Abstract: We present generalisations of N-extended supersymmetry algebras in four dimensions, using Lorentz covariance and invariance under permutation of the N supercharges as selection criteria.
I Introduction

Recent developments in string theory have revealed the need to study generalisations of supersymmetry which lie beyond the realm of existing classifications of spacetime supersymmetry algebras. Spacetime supersymmetry algebras are $\mathbb{Z}_2$-graded super Lie algebras $\mathfrak{g} = \mathfrak{g}_0 \oplus \mathfrak{g}_1$ having even $\mathfrak{g}_0$ and odd $\mathfrak{g}_1$ subspaces, where the even part $\mathfrak{g}_0 = \langle M \rangle \oplus \langle P \rangle \oplus \mathfrak{h}$ includes the generators of spacetime Lorentz transformations $M$, translations $P$ and a subspace of additional ‘internal symmetries’ $\mathfrak{h}$. The usual relation between spin and statistics implies that generators of $\mathfrak{g}_1$ transform as half-integer spin representations under the Lorentz transformations. Traditional classifications of spacetime supersymmetries were based on assumptions arising from the additional requirement that the supersymmetries act on either S-matrix elements [1] or on some physical Hilbert space of particle states [2]. In particular these restrict the maximum spin of the generators to be one and require the internal symmetries to be ‘central’ in the sense that they commute with all other generators. Moreover, in four dimensional space-time, the realisation of these algebras on physical states restricts finite dimensional representations to contain fields of spin less than or equal to two and the maximal number $N$ of independent supercharges in $\mathfrak{g}_1$ to eight.

There are several instances in which spacetime supersymmetries and representations more general than those allowed in traditional settings occur. In M-theory, for instance, the internal symmetries $\mathfrak{h}$ do not commute with the Lorentz generators (see e.g. [3]). In $N$-extended super self-dual theories in four dimensional Euclidean space, finite dimensional representations containing fields of spin higher than two do occur and there are consistent theories for any choice of $N$ [4]. In $N=2$ string theory [5], the absence of the usual relation between spin and statistics gives rise to a realisation of a purely even variant of supersymmetry [6] on an infinite dimensional space of string states. There are indications that this statistics-twisted version of supersymmetry is related to an $N \to \infty$ extension of the super Poincaré algebra, which has a realisation on an $N=\infty$ self-dual Yang-Mills supermultiplet [4]. These examples show that there seems to be room for the study of more general superalgebras containing the ($N$-extended) super Poincaré algebra or the super de Sitter algebra as a subalgebra or as a contraction. The work of Fradkin and Vasiliev (e.g. [7]) on higher spin superalgebras on anti de Sitter space is also noteworthy in this respect. The present paper is a further contribution in this direction.

In a series of recent papers [8] we recently developed an approach to the study of generalised super-Poincaré algebras containing generators having spins higher than one. We showed that, contrary to common belief, such superalgebras indeed exist and are realisable
in terms of vector fields on generalised superspaces having coordinates of higher spin which
commute or anticommute in accordance with their statistics. We constructed numerous
examples of generalised superalgebras with generators having spins up to two.

In the present paper, we address ourselves to another type of generalisation, concerning
the question of higher multiplicities of certain representations in the superalgebra. Theories
with $N$ supercharges are of special interest. In these, there does not seem to be any principle
which distinguishes some of the supercharges from the others and field theories containing
such supercharges are usually taken to be invariant under permutation of the supercharges.
In this paper, we impose this permutation invariance at the level of the superalgebra, intro-
ducing what we will call *democratic superalgebras*. Our purpose here is not a complete
classification of possibilities; rather, we aim to show that under the imposition of democracy, even in the widely familiar four-dimensional case, an investigation of super Jacobi
identities yields some potentially interesting democratic spacetime superalgebras which lie
beyond known classifications. The main novel feature which arises in our approach is that
the algebra of Lorentz scalars $h$ generated by the superderivations is no longer either Abelian
or in the centre of $g$. Although democracy implies the Coleman-Mandula requirement \cite{9}
that the scalars commute with (even) translations, they possibly rotate spinor derivations
among themselves.

\section{Democratic Superalgebras}

\subsection{Four dimensional spacetime supersymmetry}

Since our aim is to generalise traditional discussions and since our considerations are purely
algebraic, we restrict ourselves to the general complex setting. The question of the app-
propriate real form depends in any case on the signature of the space-time on which the
superalgebra is to be realised; and this depends on the specific context of the application.
We consider the Lorentz group to be $\text{SO}(4,\mathbb{C})$, with complex generators $M_{\alpha\beta}, M_{\dot{\alpha}\dot{\beta}}$, where
there is of course no conjugation between dotted and undotted spinor indices.

We shall consider $\mathbb{Z}_2$-graded $N$-extended complex supersymmetry algebras of the form
$\mathfrak{g} = \mathfrak{g}_0 \oplus \mathfrak{g}_1$, with even part

$$\mathfrak{g}_0 = \langle M_{\alpha\beta}, M_{\dot{\alpha}\dot{\beta}}, \nabla_{\alpha\dot{\alpha}} \rangle \oplus h,$$   \hfill (1)
where \( \nabla_{\alpha \dot{\alpha}} \) denotes the derivative vector fields generating translations, and \( \mathfrak{h} \) is the subspace of internal symmetries
\[
\mathfrak{h} = \langle Y^i, Z^{ij} = -Z^{ji}; \sum_i Y^i = 0, \sum_i Z^{ij} = 0, i, j = 1, \ldots N \rangle,
\]
spanned by a set of Lorentz scalar generators, \((N-1)\ Y\)'s and \((N-1)(N-2)/2\ Z\)'s.

The odd subspace \( \mathfrak{g}_1 \) is spanned by \( N \) copies of the two types of spinor representations of \( \text{so}(4, \mathbb{C}) \), namely the \( 2N \) fermionic operators \( \nabla_i^{a}, \nabla_i^{\dot{a}} \) \((i = 1, \ldots, N)\), which together with the bosonic vectorial operator \( \nabla_{\alpha \dot{\alpha}} \), form the set of superderivations acting on an \( N \)-extended superspace. We denote the vector space of superderivations
\[
\mathcal{D} = \langle \nabla_{\alpha \dot{\alpha}}, \nabla_i^a, \nabla_i^{\dot{a}} \rangle = \mathcal{D}_0 \oplus \mathcal{D}_1,
\]
where the even and odd parts are spanned by the vector and spinor derivations respectively. The vector space \( \mathcal{D} \) may be extended to include vector fields having higher spins on the lines of the consideration in \([8]\). For simplicity, however, we restrict ourselves here, to the consideration of operators having spin less than or equal to one.

