^+ e^- \to \tilde{f}_i \tilde{f}_j \). Notice that the gauge boson term shows a \( \sin^2 \vartheta \) dependence whereas the terms proportional to \( T_{HH} \) and \( T^a_{VH} \) are independent of \( \vartheta \). The term proportional to \( T^b_{VH} \) shows a \( \cos \vartheta \) dependence giving rise to a forward–backward asymmetry. However, \( T^b_{VH} \) is proportional to \( m_\mu \) (see the following equations) and, therefore, is rather small.
are the vector and axial vector couplings of the muon to the Z boson, respectively. These couplings depend on $A_f$, $\mu$, $\tan \beta$, $\cos \theta_f$, $\cos \alpha$, where $\alpha$ is the mixing angle of $h^0$ and $H^0$. The explicit form of these couplings is given in the Appendix.

1) $i = j$

$$T_{VV} = e_f^2 \frac{e_f a_i v_\mu s}{8 \sin^2 \theta_W \cos^2 \theta_W} Re[D(Z)] + \frac{a_i^2 (v_\mu^2 + a_\mu^2) s^2}{256 \sin^4 \theta_W \cos^4 \theta_W} |D(Z)|^2,$$

$$T_{HH} = h_\mu^2 \frac{s}{2 e^2 \sin^2 \theta_W} \left| G^h_{ii} \sin \alpha D(h^0) - G^{H^0}_{ii} \cos \alpha D(H^0) \right|^2,$$

$$T_{VH}^a = 0,$$

$$T_{VH}^b = h_\mu m_\mu \frac{2 \sqrt{2}}{e \sin \theta_W} \left[ e_f Re[G^h_{ii} \sin \alpha D(h^0) - G^{H^0}_{ii} \cos \alpha D(H^0)] \right] - \frac{16 \sin^2 \theta_W \cos^2 \theta_W}{16} Re[D^*(Z)(G^h_{ii} \sin \alpha D(h^0) - G^{H^0}_{ii} \cos \alpha D(H^0))],$$

(11)

2) $i \neq j$

$$T_{VV} = \frac{a_i^2 (v_\mu^2 + a_\mu^2) s^2}{256 \sin^4 \theta_W \cos^4 \theta_W} |D(Z)|^2,$$

$$T_{HH} = h_\mu^2 \frac{s}{2 e^2 \sin^2 \theta_W} \left[ |G^h_{ij} \sin \alpha D(h^0) - G^{H^0}_{ij} \cos \alpha D(H^0)|^2 + \sin \beta G^{A_0}_{12} D(A^0)|^2 \right],$$

$$T_{VH}^a = -h_\mu m_\mu \frac{\sqrt{2} a_i a_j \alpha \sin \beta \cos \theta_f s}{8 e \sin^4 \theta_W} G^{A_0}_{12} Re[D^*(Z)D(A^0)],$$

$$T_{VH}^b = -h_\mu m_\mu \frac{\sqrt{2} v_\mu a_i s}{8 e \sin^4 \theta_W} Re[D^*(Z)(G^h_{ij} \sin \alpha D(h^0) - G^{H^0}_{ij} \cos \alpha D(H^0))],$$

(12)

where $h_\mu$ is the Yukawa coupling of the muon, $h_\mu = g m_\mu/(\sqrt{2} m_W \cos \beta)$, $D(i) = 1/((s - m_i^2) + i \Gamma, m_i)$; $e_f$ is the charge of the sfermions ($e_t = 2/3, e_b = -1/3, e_\tau = -1$) $v_\mu$ and $a_\mu$ are the vector and axial vector couplings of the muon to the Z boson, $v_\mu = -1 + 4 \sin^2 \theta_W$, $a_\mu = -1$, and $a_{ij}$ are the corresponding couplings $Z f_i f_j$:

$$a_{11} = 4(I^3_L f_i^2 \cos^2 \theta_f - \sin^2 \theta_W e_f),$$

$$a_{22} = 4(I^3_L f_i^2 \sin^2 \theta_f - \sin^2 \theta_W e_f),$$

$$a_{12} = a_{21} = -2I^3_L \sin 2 \theta_f,$$

(13)

where $I^3_L$ is the third component of the weak isospin of the fermion $f$. $G^h_{ij}, G^{H^0}_{ij}$, and $G^{A_0}_{ij}$ are the couplings of the sfermions $f_i$ and $f_j$ ($i, j = 1, 2$) to the light, the heavy, and the pseudoscalar Higgs boson, respectively. These couplings depend on $A_f$, $\mu$, $\tan \beta$, $\cos \theta_f$, $\cos \alpha$, where $\alpha$ is the mixing angle of $h^0$ and $H^0$. The explicit form of these couplings is given in the Appendix.
III. NUMERICAL RESULTS

In this Section we present the numerical results for sfermion production in the various channels. In this analysis we have taken: $\alpha(m_Z) = 1/129$, $\sin^2 \theta_W = 0.23$, $m_Z = 91.187$ GeV, $m_t = 175$ GeV, $m_b = 5$ GeV, and $m_{\mu} = 105.66$ MeV. For the calculation of the cross section we need the total decay widths of the Higgs bosons, where we calculate all possible two–body decay modes that are allowed at tree–level [16]. For this calculation we fix $M = 120$ GeV and use the GUT relation $M' = 5/3 \tan^2 \theta_W M$, where $M$ and $M'$ are the $SU(2)$ and $U(1)$ gaugino masses, respectively. As usual we have included radiative corrections in the calculation of $m_{h^0}$, $m_{H^0}$, and $\cos \alpha$ using [12].

In Fig. 2 we show the total cross sections for stop production as a function of $\sqrt{s}$ for $\mu = 300$ GeV, $\tan \beta = 3$, $m_{\tilde{t}_1} = 180$ GeV, $m_{\tilde{t}_2} = 260$ GeV, $\cos \theta_{\tilde{t}} = -0.556$, and $m_{A^0} = 450$ GeV. For the total widths of the Higgs bosons we take $m_{\tilde{b}_1} = 175$ GeV, $m_{\tilde{b}_2} = 195$ GeV, $\cos \theta_{\tilde{b}} = 0.9$, $M_{\tilde{L}} = 170$ GeV, $M_{\tilde{E}} = 150$ GeV, and $A_{\tau} = 300$ GeV. The full lines show the total cross sections and the dashed lines the gauge boson contributions. The latter ones are identical with the cross sections of $e^+e^- \rightarrow \tilde{t}_i \bar{\tilde{t}}_j$. For $\tilde{t}_1 \bar{\tilde{t}}_1$ production the peak results from the $H^0$ exchange leading to an enhancement of $\sim 40$ fb compared to the gauge boson contribution. For $\tilde{t}_1 \bar{\tilde{t}}_2$ production the peak is an overlap of the $H^0$ and $A^0$ resonances because $m_{A^0} \simeq m_{H^0}$ and the widths of $A^0$ and $H^0$ are of the order of several GeV (see e.g. [8,17,18]). Note that the Higgs boson contribution is much larger than the gauge boson contribution. We have found that the forward–backward asymmetry $A_{FB}$ is $\sim 10^{-4}$ at its maximum. Therefore, a rather high luminosity would be needed to measure it.

