Abstract

In planning for post mastectomy radiation for locally advanced breast cancer, it is important to ensure adequate coverage of the chest wall and regional nodal regions at risk. There is an area that is known to have dosimetric hot and cold spots in between the tangential field of radiation and the supraclavicular field. This is known as the “match line”. In this case report, we report a case of a patient with recurrence in the match line due to less dosage in this region. This is a good case to learn to always ensure adequate coverage in the match line when approving a plan to avoid local recurrence in this region.

Keywords: Breast cancer; Recurrence; Match line; Radiation

Introduction

Radiation therapy for locally advanced breast cancer is a local approach that has proven to not only improve local control but also increase overall survival. In patients with 4 or more lymph nodes positive, it has been known for years that they benefit from chest wall and regional nodal radiation followed by mastectomy. Patients with triple negative breast cancer are known to be at higher risk for recurrence and more aggressive tumors [1]. It is important to assure adequate coverage of the chest wall and regional lymph nodes when approving a plan in Radiation Oncology.

Case Presentation

A 52 year old female initially presented with abnormal screening mammogram which revealed a 2.4 cm mass in the left breast and palpable axillary tail mass. Ultrasound guided biopsy showed invasive ductal cancer, Grade III, ER, PR, Her-2 neu negative (triple negative). She underwent bilateral mastectomy and axillary dissection on the left. Pathology revealed a 3.5 cm mass with 7 positive axillary nodes out of 24 axillary nodes (stage IIIA, T2 N2a M0). She completed adjuvant chemotherapy followed by post mastectomy radiation to the chest wall and regional nodes to 50 gray in 25 fractions followed by a 10 gray boost to the scar.

One year later, she presented with increasing pain in her left arm without loss of movement. CT of the chest showed irregular round soft tissue density seen underneath the left pectoralis major muscle measuring approximately 1.5 by 1.7 cm. PET/CT revealed a hypermetabolic area that was suspicious for disease recurrence (Figure 1).

Discussion

This case shows a recurrence at the “match line” or region between the tangential field and supraclavicular field (Figure 2). It is important when reviewing radiation plans to ensure adequate coverage in this region. Most believe that at least 45 gray is needed to eradicate microscopic nodal disease [2]. A higher dose of radiation is needed if extracapsular nodal extension is seen on pathology. In this case, there was not adequate coverage at the “match line” between the supraclavicular field (Figure 3) and the tangential field (Figure 4), which led to a recurrence in this exact location. In the era of CT guided radiation treatment planning, it is also recommended to contour the axillary nodal levels to ensure adequate coverage.
Figure 3: Supraclavicular field with contoured recurrence inferior to supraclavicular field. As shown in Figure 3, the supraclavicular field covered the traditional supraclavicular nodes but failed to cover the region where the recurrence was seen directly below the supraclavicular field.

Figure 4: Tangential chest wall field with recurrence contoured in red superior to the field. As shown in Figure 4, the tangential field covered the chest wall but failed to cover the region where the recurrence was seen directly above the tangent field.

OMICS International: Publication Benefits & Features

Unique features:
- Increased global visibility of articles through worldwide distribution and indexing
- Showcasing recent research output in a timely and updated manner
- Special issues on the current trends of scientific research

Special features:
- 700 Open Access Journals
- 50,000 Editorial team
- Rapid review process
- Quality and quick editorial, review and publication processing
- Indexing at PubMed (pantent), Szapu, EBSCO, Index Copernicus, Google Scholar etc.
- Sharing Option: Social Networking Enabled
- Authors, Reviewers and Editors rewarded with online Scientific Credits
- Better discount for your subsequent articles

Submit your manuscript at: http://www.omicsonline.org/submission