We shall assume that all the elements in \( \mathfrak{g} \) have commutation or anticommutation relations in agreement with their statistics and with covariance under the Lorentz transformations with generators \( M_{\alpha \beta}, M_{\dot{\alpha} \dot{\beta}}, \alpha, \beta, \dot{\alpha}, \dot{\beta} = 1, 2 \) satisfying
\[
\begin{align*}
\left[ M_{\alpha \beta}, M_{\gamma \delta} \right] &= \epsilon_{\beta \gamma} M_{\alpha \delta} + \epsilon_{\alpha \gamma} M_{\beta \delta} + \epsilon_{\beta \delta} M_{\alpha \gamma} + \epsilon_{\alpha \delta} M_{\beta \gamma}, \\
\left[ M_{\dot{\alpha} \dot{\beta}}, M_{\gamma \delta} \right] &= \epsilon_{\beta \gamma} M_{\dot{\alpha} \dot{\delta}} + \epsilon_{\dot{\alpha} \gamma} M_{\beta \dot{\delta}} + \epsilon_{\beta \delta} M_{\dot{\alpha} \gamma} + \epsilon_{\dot{\alpha} \delta} M_{\beta \gamma}, \\
\left[ M_{\alpha \beta}, M_{\dot{\alpha} \dot{\beta}} \right] &= 0,
\end{align*}
\]
Lorentz covariance, in particular, determines all commutators of the basic operators with the \( M \), namely
\[
\begin{align*}
\left[ M_{\alpha \beta}, \nabla_i^a \right] &= \epsilon_{\alpha \gamma} \nabla_i^\beta + \epsilon_{\beta \gamma} \nabla_i^\alpha, \quad \left[ M_{\alpha \beta}, \nabla_i^{\dot{a}} \right] = 0, \quad \left[ M_{\alpha \beta}, Y_i \right] = 0, \quad \left[ M_{\alpha \beta}, Z^{ij} \right] = 0, \\
\left[ M_{\dot{\alpha} \dot{\beta}}, \nabla_i^a \right] &= \epsilon_{\dot{\alpha} \gamma} \nabla_i^\beta + \epsilon_{\dot{\beta} \gamma} \nabla_i^\dot{\alpha}, \quad \left[ M_{\dot{\alpha} \dot{\beta}}, \nabla_i^{\dot{a}} \right] = 0, \quad \left[ M_{\dot{\alpha} \dot{\beta}}, Y_i \right] = 0, \quad \left[ M_{\dot{\alpha} \dot{\beta}}, Z^{ij} \right] = 0.
\end{align*}
\]
Given these commutation rules, all Jacobi identities involving at least two \( M \)'s are automatically satisfied. Lorentz covariance also yields restrictions on the (anti)commutators of any two elements of \( \mathfrak{g} \). These guarantee that the Jacobi identities involving at least one \( M \) are also automatically satisfied.
The spinor derivations $\nabla^i_\alpha$, $\nabla^i_\dot{\alpha}$ are taken to transform under some group of automorphisms $T$ of the superalgebra $\mathfrak{g}$:

$$T \nabla^i_\alpha T^{-1} = U^i_j \nabla^j_\alpha, \quad T \nabla^i_\dot{\alpha} T^{-1} = V^i_j \nabla^j_\dot{\alpha}, \quad (5)$$

where the matrices $U, V$ are representations of the group element $T$. In this paper, we make particular use of discrete transformations, taking $U$ and $V$ to be permutation matrices on the index $i$. When the automorphism group is continuous, the action of the group can be expressed in the form of commutation relations with the generators of the group: for instance the scalar generators $Y$ or $Z$ which appear in (32)-(37).

We shall also allow the possibility of generating scalars by anticommuting spinor derivations, e.g. $\{ \nabla^i_\alpha, \nabla^j_\beta \} \sim \epsilon_{\alpha\beta} Z^{ij}$. Traditionally [1], such Lorentz scalars are always taken to be central with respect to $\mathcal{D}$. In our approach we do not a priori restrict the Lorentz scalars to be central. In fact they rotate the spinor derivations $\nabla^i_\alpha, \nabla^i_\dot{\alpha}$ just as the automorphisms (5). This is the main source of our novel examples of spacetime supersymmetries.

II.2 Democracy

II.2.1 Permutation invariants

We shall impose what we call democracy: we require the supercommutation relations to be invariant under the combined permutations of the $i$-indices of $\nabla^i_\alpha$ and of $\nabla^i_\dot{\alpha}$. The group generating democracy $S_N$ is the diagonal group of two groups of permutations acting independently on the two sets of spinors, with permutation matrices $U = V$ in (3).

The Clebsch-Gordon coefficients of the democratic group may be described as follows. The permutation invariant coupling among $p$ ($p > 1$) $i$ type indices can be associated to Young-type diagrams. Given a Young diagram with $p$ ($p > 0$) boxes denoted $[m] = [m_1, m_2, \ldots, m_p]$, with $m_j$ boxes in the $j$-th row ($\sum_j m_j = p$, $m_{i+1} \leq m_i$), we associate to it a $p$-index tensor $\theta^{i_1i_2\ldots i_p}_{[m_1m_2\ldots m_p]}$ defined by

$$\theta^{i_1i_2\ldots i_p}_{[m_1m_2\ldots m_p]} m_1 \cdots m_2 \cdots m_3 k_1 \cdots k_{m_3} \cdots = 1 \quad \text{if } i_1 = \ldots = i_{m_1}, \ j_1 = \ldots = j_{m_2}, \ k_1 = \ldots = k_{m_3}, \ \ldots$$

$$= 0 \quad \text{otherwise} \quad (6)$$

Note that these tensors clearly do not have the standard Young diagram symmetries. From these $\theta$ tensors, by permuting indices, all the invariant tensors of the permutation group can
be constructed. For a Young-type diagram with \( p \) boxes, if \( n_l \) is the number of rows having length \( m_k = l \), the number of independent invariant tensors is given by \( p!/(\prod_k m_k! \prod_l n_l!) \).

Some of these tensors have a simple interpretation in terms of the familiar Kronecker tensor \( \delta^{ij} \). In particular

\[
\begin{align*}
\theta^{ij}_{[2]} &= \delta^{ij} \\
\theta^{ijkl}_{[22]} &= \delta^{ij} \delta^{kl} \\
\theta^{ijklmn}_{[222]} &= \delta^{ij} \delta^{kl} \delta^{mn}
\end{align*}
\]

(7)
correspond to the invariant tensors of \( so(N) \). These are special cases of the identities

\[
\theta^{i_1 \ldots i_{m_1} i_{m_1+1} \ldots i_{m_1+m_2} \ldots} = \theta^{i_1 \ldots i_{m_1}} \theta^{i_{m_1+1} \ldots i_{m_1+m_2} \ldots} \theta^{i_{m_3} \ldots} \quad .
\]

(8)
One further useful identity (with summation over repeated indices assumed) is

\[
\theta^{i}_{[1]} \theta^{ijk \ldots}_{[m]} = \theta^{ijk \ldots}_{[m-1]} \quad ,
\]

(9)
which is valid for all \( m > 0 \) if we define

\[
\theta^{i}_{[0]} := N \quad .
\]

(10)

II.2.2 Trace conditions

We note that the tensor \( \theta^{i}_{[1]} \) can be used to decompose tensors into their permutation irreducible parts. In particular, a vector \( V^i \) has two irreducible components given by the scalar projection \( S \)

\[
S = \theta^{i}_{[1]} V^j
\]

(11)
and its complementary piece, of dimension \( N-1 \),

\[
Y^j = V^i - \frac{1}{N} \theta^{i}_{[1]} S \quad .
\]

(12)
Similarly, a general antisymmetric tensor \( T^{ij} \) can be decomposed under the permutation group into two irreducible pieces. A piece of the form \( Y^j \) is obtained by the projection

\[
Y^j = \theta^{i}_{[1]} T^{ij} \quad ,
\]

(13)
which satisfies

\[
\theta^{i}_{[1]} Y^j = 0 \quad .
\]

(14)
The other irreducible piece $Z^{ij}$, of dimension $(N-1)(N-2)/2$, can be defined by

$$Z^{ij} = T^{ij} - \frac{1}{N} \left( \theta^{[i} Y^{j]} - \theta^{[i} Y^{j]} \right)$$

(15)

and satisfies

$$\theta^{[i} Z^{ij} = 0.$$  

(16)

We will generically call conditions imposed on the structure constants which guarantee the irreducibility of the relevant tensors trace conditions. The tensors $Y$ in (12) and $Z$ in (15) will be called trace-free.