In Fig. 3 we show the production cross sections for $\mu^+\mu^- \rightarrow \tilde{t}_1 \bar{\tilde{t}}_1$ and $\mu^+\mu^- \rightarrow \tilde{t}_1 \bar{\tilde{t}}_2$ (without including the charge conjugate state) as a function of $\cos \theta_{\tilde{t}}$. We have chosen the following procedure for the calculation of the parameters: We fix $m_{\tilde{t}_1} = 180$ GeV, $m_{\tilde{t}_2} = 260$ GeV, $A_b = 300$ GeV, and $\mu$, $\tan \beta$, $m_{A^0}$, $M_{\tilde{L}}$, $M_{\tilde{E}}$, $A_{\tau}$ as above. We calculate $M_{\tilde{Q}}$, $M_{\tilde{U}}$, and $A_t$ from the stop masses and mixing angle. We take $M_{\tilde{D}} = 1.12 M_{\tilde{Q}}$ (we have checked, that our results are not sensitive to this assumption). These parameters are then
used for the calculation of \( m_{\tilde{b}_1}, m_{\tilde{b}_2}, \cos \theta_{\tilde{t}}, m_{\nu}, m_{H^0}, \cos \alpha, \Gamma_{H^0}, \) and \( \Gamma_{A^0}. \) We have chosen this procedure to minimize the dependence of the physical Higgs quantities on \( \cos \theta_{\tilde{t}}. \) In Fig. 3a we show the total cross section \( \sigma(\mu^+\mu^- \rightarrow \tilde{t}_1\tilde{\tau}_1), \) the Higgs boson contribution, and the gauge boson contribution for \( \sqrt{s} = 453 \) GeV. The Higgs boson contribution depends on the sign of \( \cos \theta_{\tilde{t}}. \) This leads to a dependence of the total cross section on the sign of \( \cos \theta_{\tilde{t}} \) contrary to the case of an \( e^+e^- \) collider, where the cross section depends only on \( \cos^2 \theta_{\tilde{t}}. \) Note that the Higgs boson contribution can be larger than the gauge boson contribution. This is in particular the case for large mixing in the stop sector because the Higgs boson couples more strongly to the left–right combination of the stops than to the left–left or right–right combinations. The Higgs boson contribution vanishes for \( \cos \theta_{\tilde{t}} \simeq -0.25 \) because the corresponding coupling is zero for the parameters chosen. One can disentangle the Higgs boson contribution from the gauge boson part by measuring the differential cross section. As can be seen in Eq. (9) the Higgs boson contribution of the differential cross section does not depend on \( \vartheta \) whereas the gauge boson contribution shows a \( \sin^2 \vartheta \) shape. We can safely neglect the interference terms between gauge and Higgs bosons because they are rather small as we have seen above. In Fig. 3b the total cross section is shown for various values of \( \sqrt{s} \) between 444 GeV and 454 GeV. For larger values of \( \sqrt{s} \) the cross section is decreasing because \( m_{H^0} \) varies between 452.8 GeV (\( \cos \theta_{\tilde{t}} \sim 0.71 \)) and 454.2 GeV (\( \cos \theta_{\tilde{t}} \sim -0.71 \)). The \( \cos \theta_{\tilde{t}} \) dependence of \( m_{H^0} \) is also the reason for \( \sigma(\sqrt{s} = 454) > (\sigma(\sqrt{s} = 453) \) if \( \cos \theta_{\tilde{t}} < (> - 0.25. \)