Since the $Y^k$ and the $Z^{kl}$ need to satisfy the trace-free conditions (16) and (14), it is convenient to use some partially trace-free combinations of the invariant $\theta$-tensors with certain symmetries

\[
t^{ij}_{[2]} := \theta^{ij}_{[2]} - \frac{1}{N} \theta^{ij}_{[11]},
\]

\[
t^{ijk}_{[21]} := \theta^{ijk}_{[21]} - \frac{1}{N} \theta^{ijk}_{[111]},
\]

\[
t^{ijk}_{[3]} := \theta^{ijk}_{[3]} - \frac{1}{N} \left( \theta^{kji}_{[21]} + \theta^{ijk}_{[21]} + \theta^{ikj}_{[21]} \right),
\]

\[
t^{ijkl}_{[22]} := \theta^{ijkl}_{[22]} - \theta^{jkl}_{[22]} - \frac{1}{N} \left( \theta^{ijkl}_{[211]} - \theta^{jkl}_{[211]} - \theta^{ijkl}_{[211]} + \theta^{jkl}_{[211]} \right)
\]

\[
+ \frac{1}{N} \left( \theta^{jml}_{[221]} - \theta^{jml}_{[221]} + \theta^{jml}_{[221]} - \theta^{jml}_{[221]} + \theta^{jml}_{[221]} - \theta^{jml}_{[221]} \right)
\]

\[
- \frac{3}{N} \left( \theta^{jml}_{[211]} - \theta^{jml}_{[211]} - \theta^{jml}_{[211]} - \theta^{jml}_{[211]} \right)
\]

\[
t^{jknml}_{[32]} := \theta^{jknml}_{[32]} - \theta^{knml}_{[22]} - \theta^{knml}_{[22]} - \theta^{jknml}_{[22]} + \theta^{jknml}_{[22]} + \theta^{jknml}_{[22]} - \theta^{jknml}_{[22]}
\]

\[
- \frac{1}{N} \left( \theta^{jknml}_{[221]} - \theta^{jknml}_{[221]} - \theta^{jknml}_{[221]} + \theta^{jknml}_{[221]} + \theta^{jknml}_{[221]} - \theta^{jknml}_{[221]} \right)
\]

\[
- \theta^{jknml}_{[221]} + \theta^{jknml}_{[221]} - \theta^{jknml}_{[221]} + \theta^{jknml}_{[221]} + \theta^{jknml}_{[221]} - \theta^{jknml}_{[221]}
\]

\[
+ \theta^{jknml}_{[221]} - \theta^{jknml}_{[221]} + \theta^{jknml}_{[221]} - \theta^{jknml}_{[221]} + \theta^{jknml}_{[221]} - \theta^{jknml}_{[221]} \right). 
\]

These satisfy the useful identities

\[
t^{jinm}_{[22]} + t^{jmin}_{[22]} \equiv 0 
\]

(18)

\[
t^{jknml}_{[22]} + t^{jknml}_{[22]} \equiv 0 
\]

(19)
\[
\begin{align*}
t^{ij\,k}\,_{l}\,_{m}\,_{[2]} - t^{kj\,i}\,_{l}\,_{m}\,_{[2]} - \frac{1}{2} t^{knip\,t^pjm}\,_{m}\,_{n}\,_{[2]} & \equiv 0 \\
t^{minl\,k}\,_{l}\,_{p}\,_{m}\,_{[22]} - t^{mjnl\,k}\,_{l}\,_{p}\,_{m}\,_{[22]} + \frac{1}{2} t^{ikjl\,mpknq}\,_{l}\,_{p}\,_{q}\,_{m}\,_{n}\,_{[222]} & \equiv 0 \\
t^{ijk\,k}\,_{m}\,_{n}\,_{[3]} - t^{njk\,k}\,_{i}\,_{m}\,_{n}\,_{[3]} + \frac{1}{2N} t^{pijq}\,_{m}\,_{n}\,_{j}\,_{q}\,_{[22]} & \equiv 0 \\
t^{kmjn}\,_{[22]} + t^{jnk}\,_{j}\,_{m}\,_{[22]} + t^{imjn}\,_{i}\,_{m}\,_{n}\,_{[22]} & \equiv 0 \\
t^{ipkrmln}\,_{[222]} + t^{kpmn}\,_{j}\,_{m}\,_{n}\,_{[222]} + t^{jkmn}\,_{i}\,_{m}\,_{n}\,_{[222]} & \equiv 0.
\end{align*}
\]

II.3 The supercommutators of the superderivations

Using the invariant \( \theta \) and \( t \) tensors, the most general permutation invariant and Lorentz covariant supercommutation relations of the superderivations may be expressed,

\[
\{ \nabla^i_{\alpha}, \nabla^j_{\beta} \} = \left( a_2 t^{ij}_{[2]} + a_{11} \theta^{ij}_{[1]} \right) \nabla^i_{\alpha} \nabla^j_{\beta}.
\]

\[
\{ \nabla^i_{\alpha}, \nabla^j_{\beta} \} = \left( b_2 t^{ij}_{[2]} + b_{11} \theta^{ij}_{[1]} \right) M_{\alpha\beta} + \epsilon_{\alpha\beta} b_{21} \left( t^{ijkl}_{[21]} - t^{ijkl}_{[21]} \right) Y^k
\]
\[
+ \epsilon_{\alpha\beta} b_{22} t^{ijkl}_{[22]} Z^{kl}.
\]

\[
\{ \nabla_{\alpha}^i, \nabla_{\beta}^j \} = \left( \bar{b}_2 t^{ij}_{[2]} + \bar{b}_{11} \theta^{ij}_{[1]} \right) M_{\alpha\beta} + \epsilon_{\alpha\beta} \bar{b}_{21} \left( t^{ijkl}_{[21]} - t^{ijkl}_{[21]} \right) Y^k
\]
\[
+ \epsilon_{\alpha\beta} \bar{b}_{22} t^{ijkl}_{[22]} Z^{kl},
\]

\[
\left[ \nabla^i_{\alpha}, \nabla_{\beta}^j \right] = \epsilon_{\alpha\beta} \left( c_2 t^{ij}_{[2]} + c_{11} \theta^{ij}_{[1]} \right) \nabla^j_{\beta}
\]

\[
\left[ \nabla^i_{\alpha}, \nabla_{\beta}^j \right] = \epsilon_{\alpha\beta} \left( \bar{c}_2 t^{ij}_{[2]} + \bar{c}_{11} \theta^{ij}_{[1]} \right) \nabla^j_{\beta}
\]

\[
\left[ \nabla_{\alpha}^i, \nabla_{\beta}^j \right] = r \left( \epsilon_{\alpha\beta} M_{\alpha\beta} + \epsilon_{\alpha\beta} M_{\alpha\beta} \right).
\]

Comments:

a) The equations involving \( Y^i \) and \( Z^{ij} = -Z^{ji} \) on the right hand side have been written so as to exhibit manifestly the irreducibility of these operators. In particular, use of the partially trace-free invariant tensors as coefficients automatically yields \( Y^i \) satisfying \((14)\) and \( Z^{ij} \) satisfying \((16)\), since using these tensors guarantees that the relevant term vanishes when one replaces \( Z^{kl} \) by \( \theta_{[1]}^k V^l \) and independently \( Y^k \) by \( \theta^k S \).

b) For the \( \nabla^i_{\alpha} \) and the \( \nabla^i_{\alpha} \), we have not separated the permutation-irreducible tensors explicitly. However, the tensors \( t \) from \((17)\) have been chosen to correspond to the decomposition into the irreducible pieces.
c) That the two terms on the right-hand-side of (30) always have the same coefficient, can be easily deduced from the Jacobi identity for three $\nabla_{a\dot{a}}$'s. The parameter $r$ distinguishes the two main classes of supersymmetry algebras we shall consider: The contraction to the $r = 0$ case corresponds to the algebras of super-Poincaré type and for $r \neq 0$ we obtain algebras of super de Sitter type. We shall not consider algebras of superconformal type, which have a second element transforming as a Lorentz vector, the generator of conformal transformations.

d) The right hand sides involve the most general Lorentz covariant terms. This guarantees that Jacobi identities involving one $M$ are automatically satisfied.

e) The fifteen complex parameters $\{a_2, a_{11}\}, \{b_2, b_{11}, b_{21}, b_{22}\}, \{c_2, c_{11}\}, \{\bar{c}_2, \bar{c}_{11}\}$, and $\{r\}$ are a priori independent. They are to be chosen so as to satisfy the super Jacobi identities, which we shall consider in the next section.