In Fig. 3c we show \( \sigma(\mu^+\mu^- \rightarrow \tilde{t}_1\tilde{t}_2), \) the Higgs boson contribution and the gauge boson contribution as a function of \( \cos \theta_{\tilde{t}}. \) An interesting feature here is that for \( \cos \theta_{\tilde{t}} = 0 \) only the Higgs bosons contribute. Moreover, the contribution of the Higgs bosons \( H_0 \) and \( A_0 \) is generally larger than that of the gauge boson. The total cross section again depends on the sign of \( \cos \theta_{\tilde{t}}. \) In Fig. 3d we show the total cross section for various values of \( \sqrt{s}. \) The shift of the peak is due the dependence of \( m_{H^0} \) and \( \cos \alpha \) on \( \tilde{A}_t \) which is calculated from \( \cos \theta_{\tilde{t}}. \) Note that the coupling \( H^0\tilde{t}_1\tilde{t}_2 \) is large in the range where the coupling \( H^0\tilde{t}_1\tilde{t}_1 \) is small and vice versa. The minima near \( |\cos \theta_{\tilde{t}}| \simeq 0.71 \) are due to the vanishing of the coupling \( H^0\tilde{t}_1\tilde{t}_2. \)
In Fig. 4 the cross sections for sbottom production are shown as a function of $\sqrt{s}$ for $m_{\tilde{b}_1} = 180$ GeV, $m_{\tilde{b}_2} = 230$ GeV, $m_{\tilde{t}_2} = 300$ GeV, $\cos \theta_\tilde{b} = 0.755$, $m_{\tilde{t}_1} = 160$ GeV, $m_{\tilde{t}_2} = 300$ GeV, $\cos \theta_{\tilde{t}} = 0.615$, $\mu = 291$ GeV, $\tan \beta = 8$, and $m_{A^0} = 450$ GeV. $M_{\tilde{L}}, M_{\tilde{E}},$ and $A_\tau$ are taken as above. It is interesting that $\sigma(\mu^+\mu^- \rightarrow \tilde{b}_1\tilde{b}_2)$ is $\sim 20$ times larger than $\sigma(e^+e^- \rightarrow \tilde{b}_1\tilde{b}_2)$ at $\sqrt{s} = m_{A^0}$. This has two implications: First, one gets a cross section that is large enough to be measured even with an integrated luminosity of $10$ fb$^{-1}$. Second, the $\tilde{b}_1\tilde{b}_2$ cross section is even larger than the $\tilde{b}_1\tilde{b}_1$ production cross section. Note that we only show the cross section for $\tilde{b}_1\tilde{b}_2$ whereas in the experiment one can measure the cross section of $\tilde{b}_1\tilde{b}_2 + \tilde{b}_1\tilde{b}_2$.

In Fig. 5 we show the cross sections for sbottom production as a function of $\cos \theta_{\tilde{b}}$ for $m_{\tilde{b}_1} = 180$ GeV, $m_{\tilde{b}_2} = 230$ GeV, $A_b = 300$ GeV, $m_{\tilde{t}_1} = 160$ GeV, $m_{\tilde{t}_2} = 300$ GeV, $\tan \beta = 8$, and $m_{A^0} = 450$ GeV. $M_{\tilde{L}}, M_{\tilde{E}},$ and $A_\tau$ are taken as above. We have calculated the other parameters in the following way: From $m_{\tilde{b}_1}, m_{\tilde{b}_2}, \cos \theta_{\tilde{b}},$ and $A_b$ we get $M_{\tilde{Q}}, M_{\tilde{D}},$ and $\mu$. We then take $M_{\tilde{Q}}, m_{\tilde{t}_1},$ and $m_{\tilde{t}_2}$ to calculate $M_{\tilde{U}}, \cos \theta_{\tilde{t}},$ and $A_t$. There are similarities to the stop case: For $\tilde{b}_1\tilde{b}_1$ production the Higgs boson contribution can be larger than the gauge boson part (Fig. 5a). In the case of $\tilde{b}_1\tilde{b}_2$ production, the contribution of the Higgs bosons is much larger than that of the gauge boson (Fig. 5c). The main difference compared to the stop case is that the asymmetry in the sign of $\cos \theta_{\tilde{b}}$ is much more pronounced in the $\tilde{b}_1\tilde{b}_2$ channel than in the $\tilde{b}_1\tilde{b}_1$ channel as a consequence of the corresponding couplings (Fig. 5b and d). The peak at $\cos \theta_{\tilde{b}} \simeq 0.71$ in Fig. 5d results not only from the couplings but also from the fact that the total decay width of $A^0$ has a minimum there.