II.4 The action of $h$ on the superderivations

The most general commutation relations of the Lorentz scalar operators $Y$ and $Z$ with the superderivations compatible with Lorentz and permutation covariance, e.g.

$$[Y^i, \nabla^j_{\alpha}] = \left( d_3 t^{ijk}_{[3]} + d_2 t^{ijk}_{[21]} + d_2 t^{ijk}_{[21]} + d_1 t^{ijk}_{[11]} \right) \nabla^k_{\alpha},$$

on imposition of the trace conditions, yield the following eight-parameter set of relations involving the partially trace-free tensors (L7):

$$[Y^i, \nabla^j_{\dot{\alpha}}] = \left( d_3 t^{ijk}_{[3]} + d_2 t^{ijk}_{[21]} + d_2 t^{ijk}_{[21]} + d_1 t^{ijk}_{[11]} \right) \nabla^k_{\dot{\alpha}},$$

$$[Y^i, \nabla^j_{\alpha}] = 0$$

$$[Z^{ij}, \nabla^k_{\alpha}] = f^{ikl}_{[22]} \nabla^l_{\alpha}$$

$$[Z^{ij}, \nabla^k_{\dot{\alpha}}] = \bar{f}^{ikl}_{[22]} \nabla^l_{\dot{\alpha}}$$

$$[Z^{ij}, \nabla^k_{\alpha}] = 0.$$  (37)

We note that the Coleman-Mandula type relation, $[h, D_0] = 0$, is an immediate consequence of the trace conditions. However, the internal symmetry can still act non-trivially on the odd derivations.
II.5 The commutators in $\mathfrak{h}$

The subalgebra of the $Y$'s and $Z$'s has the Lorentz and permutation covariant form satisfying the trace-conditions:

$$[Y^i, Y^j] = g_{22} t^{imjn}_{[22]} Z^{mn}$$  \hspace{1cm} (38)

$$[Z^{ij}, Y^k] = h_{22} t^{ijkl}_{[22]} Y^l + h_{32} t^{ijkl}_{[32]} Z^{lm}$$  \hspace{1cm} (39)

$$[Z^{ij}, Z^{kl}] = k_{222} t^{ijknil}_{[222]} Z^{mn}.$$  \hspace{1cm} (40)

In fact the Jacobi identities always imply that $h_{32} = 0$ (see below). This reduces the number of parameters to the three, which are constrained by the Jacobi identities.

III Democratic Lie algebras $\mathfrak{g}$

The a priori Lorentz covariant commutators of our $N$-extended democratic algebras must satisfy super Jacobi identities which guarantee that the products of the underlying operators are associative. We shall now consider the constraints imposed on the parameters in (25)-(30), (32)-(37), (38)-(40) by the super Jacobi identities. Let us first recall that, by construction, all the Jacobi identities involving at least one $M$ are automatically satisfied. We begin with the subalgebra $\mathfrak{h}$.

III.1 Democratic Lie algebras $\mathfrak{h}$

To find all possible $S_N$ democratic algebras containing the $N(N-1)/2$ generators $Y$ and $Z$, the Jacobi identities for (38)-(40) need to be satisfied. These yield the following four conditions on the four parameters $g_{22}, h_{22}, h_{32}, k_{222}$:

$$h_{32} h_{22} = h_{32} k_{222} = 0$$

$$h_{22} (h_{22} - 2k_{222}) = 0$$

$$N g_{22} (h_{22} - 2k_{222}) - 2h_{32}^2 = 0.$$  \hspace{1cm} (41)

They generally imply that $h_{32} = 0$, leaving the conditions

$$h_{22} (h_{22} - 2k_{222}) = 0$$

$$g_{22} (h_{22} - 2k_{222}) = 0.$$  \hspace{1cm} (42)
These equations lead to a classification in five distinct categories:

1a. Abelian $\mathfrak{h}$: all the scalar operators commute

$$g_{22} = h_{22} = k_{222} = 0 \quad (43)$$

and the $Y$ and $Z$ can still be renormalised freely.

1b. The $Z$’s commute, they commute with the $Y$’s but the commutators of the $Y$’s generate the $Z$’s. By renormalisation of the $Z$’s or the $Y$’s, we find

$$g_{22} = 1 \quad , \quad h_{22} = k_{222} = 0 \quad . \quad (44)$$

2. The $Z$’s form an $so(N-1)$ algebra, with $N-1$ commuting $Y$’s which moreover are $so(N-1)$ scalars, i.e. do not transform under the $Z$. Using the normalisation freedom, we may write

$$g_{22} = h_{22} = 0 \quad , \quad k_{222} = 1 \quad . \quad (45)$$

3a. The inhomogeneous $so(N-1)$ case. By normalisation of the $Z$’s, the parameters can be brought to

$$g_{22} = 0 \quad , \quad h_{22} = 2 \quad , \quad k_{222} = 1 \quad . \quad (46)$$

The $Y$’s behave as a vector under $so(N-1)$ and commute. They behave as momenta with respect to $so(N-1)$ and hence this corresponds to an inhomogeneous $so(N-1)$ algebra. The normalisations of the $Y$’s can still be adjusted freely.

3b. The $so(N)$ case. We clearly have as many $Y$ and $Z$ operators as there are generators of $so(N)$, which is indeed a particular democratic Lie algebra $\mathfrak{h}$. In this case, by suitable renormalisations of the $Y$’s and the $Z$’s, the parameters can be brought to their $so(N)$ values, which we normalise as:

$$g_{22} = 1 \quad , \quad h_{22} = 2 \quad , \quad k_{222} = 1 \quad . \quad (47)$$

That these values correspond to $so(N)$ can be seen as follows. The commutation relations of the $N(N-1)/2$ generators $M^{ij} = M^{ji}$ of $so(N)$ are usually written as,

$$[M^{ij}, M^{kl}] = \theta^{jk}_{[2]} M^{il} - \theta^{ik}_{[2]} M^{jl} - \theta^{jl}_{[2]} M^{ik} + \theta^{il}_{[2]} M^{jk} .$$

Defining projections

$$V^j = \theta^k_{[1]} M^{kj}$$
$$T^{jk} = M^{jk} - \frac{1}{N} \left( \theta^i_{[1]} V^k \theta^k_{[1]} V^j \right) , \quad (48)$$
we obtain that the subset of the $T$ operators alone form a democratic $so(N-1)$ subalgebra (with $(N-1)(N-2)/2$ independent operators) of the $so(N)$ algebra. The $N-1$ independent $V$ operators transform as a vector under the $so(N-1)$ subalgebra. The $V$ and the $T$ satisfy precisely the commutation relations (38)-(40) satisfied by $Y$ and $Z$ respectively with

$$g_{22} = -\frac{N}{2} , \quad h_{22} = 1 , \quad k_{222} = \frac{1}{2} .$$

Since there are possible arbitrary democratic rescalings of $V$ with respect to $Y$ and of $T$ with respect to $Z$, the algebra of the $Y$’s and the $Z$’s corresponds to an $so(N)$ algebra provided (47) holds.

### III.2 Supersymmetry algebras $\mathfrak{g}$

The full discussion for the rest of the super Jacobi identities is rather intricate. We discuss the full set of solutions in the appendix, discussing the main features here.