In Fig. 6 the stau production cross sections are shown as a function of $\sqrt{s}$ for $m_{\tilde{\tau}_1} = 90$ GeV, $m_{\tilde{\tau}_2} = 127$ GeV, $\cos \theta_{\tilde{\tau}} = 0.594$, $M_{\tilde{Q}} = 300$ GeV, $M_{\tilde{U}} = 270$ GeV, $M_{\tilde{D}} = 330$ GeV, $A_t = A_b = 350$ GeV, $\mu = 300$ GeV, $\tan \beta = 8$, and $m_{A^0} = 220$ GeV. The parameters are chosen such that the Higgs boson cannot decay into squarks or the top quark. Therefore, the total decay widths of $H^0$ and $A^0$ are one order of magnitude smaller than in the previous examples. This leads to the large peaks at $\sqrt{s} = m_{A^0}, m_{H^0}$. Moreover, the decay widths are so small that one can see two peaks in the case of $\tilde{\tau}_1\tilde{\tau}_2$ production. It should be possible to observe both peaks in a real experiment because of the good energy resolution of a $\mu^+\mu^-$.
In Fig. 7 the cross sections for stau production are presented as a function of $\cos \theta_{\tilde{\tau}}$ for $m_{\tilde{\tau}_1} = 90 \text{ GeV}$, $m_{\tilde{\tau}_2} = 127 \text{ GeV}$, $A_\tau = 300 \text{ GeV}$, $\tan \beta$, $m_{A^0}$, and the squark parameters are taken as above. We have calculated $M_L$, $M_E$ and $\mu$ from $m_{\tilde{\tau}_{1,2}}$ and $\cos \theta_{\tilde{\tau}}$. With these and the other parameters we have calculated $m_{\tilde{\nu}_\tau}$, $m_{H^0}$, $\cos \alpha$, $\Gamma_{H^0}$, and $\Gamma_{A^0}$. Note that the masses, mixing angle, and decay widths of the Higgs bosons depend indirectly on $\cos \theta_{\tilde{\tau}}$ due to the induced change in $\mu$. This fact leads to the observed shifts of the maximal cross section with $\sqrt{s}$ in Fig. 7b and d. In $\tilde{\tau}_1 \tilde{\tau}_2$ production the Higgs boson contribution is much larger than the gauge boson contribution (Fig. 7c) similar to the squark production. This is particularly important, because in this case the production cross section is most likely too small to be seen at an $e^+ e^-$ collider [10,11]. The cross sections depend strongly on the sign of $\cos \theta_{\tilde{\tau}}$ in both channels (Fig. 7a and c). Note also that, for the parameters chosen in the Higgs couplings to the staus, the gauge couplings are of the same size as the Yukawa couplings (Eqs. (A10)–(A12)):

In Fig. 8 we show the total cross sections for sneutrino production as a function of $\sqrt{s}$ for the same parameters as in Fig. 7 (implying $m_{\tilde{\nu}_\tau} = 83.6 \text{ GeV}$). The large peak at $\sqrt{s} = m_{H^0}$ is due to the small total decay width of $H^0$ ($\Gamma_{H^0} \simeq 0.8 \text{ GeV}$) and due to the coupling $H^0 \tilde{\nu}_\tau \tilde{\nu}_\tau$ which is a gauge coupling (see Eq. (A9)) stemming from a D–term.

IV. SUMMARY

We have studied sfermion pair production in $\mu^+ \mu^-$ annihilation focusing on the impact of the Higgs boson resonances in these processes. We have seen that the production cross sections can be considerably enhanced at these resonances for all sfermions of the third generation. The most important results are: First, the production cross sections depend on the sign of $\cos \theta_{\tilde{f}}$. Second, the Higgs boson contributions dominate the production cross section of $\tilde{f}_1 \tilde{f}_2$. We have seen that the cross sections can be large enough to be studied at a $\mu^+ \mu^-$ collider even if the corresponding cross sections are too small to be measured at an collider [1].
$e^+ e^-$ collider. Third, the Higgs boson contribution can even be larger than the gauge boson contributions in the $\tilde{f}_1 \tilde{f}_1$ channel. From these facts we conclude that a $\mu^+ \mu^-$ collider is an excellent machine for obtaining important information on the $H^0 \tilde{f}_i \tilde{f}_j$ and $A^0 \tilde{f}_1 \tilde{f}_2$ couplings.

APPENDIX A: HIGGS COUPLINGS

In this section we list the couplings of the neutral Higgs bosons to sfermions. We concentrate here on the couplings of $H^0$ and $A^0$ which are important for our investigation. One can get the couplings of $h^0$ from those of $H^0$ by the replacements: $\cos \alpha \rightarrow -\sin \alpha$ and $\sin \alpha \rightarrow \cos \alpha$.

Higgs couplings to stops:

\begin{align}
G^{H^0}_{11} &= -\frac{m_Z}{4} \frac{\cos (\alpha + \beta)}{\cos \theta_W} - \frac{m_Z}{2} \left( \frac{1}{2} - \frac{4}{3} \sin^2 \theta_W \right) \cos (\alpha + \beta) \cos 2\theta_t \\
&\quad - \frac{m_t^2 \sin \alpha}{2 m_W \sin \beta} + \frac{m_t}{2 m_W \sin \beta} (\mu \cos \alpha - A_t \sin \alpha) \sin 2\theta_t, \\
G^{H^0}_{12} &= \frac{m_Z}{2} \left( \frac{1}{2} - \frac{4}{3} \sin^2 \theta_W \right) \cos (\alpha + \beta) \sin 2\theta_t \\
&\quad + \frac{m_t}{2 m_W \sin \beta} (\mu \cos \alpha - A_t \sin \alpha) \cos 2\theta_t, \\
G^{H^0}_{22} &= -\frac{m_Z}{4} \frac{\cos (\alpha + \beta)}{\cos \theta_W} + \frac{m_Z}{2} \left( \frac{1}{2} - \frac{4}{3} \sin^2 \theta_W \right) \cos (\alpha + \beta) \cos 2\theta_t \\
&\quad - \frac{m_t^2 \sin \alpha}{2 m_W \sin \beta} - \frac{m_t}{2 m_W \sin \beta} (\mu \cos \alpha - A_t \sin \alpha) \sin 2\theta_t, \\
G^{A^0}_{12} &= -G^{A^0}_{21} = \frac{m_t}{2 m_W} (A_t \cot \beta + \mu).
\end{align}
Higgs couplings to sbottoms:

\[ G_{11}^{H^0} = \frac{-m_Z \cos(\alpha + \beta)}{4 \cos \theta_W} - \frac{m_Z}{2 \cos \theta_W} \left( -\frac{1}{2} + \frac{2}{3} \sin^2 \theta_W \right) \cos(\alpha + \beta) \cos 2\theta_b \]

\[-m_b^2 \cos \alpha + \frac{m_b}{2 m_W \cos \beta} \left( \mu \sin \alpha - A_b \cos \alpha \right) \sin 2\theta_b, \quad \text{(A5)}\]

\[ G_{12}^{H^0} = \frac{m_Z}{2 \cos \theta_W} \left( -\frac{1}{2} + \frac{2}{3} \sin^2 \theta_W \right) \cos(\alpha + \beta) \sin 2\theta_b \]

\[ + \frac{m_b}{2 m_W \cos \beta} \left( \mu \sin \alpha - A_b \cos \alpha \right) \cos 2\theta_b, \quad \text{(A6)}\]

\[ G_{22}^{H^0} = \frac{-m_Z \cos(\alpha + \beta)}{4 \cos \theta_W} + \frac{m_Z}{2 \cos \theta_W} \left( -\frac{1}{2} + \frac{2}{3} \sin^2 \theta_W \right) \cos(\alpha + \beta) \cos 2\theta_b \]

\[-m_t^2 \cos \alpha - \frac{m_t}{2 m_W \cos \beta} \left( \mu \sin \alpha - A_t \cos \alpha \right) \sin 2\theta_t, \quad \text{(A7)}\]

\[ G_{12}^{A^0} = -G_{21}^{A^0} = \frac{m_b}{2 m_W} (A_b \tan \beta + \mu). \quad \text{(A8)}\]