We have chosen to discuss the general solution of the Jacobi identities in terms of two criteria:

1. the first criterion is related to the appearance of the term $\theta^{ij}_{[2]} \nabla^{\alpha} \alpha$ in the anticommutators of $\nabla^i_\alpha$ with $\nabla^j_\alpha$ (parameter $a_2$) and of the $Y$’s in the anticommutator of two $\nabla^a$’s (parameter $b_{21}$) or of two $\nabla^\alpha$’s (parameter $\overline{b}_{21}$).

2. the second criterion reveals the structure of the algebra $\mathfrak{h}$ of the Lorentz scalar elements as discussed in the preceding section.

We use the values of the parameters $a_2$, $b_{21}$ and $\overline{b}_{21}$ as the basis of our classification. It follows from (25), (26) and (27) that, if any of these three parameters is non zero, it may be renormalised to one by rescaling the three superderivations democratically. Hence, using also the fact that we have a natural symmetry under the interchange of the dotted and undotted operators, we are led to six independent classes of superalgebras:

| Class | $a_2$ | $b_{21}$ | $\overline{b}_{21}$ |
|-------|-------|---------|-------------------|
| A     | 1     | 1       | 1                 |
| B     | 1     | 1       | 0                 |
| C     | 0     | 1       | 1                 |
| D     | 1     | 0       | 0                 |
| E     | 0     | 1       | 0                 |
| F     | 0     | 0       | 0                 |

(50)
which we discuss in detail in the Appendix. Classes $B$ and $E$ are *chiral*, not having the mirror symmetry under the chirality interchanges between dotted and undotted indices ($\alpha \leftrightarrow \dot{\alpha}, \ldots$) and between the parameters $c \leftrightarrow \bar{c}, \ldots$ (for existing unbarred-barred pairs). The two further classes

\[
\text{Class B': } a_2 = 1, \ b_{21} = 0, \ \bar{b}_{21} = 1 \\
\text{Class E': } a_2 = 0, \ b_{21} = 0, \ \bar{b}_{21} = 1
\]  

(51)
can clearly be obtained trivially from the $B$ and $E$ classes by performing the above chirality exchanges; and we do not explicitly discuss these.

Within the above classes, the discussion is subdivided according to the values of $k_{222}$ and $h_{22}$, corresponding to the division in section III.1.

Case 1 : $k_{222} = 0, \ h_{22} = 0$
Case 2 : $k_{222} = 1, \ h_{22} = 0$
Case 3 : $k_{222} = 1, \ h_{22} = 2$  

(52)

### III.3 Some solutions of the super Jacobi Identities

In this section, we discuss the main noteworthy features revealed by our approach. Let us consider Case A3 from the appendix:

\[
\{\nabla^i, \nabla^j\} = \left(t^{ij}_{[2]} + a_{11}\theta^{ij}_{[11]}\right) \nabla_{\alpha\dot{\alpha}}  
\]  

(53)

\[
\{\nabla^i, \nabla^j_{\dot{\beta}}\} = 4 \left(b_{22}t^{ij}_{[2]} + a_{11}\bar{b}_{22}\theta^{ij}_{[11]}\right) M_{\alpha\beta} + \epsilon_{\alpha\beta} \left(t^{ikj}_{[21]} - t^{jki}_{[21]}\right) Y^k + b_{22}t^{ikj}_{[2]} Z^{kl}  
\]  

(54)

\[
\{\nabla^i_{\dot{\alpha}}, \nabla^j_{\dot{\beta}}\} = 4 \left(b_{22}t^{ij}_{[2]} + a_{11}\bar{b}_{22}\theta^{ij}_{[11]}\right) M_{\dot{\alpha}\dot{\beta}} + \epsilon_{\dot{\alpha}\dot{\beta}} \left(t^{ikj}_{[21]} - t^{jki}_{[21]}\right) Y^k + \bar{b}_{22}t^{ikj}_{[2]} Z^{k\dot{l}}  
\]  

(55)

\[
\left[ \nabla^i_{\alpha}, \nabla^j_{\beta}\right] = 4\epsilon_{\alpha\beta} \left(b_{22}t^{ij}_{[2]} + \bar{b}_{22}\theta^{ij}_{[11]}\right) \nabla^j_{\beta}  
\]  

(56)

\[
\left[ \nabla^i_{\dot{\alpha}}, \nabla^j_{\dot{\beta}}\right] = 4\epsilon_{\dot{\alpha}\dot{\beta}} \left(\bar{b}_{22}t^{ij}_{[2]} + b_{22}\theta^{ij}_{[11]}\right) \nabla^j_{\beta}  
\]  

(57)

\[
\left[ \nabla^i_{\alpha\dot{\alpha}}, \nabla^j_{\alpha\dot{\alpha}}\right] = 16b_{22}\bar{b}_{22} \left(\epsilon_{\alpha\beta}M_{\dot{\alpha}\dot{\beta}} + \epsilon_{\dot{\alpha}\dot{\beta}}M_{\alpha\beta}\right)  
\]  

(58)

\[
\left[ \nabla^i_{\alpha\dot{\alpha}}, \nabla^j_{\alpha\dot{\alpha}}\right] = 0  
\]  

(59)
\[
\left[ Z_{ij}, \nabla_{\alpha\dot{\alpha}} \right] = 0 \quad (60)
\]
\[
\left[ Y^i, \nabla_{\dot{\alpha}} \right] = 4 \left( b_{22} a_{11} t^{ikj}_{[2]} - \frac{b_{22} t^{ijk}_{[2]}}{N_{[21]}} \right) \nabla^k_{\alpha} \quad (61)
\]
\[
\left[ Y^i, \nabla_{\alpha} \right] = 4 \left( b_{22} a_{11} t^{ikj}_{[2]} - \frac{b_{22} t^{ijk}_{[2]}}{N_{[21]}} \right) \nabla^k_{\dot{\alpha}} \quad (62)
\]
\[
\left[ Z_{ij}, \nabla_{\alpha} \right] = 2 t^{jkl}_{[22]} \nabla^l_{\alpha} \quad (63)
\]
\[
\left[ Z_{ij}, \nabla_{\dot{\alpha}} \right] = 2 t^{jkl}_{[22]} \nabla^l_{\dot{\alpha}} \quad (64)
\]
\[
\left[ Y^i, Y^j \right] = -4 a_{11} b_{22} t^{imjn}_{[22]} Z^{mn} \quad (65)
\]
\[
\left[ Z_{ij}, Y^k \right] = 2 t^{jkl}_{[22]} Y^l \quad (66)
\]
\[
\left[ Z_{ij}, Z^{kl} \right] = t^{jklmn}_{[222]} Z^{mn} \quad . \quad (67)
\]

The main unusual features displayed by this algebra are:

1) non-trivial action of the subalgebra $\mathfrak{h}$ on the vector space of superderivations $\mathcal{D}$,

2) nonabelian subalgebra of the Lorentz scalar generators,

3) occurrence of the $a_{11}$ term in (53).