Higgs coupling to the tau–sneutrino:

\[ G_{11}^{H^0} = -\frac{m_Z \cos(\alpha + \beta)}{2 \cos \theta_W}. \quad \text{(A9)}\]

Higgs couplings to staus:

\[ G_{11}^{H^0} = \frac{-m_Z \cos(\alpha + \beta)}{4 \cos \theta_W} - \frac{m_Z}{2 \cos \theta_W} \left( -\frac{1}{2} + \sin^2 \theta_W \right) \cos(\alpha + \beta) \cos 2\theta_\tau \]

\[-m_t^2 \cos \alpha + \frac{m_t}{2 m_W \cos \beta} \left( \mu \sin \alpha - A_\tau \cos \alpha \right) \sin 2\theta_\tau, \quad \text{(A10)}\]

\[ G_{12}^{H^0} = \frac{m_Z}{2 \cos \theta_W} \left( -\frac{1}{2} + \sin^2 \theta_W \right) \cos(\alpha + \beta) \sin 2\theta_\tau \]

\[ + \frac{m_t}{2 m_W \cos \beta} \left( \mu \sin \alpha - A_\tau \cos \alpha \right) \cos 2\theta_\tau, \quad \text{(A11)}\]

\[ G_{22}^{H^0} = \frac{-m_Z \cos(\alpha + \beta)}{4 \cos \theta_W} + \frac{m_Z}{2 \cos \theta_W} \left( -\frac{1}{2} + \sin^2 \theta_W \right) \cos(\alpha + \beta) \cos 2\theta_\tau \]

\[-m_t^2 \cos \alpha - \frac{m_t}{2 m_W \cos \beta} \left( \mu \sin \alpha - A_\tau \cos \alpha \right) \sin 2\theta_\tau, \quad \text{(A12)}\]

\[ G_{12}^{A^0} = -G_{21}^{A^0} = \frac{m_t}{2 m_W} (A_\tau \tan \beta + \mu). \quad \text{(A13)}\]