The above example is of super de Sitter type. A chiral super Poincaré type example, also displaying these interesting features, is given by Case B3:

\[
\left\{ \nabla^i_{\alpha}, \nabla^j_{\dot{\alpha}} \right\} = \left( t^{ij}_{[2]} + a_{11} \theta^{ij}_{[11]} \right) \nabla_{\alpha\dot{\alpha}} \quad (68)
\]
\[
\left\{ \nabla^i_{\dot{\alpha}}, \nabla^j_{\beta} \right\} = \left( 4 b_{22} t^{ij}_{[2]} + N c_{11} a_{11} \theta^{ij}_{[11]} \right) M_{\alpha\beta}
+ \epsilon_{\alpha\beta} \left( \left( t^{ikj}_{[2]} - t^{jki}_{[2]} \right) Y^k + b_{22} t^{ikjl}_{[22]} Z^{kl} \right) \quad (69)
\]
\[
\left\{ \nabla^i_{\dot{\alpha}}, \nabla^j_{\dot{\alpha}} \right\} = 0 \quad (70)
\]
\[
\left[ \nabla^i_{\alpha}, \nabla^j_{\dot{\beta}} \right] = \epsilon_{\alpha\beta} \left( 4 b_{22} t^{ij}_{[2]} + c_{11} \theta^{ij}_{[11]} \right) \nabla^j_{\dot{\beta}} \quad (71)
\]
\[
\left[ \nabla^i_{\dot{\alpha}}, \nabla^j_{\dot{\beta}} \right] = 0 \quad (72)
\]
\[
\left[ \nabla^i_{\alpha\dot{\alpha}}, \nabla^j_{\beta} \right] = 0 \quad (73)
\]
\[
\left[ Y^i, \nabla_{\alpha\dot{\alpha}} \right] = 0 \quad (74)
\]
\[
\left[ Z_{ij}, \nabla_{\alpha\dot{\alpha}} \right] = 0 \quad (75)
\]
\[ [Y^i, \nabla^j_\alpha] = \left( -\frac{4}{N} b_{22} t_{[21]}^{ijk} + N a_{11} c_{11} t_{[21]}^{ikj} \right) \nabla^k_\alpha \] (76)
\[ [Y^i, \nabla^j_\dot{\alpha}] = \left( -c_{11} t_{[21]}^{ijk} + 4 a_{11} b_{22} t_{[21]}^{ikj} \right) \nabla^k_\dot{\alpha} \] (77)
\[ [Z^{ij}, \nabla^k_\alpha] = 2 t_{[22]}^{ijk} \nabla^l_\alpha \] (78)
\[ [Z^{ij}, \nabla^k_\dot{\alpha}] = 2 t_{[22]}^{ijk} \nabla^l_\dot{\alpha} \] (79)
\[ [Y^i, Y^j] = -N a_{11} c_{11} b_{22} t_{[22]}^{imjn} Z^{mn} \] (80)
\[ [Z^{ij}, Y^k] = 2 t_{[22]}^{jkil} Y^l \] (81)
\[ [Z^{ij}, Z^{kl}] = t_{[22]}^{jkmln} Z^{mn} . \] (82)

IV Conclusion

The inclusion of multiplicities in our programme [8], extending in a Lorentz covariant way the algebra of coordinates and derivatives, has been shown to exhibit interesting new features and a rather rich structure of solutions for the super-Jacobi identities. In order to obtain explicit solutions, we have chosen to restrict ourselves in this article to a set of operators of spin less than or equal to one and to impose democracy. Within these restricted hypotheses, we have been able to classify fully the allowed superalgebras of derivations and superderivations. Apart from the well-known examples [1, 2], new and potentially interesting cases have been uncovered.

Acknowledgements

This work has been supported in part by the TMR European Network “Integrability, non-perturbative effects and symmetry in quantum field theory” (contract number FMRX-CT96-0012). One of the authors (J.N.) wishes to thank the Theory Division at CERN where part of this work was carried through in April 2000 and the other (C.D.) thanks the MPI für Mathematik, Bonn and the Sonderforschungsbereich SFB 256, Mathematisches Institut der Universität Bonn for hospitality during the performance of this work.
Appendix

With classes (A-F) defined in [50] and subcases (1-3) defined by [52] the full classification of the democratic supersymmetry algebras is given below.

Class A

Imposing the super Jacobi identities together with the class A constraints, \(a_2 = 1\), \(b_{21} = 1\), \(\tilde{b}_{21} = 1\), yields the relations

\[
\{\nabla_i, \nabla_j\} = \left( t_{ij}^{[2]} + a_{11} \theta_{ij}^{[11]} \right) \nabla_{\alpha \dot{\alpha}} \tag{A1}
\]

\[
\{\nabla_i, \nabla_j\} = 4k_{222} \left( b_{22} t_{ij}^{[2]} + a_{11} \tilde{b}_{22} \theta_{ij}^{[11]} \right) M_{\alpha \beta} + \epsilon_{\alpha \beta} \left( t_{ijk}^{(21)} - t_{ikj}^{(21)} \right) Y^k + b_{22} t_{ij}^{ikjl} Z^{kl} \tag{A2}
\]

\[
\{\nabla_i, \nabla_j\} = 4k_{222} \left( \tilde{b}_{22} t_{ij}^{[2]} + a_{11} b_{22} \theta_{ij}^{[11]} \right) M_{\alpha \dot{\beta}} + \epsilon_{\alpha \dot{\beta}} \left( t_{ijk}^{(21)} - t_{ikj}^{(21)} \right) Y^k + \tilde{b}_{22} t_{ij}^{ikjl} Z^{kl} \tag{A3}
\]

\[
\left[ \nabla_i, \nabla_j \right] = 4 \epsilon_{\alpha \beta} k_{222} \left( b_{22} t_{ij}^{[2]} + \frac{\tilde{b}_{22} b_{22} \theta_{ij}^{[11]}}{N} \right) \nabla_j \tag{A4}
\]

\[
\left[ \nabla_i, \nabla_j \right] = 4 \epsilon_{\alpha \beta} k_{222} \left( b_{22} t_{ij}^{[2]} + \frac{\tilde{b}_{22} b_{22} \theta_{ij}^{[11]}}{N} \right) \nabla_j \tag{A5}
\]

\[
\left[ \nabla_{\alpha \dot{\alpha}}, \nabla_{\beta \dot{\beta}} \right] = 16 b_{22} \tilde{b}_{22} k_{222}^2 \left( \epsilon_{\alpha \beta} M_{\alpha \beta} + \epsilon_{\alpha \dot{\beta}} M_{\alpha \dot{\beta}} \right) \tag{A6}
\]

\[
[Y^i, \nabla_{\alpha \dot{\alpha}}] = 0 \tag{A7}
\]

\[
[Z^{ij}, \nabla_{\alpha \dot{\alpha}}] = 0 \tag{A8}
\]

\[
[Y^i, \nabla_{\alpha \dot{\alpha}}] = 4k_{222} \left( \tilde{b}_{22} a_{11} t_{ij}^{ikjl} - \frac{b_{22} b_{22} \theta_{ij}^{[11]}}{N} t_{ij}^{ikjl} \right) \nabla^k \tag{A9}
\]

\[
[Y^i, \nabla_{\alpha \dot{\alpha}}] = 4k_{222} \left( b_{22} a_{11} t_{ij}^{ikjl} - \frac{\tilde{b}_{22} b_{22} \theta_{ij}^{[11]}}{N} t_{ij}^{ikjl} \right) \nabla^k \tag{A10}
\]

\[
[Z^{ij}, \nabla^l_{\alpha}] = h_{222} t_{ij}^{jkl} \nabla^l_{\alpha} \tag{A11}
\]

\[
[Z^{ij}, \nabla^l_{\alpha}] = h_{222} t_{ij}^{jkl} \nabla^l_{\alpha} \tag{A12}
\]

\[
[Y^i, Y^j] = -4 a_{11} b_{22} \tilde{b}_{22} k_{222} t_{[22]}^{imjn} Z^{mn} \tag{A13}
\]

\[
[Z^{ij}, Y^k] = h_{222} t_{ij}^{jkl} Y^l \tag{A14}
\]

\[
[Z^{ij}, Z^{kl}] = k_{222} t_{[22]}^{ijkm} Z^{mn} \tag{A15}
\]
with the space of class A superalgebras defined by solutions of the system of quadratic equations

\[ b_{22}(2k_{222} - h_{22}) = 0 \]
\[ \overline{b}_{22}(2k_{222} - h_{22}) = 0 \]
\[ h_{22}(2k_{222} - h_{22}) = 0 . \]  

We find three subcases (see (52))

**Case A1** Since \( h_{22} = k_{222} = 0 \), the parameters \( a_{11}, b_{22} \) and \( \overline{b}_{22} \) are free. This includes the standard super Poincaré algebra with abelian algebra \( \mathfrak{h} \) of central charges.