FIG. 1. Feynman graphs for sfermion production in $\mu^+\mu^-$ annihilation: a) for $\tilde{f}_i\tilde{f}_i$ ($i = 1, 2$), b) for $\tilde{f}_1\tilde{f}_2$. 
FIG. 2. Cross sections for stop production as a function of $\sqrt{s}$ for $m_{\tilde{t}_1} = 180$ GeV, $m_{\tilde{t}_2} = 260$ GeV, $\cos \theta_{\tilde{t}} = -0.556$, $m_{\tilde{b}_1} = 175$ GeV, $m_{\tilde{b}_2} = 195$ GeV, $\cos \theta_{\tilde{b}} = 0.9$, $\mu = 300$ GeV, $M = 120$ GeV, $\tan \beta = 3$, and $m_{A^0} = 450$ GeV. The full lines show the cross sections at a $\mu^+\mu^-$ collider and the dashed lines the corresponding ones at an $e^+e^-$ collider.
FIG. 3. Cross sections for stop production as a function of $\cos \theta_\tilde{t}$ for $m_{\tilde{t}_1} = 180$ GeV, $m_{\tilde{t}_2} = 260$ GeV, $A_b = 300$ GeV, $\mu = 300$ GeV, $M = 120$ GeV, $\tan \beta = 3$, and $m_{A_0} = 450$ GeV. In a) and c) $\sqrt{s} = 453$ GeV and the graphs correspond to: total cross section $\sigma_{tot}$ (full line), Higgs boson contribution $\sigma_H$ (dashed-dotted line), and gauge boson contribution $\sigma_V$ (dashed line). In b) and d) the cross section is shown for various $\sqrt{s}$ values (in GeV): 444, 448, 452, 454 (full lines) and 446, 450, 453 (dashed lines).
FIG. 4. Cross sections for sbottom production as a function of $\sqrt{s}$ for $m_{\tilde{b}_1} = 180$ GeV, $m_{\tilde{b}_2} = 230$ GeV, $\cos \theta_{\tilde{b}} = 0.755$, $m_{\tilde{t}_1} = 160$ GeV, $m_{\tilde{t}_2} = 300$ GeV, $\cos \theta_{\tilde{t}} = 0.615$, $\mu = 291$ GeV, $M = 120$ GeV, $\tan \beta = 8$, and $m_{A^0} = 450$ GeV.
FIG. 5. Cross sections for sbottom production as a function of \( \cos \theta_b \) for \( m_{b_1} = 180 \) GeV, \( m_{b_2} = 230 \) GeV, \( A_b = 300 \) GeV, \( m_{\tilde{t}_1} = 160 \) GeV, \( m_{\tilde{t}_2} = 300 \) GeV, \( M = 120 \) GeV, \( \tan \beta = 8 \), and \( m_{A_0} = 450 \) GeV. In a) and c) \( \sqrt{s} = 450 \) GeV and the graphs correspond to: total cross section \( \sigma_{\text{tot}} \) (full line), Higgs boson boson contribution \( \sigma_H \) (dashed-dotted line), and gauge boson contribution \( \sigma_V \) (dashed line). In b) and d) the cross section is shown for various \( \sqrt{s} \) values (in GeV): 444, 448, 451 (full lines) and 446, 450 (dashed lines). The gray area is excluded by LEP2 (\( m_{\tilde{\chi}^+_1} < 90 \) GeV).
FIG. 6. Cross sections for stau production as a function of $\sqrt{s}$ for $m_{\tilde{\tau}_1} = 90$ GeV, $m_{\tilde{\tau}_2} = 127$ GeV, $\cos \theta_{\tilde{\tau}} = 0.594$, $M_{\tilde{Q}} = 300$ GeV, $M_{\tilde{U}} = 270$ GeV, $M_{\tilde{D}} = 330$ GeV, $A_t = 350$ GeV, $A_b = 350$ GeV, $\mu = 300$ GeV, $M = 120$ GeV, $\tan \beta = 8$, and $m_{A^0} = 220$ GeV. The full lines show the cross sections at a $\mu^+ \mu^-$ collider and the dashed lines the corresponding ones at an $e^+ e^-$ collider.
FIG. 7. Cross sections for $\tilde{\tau}$ production as a function of $\cos\theta_{\tilde{\tau}}$ for $m_{\tilde{\tau}_1} = 90$ GeV, $m_{\tilde{\tau}_2} = 127$ GeV, $A_\tau = 300$ GeV, $M = 120$ GeV, $\tan\beta = 8$, and $m_{A_0} = 220$ GeV. In a) and c) $\sqrt{s} = 221$ GeV and the graphs correspond to: total cross section $\sigma_{\text{tot}}$ (full line), Higgs boson contribution $\sigma_{H}$ (dashed-dotted line), and gauge boson contribution $\sigma_{V}$ (dashed line). In b) and d) the cross section is shown for various $\sqrt{s}$ values (in GeV): 218, 220, 222 (full lines) and 219, 221 (dashed lines). The gray area is excluded by LEP2 ($m_{\tilde{\chi}_1^+} < 90$ GeV).
FIG. 8. Cross sections for sneutrino production as a function of $\sqrt{s}$ for $m_{\tilde{\nu}_\tau} = 83.6$ GeV and the other parameters as in Fig. 6. The full line shows the cross sections at a $\mu^+\mu^-$ collider and the dashed line the corresponding one at an $e^+e^-$ collider.