**Case A2** Here \( a_{11} \) is free, \( k_{222} = 1 \) and all other parameters are zero. There is an \( so(N-1) \) subalgebra (see (45)) of the \( Z \)'s which decouples.

**Case A3** This is a much less trivial case (see section III.3) and the full \( so(N) \) algebra (49) is included in the algebra. The independent parameters are \( a_{11}, b_{22}, \overline{b}_{22} \) while \( h_{22} = 2, k_{222} = 1 \).

**Class B**

This class is chiral of super Poincaré type: \( a_2 = 1, b_{21} = 1, \overline{b}_{21} = 0 \). It has relations

\[ \{\nabla^i_\alpha, \nabla^j_\beta\} = \left( t^{ij}_{[2]} + a_{11} \theta^{ij}_{[11]} \right) \nabla^{}_{\alpha\beta} \]  

(B1)

\[ \{\nabla^i_\alpha, \nabla^j_\beta\} = \left( 4b_{22}k_{222}t^{ij}_{[2]} + Nc_{11}a_{11} \theta^{ij}_{[11]} \right) M_{\alpha\beta} \]

\[ + \epsilon_{\alpha\beta} \left( t^{ikj}_{[2]} - t^{jki}_{[2]} \right) Y^k + b_{22}t^{ijl}_{[22]} Z^{kl} \]  

(B2)

\[ \{\nabla^i_\alpha, \nabla^j_\beta\} = \epsilon_{\alpha\beta} b_{22}t^{ijk}_{[22]} Z^{kl} \]  

(B3)

\[ [\nabla^i_\alpha, \nabla^j_\beta] = \epsilon_{\alpha\beta} \left( 4b_{22}k_{222}t^{ij}_{[2]} + c_{11} \theta^{ij}_{[11]} \right) \nabla^j_\beta \]  

(B4)

\[ [\nabla^i_\alpha, \nabla^j_\beta] = 0 \]  

(B5)

\[ [\nabla^i_\alpha, \nabla^j_\beta] = 0 \]  

(B6)

\[ [Y^i, \nabla^j_\alpha] = 0 \]  

(B7)

\[ [Z^{ij}, \nabla^j_\alpha] = 0 \]  

(B8)

\[ [Y^i, \nabla^j_\alpha] = \left( -\frac{4}{N}b_{22}k_{222}t^{ijk}_{[2]} + Na_{11}c_{11}t^{ij}_{[2]} \right) \nabla^k_\alpha \]  

(B9)
\[ \begin{align*}
\left[ Y^i, \nabla^j_\alpha \right] &= \left( -c_{11} t^{ijk}_{[21]} + 4a_{11} b_{22} k_{222} t^{ijk}_{[21]} \right) \nabla^k_\alpha \\
\left[ Z^{ij}, \nabla^k_\alpha \right] &= h_{22} t^{ijk}_{[22]} \nabla^l_\alpha \\
\left[ Z^{ij}, \nabla^k_\alpha \right] &= h_{22} t^{ijk}_{[22]} \nabla^l_\alpha \\
\left[ Y^i, Y^j \right] &= -N a_{11} c_{11} b_{22} t^{imjn}_{[22]} Z^{mn} \\
\left[ Z^{ij}, Y^k \right] &= h_{22} t^{ijk}_{[22]} Y^l \\
\left[ Z^{ij}, Z^{kl} \right] &= k_{222} t^{ijkl}_{[22]} Z^{mn} 
\end{align*} \] (B10)

Here the parameters are constrained by the system of equations
\[
\begin{align*}
\bar{b}_{22} h_{22} &= \bar{b}_{22} k_{222} = 0 \\
b_{22} (2k_{222} - h_{22}) &= 0 \\
h_{22} (2k_{222} - h_{22}) &= 0 
\end{align*} \] (B16)

defining the space of class B superalgebras. They are all of chiral super-Poincaré type. There are three subcases of solutions (see (52))

**Case B1** The parameters \(a_{11}, b_{22}, \bar{b}_{22}\) and \(c_{11}\) are free, \(h_{22} = k_{222} = 0\). The \(Z\)’s are central, not the \(Y\)’s.

**Case B2** The parameters \(a_{11}\), and \(c_{11}\) are free, \(k_{222} = 1\) and the remaining are zero. The subalgebra \(\mathfrak{h}\) contains the \(so(N-1)\) of the \(Z\)’s which decouples. The subalgebra of the \(Y\)’s is abelian.

**Case B3** The parameters \(a_{11}, b_{22},\) and \(c_{11}\) are free, \(h_{22} = 2, k_{222} = 1, \bar{b}_{22} = 0\) (see III.3).

**Class C**

This class contains super algebras of de Sitter type. They allow contractions to super Poincaré type algebras by setting \(c_2\) and/or \(\bar{c}_2\) to zero. The relations \(a_2 = 0, b_{21} = 1, \bar{b}_{21} = 1\) yield the superbrackets
\[
\begin{align*}
\{ \nabla^i_\alpha, \nabla^j_\alpha \} &= a_{11} \theta_{[11]}^{ij} \nabla_{\alpha \delta} \nabla_{\alpha \delta} \\
\{ \nabla^i_\alpha, \nabla^j_\beta \} &= a_{11} \bar{c}_2 \theta_{[11]}^{ij} M_{\alpha \beta} + \epsilon_{\alpha \beta} \left( t_{[21]}^{ijk} - t_{[21]}^{jki} \right) Y^k + b_{22} t_{[22]}^{ijk} \nabla^{kl} \\
\{ \nabla^i_\alpha, \nabla^j_\beta \} &= a_{11} c_2 \theta_{[11]}^{ij} M_{\alpha \beta} + \epsilon_{\alpha \beta} \left( t_{[21]}^{ijk} - t_{[21]}^{jki} \right) Y^k + \bar{b}_{22} t_{[22]}^{ijk} \nabla^{kl} 
\end{align*} \]
\[
\begin{align*}
\left[ \nabla_\alpha^i, \nabla_\beta \cdot \right] &= \epsilon_{\alpha\beta} \left( c_2 t^{ij}_{[2]} + \frac{c_2}{N} \delta^{ij}_{[11]} \right) \nabla_\beta^j \\
\left[ \nabla_\alpha^i, \nabla_\beta \cdot \right] &= \epsilon_{\alpha\beta} \left( \overline{c}_2 t^{ij}_{[2]} + \frac{\overline{c}_2}{N} \delta^{ij}_{[11]} \right) \nabla_\beta^j \\
\left[ \nabla_\alpha^i, \nabla_\beta \cdot \right] &= c_2 \overline{c}_2 \left( \epsilon_{\alpha\beta} M_{\alpha\beta} + \epsilon_{\alpha\beta} M_{\alpha\beta} \right)
\end{align*}
\]

(C4) 

\[
\begin{align*}
\left[ Y^i, \nabla_\alpha \cdot \right] &= 0 \\
\left[ Z^{ij}, \nabla_\alpha \cdot \right] &= 0 \\
\left[ Y^i, \nabla_\alpha \right] &= a_{11} c_2 t^{ij}_{[2]} \nabla_\alpha^k \\
\left[ Z^{ij}, \nabla_\alpha \right] &= h_{22} t^{ij}_{[2]} \nabla_\alpha^k \\
\left[ Y^i, Y^j \right] &= -a_{11} b_{22} \overline{c}_2 t^{imjn}_{[2]} Z^{mn} \\
\left[ Z^{ij}, Y^k \right] &= h_{22} t^{ij}_{[2]} Y^l \\
\left[ Z^{ij}, Z^{kl} \right] &= k_{222} t^{ijkl}_{[2]} Z^{mn}.
\end{align*}
\]

(C9) 

(C10) 

(C11) 

(C12) 

(C13) 

(C14) 

(C15) 

Here the parameters are constrained by the system of equations

\[
\begin{align*}
\overline{b}_{22} c_2 - b_{22} \overline{c}_2 &= 0 \\
b_{22} h_{22} &= b_{22} k_{222} = 0 \\
\overline{b}_{22} h_{22} &= \overline{b}_{22} k_{222} = 0 \\
a_{11} \overline{c}_2 b_{22} (2 k_{222} - h_{22}) &= 0 \\
h_{22} (2 k_{222} - h_{22}) &= 0.
\end{align*}
\]

(C16) 

We find three subcases (see [52]):

**Case C1** We have \( h_{22} = k_{222} = 0 \) while \( a_{11} \) is free and \( b_{22}, \overline{b}_{22}, c_2, \overline{c}_2, \) are constrained by the condition

\[
\overline{b}_{22} c_2 = b_{22} \overline{c}_2.
\]

(C17) 

The \( Z \)'s are central charges.

**Case C2** The parameters \( a_{11}, c_2, \overline{c}_2 \) are free, \( k_{222} = 1 \) and the remaining are zero. The subalgebra \( so(N-1) \subset \mathfrak{h} \) of the \( Z \)'s decouples.

**Case C3** The parameters \( a_{11}, c_2, \overline{c}_2 \) are free, \( h_{22} = 2, k_{222} = 1 \) and \( b_{22} = \overline{b}_{22} = 0 \).
Class D

This has $a_2 = 1$, $b_{21} = 0$, $\mathfrak{b}_{21} = 0$, yielding

\[
\{\nabla^i_\alpha, \nabla^j_\beta\} = \left(t^{ij}_{[2]} + a_{11} \theta^{ij}_{[11]}\right) \nabla_{\alpha \beta} \tag{D1}
\]

\[
\{\nabla^i_\alpha, \nabla^j_\beta\} = \epsilon_{\alpha \beta} b_{22} t^{ikj}_{[22]} Z^{kl} \tag{D2}
\]

\[
\{\nabla^i_\alpha, \nabla^j_\beta\} = \epsilon_{\alpha \beta} \mathfrak{b}_{22} t^{ikj}_{[22]} Z^{kl} \tag{D3}
\]

\[
\left[\nabla^i_\alpha, \nabla^j_{\beta \gamma}\right] = 0 \tag{D4}
\]

\[
\left[\nabla^i_{\alpha \beta}, \nabla^j_{\beta \gamma}\right] = 0 \tag{D5}
\]

\[
\left[\nabla^i_{\alpha \beta}, \nabla^j_{\beta \gamma}\right] = 0 \tag{D6}
\]

\[
[Y^i, \nabla^j_{\alpha \beta}] = 0 \tag{D7}
\]

\[
[Z^{ij}, \nabla^k_{\alpha \beta}] = 0 \tag{D8}
\]

\[
[Y^i, \nabla^j_{\alpha}] = \left(d_3 t^{ijk}_{[3]} + a_{21} t^{ijk}_{[21]} - N \mathfrak{d}^{ij}_{21} a_{11} \right) \nabla^k_\alpha \tag{D9}
\]

\[
[Y^i, \nabla^j_{\alpha}] = \left(-d_3 t^{ijk}_{[3]} + \mathfrak{d}^{ij}_{21} a_{11} \right) \nabla^k_\alpha \tag{D10}
\]

\[
[Z^{ij}, \nabla^k_{\alpha}] = f_{22} t^{ijkl}_{[22]} \nabla^l_{\alpha} \tag{D11}
\]

\[
[Z^{ij}, \nabla^k_{\alpha}] = f_{22} t^{ijkl}_{[22]} \nabla^l_{\alpha} \tag{D12}
\]

\[
[Y^i, Y^j] = g_{22} t^{imjn}_{[22]} Z^{mn} \tag{D13}
\]

\[
[Z^{ij}, Y^k] = h_{22} t^{ijkl}_{[22]} Y^l \tag{D14}
\]

\[
[Z^{ij}, Z^{kl}] = k_{222} t^{ijkl}_{[222]} Z^{mn} \tag{D15}
\]

The remaining parameters must satisfy the eighteen equations

\[
d_3 b_{22} = 0, \quad d_3 \mathfrak{b}_{22} = 0, \quad d_3 f_{22} = 0, \quad d_3 h_{22} = 0 \tag{D16}
\]

\[
b_{22} f_{22} = 0, \quad b_{22} h_{22} = 0, \quad b_{22} k_{222} = 0, \quad b_{22} a_{11} \mathfrak{d}^{ij}_{21} = 0 \tag{D17}
\]

\[
\mathfrak{b}_{22} f_{22} = 0, \quad \mathfrak{b}_{22} h_{22} = 0, \quad \mathfrak{b}_{22} k_{222} = 0, \quad \mathfrak{b}_{22} a_{11} d^{ij}_{21} = 0 \tag{D18}
\]

\[
h_{22}(h_{22} - 2 k_{222}) = 0, \quad g_{22}(h_{22} - 2 k_{222}) = 0, \quad f_{22}(f_{22} - 2 k_{222}) = 0 \tag{D19}
\]

\[
d^a_{21}(f_{22} - h_{22}) = 0, \quad \mathfrak{d}^a_{21}(f_{22} - h_{22}) = 0, \quad d^2_3 + 2 N f_{22} g_{22} + N^3 a_{11} d^a_{21} \mathfrak{d}^a_{21} = 0 \tag{D20}
\]

We find seven essentially different subcases (see (52))
Case D1a The parameter $g_{22}$ is free while $h_{22} = k_{222} = b_{22} = \bar{b}_{22} = f_{22} = 0$ and $a_{11}, d_3, d_{21}^a, \bar{d}_{21}^a$, satisfy the condition
\[
a_{11}d_{21}^aN_{21} + \frac{d_2^2}{N_2} = 0. \tag{D21}
\]

Case D1b The parameters $b_{22} \neq 0, d_{21}^a$ and $g_{22}$ are free, $a_{11}$ and $\bar{d}_{21}^a$ are constrained by
\[
\bar{d}_{21}^a a_{11} = 0 \tag{D22}
\]
and the remaining parameters are zero.

Case D1c The parameters $b_{22} \neq 0, b_{22} \neq 0, g_{22}$ are free, $a_{11}, d_{21}^a, \bar{d}_{21}^a$ satisfy the conditions
\[
d_{21}^a a_{11} = 0 \\
\bar{d}_{21}^a a_{11} = 0 \tag{D23}
\]
and the remaining parameters are zero.

Case D2a Here $k_{222} = 1$, the parameters $a_{11}, d_3, d_{21}^a, \bar{d}_{21}^a$ satisfy the condition (D21) and the remaining parameters are zero.

Case D2b All the parameters are zero except $k_{222} = 1, f_{22} = 2$ and $a_{11}$ which is free.

Case D3a All the other parameters are zero except $k_{222} = 1, h_{22} = 2$ and $a_{11}, g_{22}$ which are free.

Case D3b All the parameters are zero except $k_{222} = 1, h_{22} = 2, f_{22} = 2$ and $g_{22}, a_{11}, d_{21}^a, \bar{d}_{21}^a$ satisfy
\[
4g_{22} + N^2a_{11}d_{21}^a\bar{d}_{21}^a = 0.
\]

Class E

Imposing $a_2 = 0, b_{21} = 1, \bar{b}_{21} = 0$, we obtain the chiral superalgebra
\[
\{\nabla_{\alpha}^i, \nabla_{\dot{\alpha}}^j\} = a_{11}\theta^{ij}_{[11]}\nabla_{\alpha \dot{\alpha}}^i \tag{E1}
\]
\[
\{\nabla_{\alpha}^i, \nabla_{\beta}^j\} = N a_{11}c_{11} \theta^{ij}_{[11]} M_{\alpha \beta} + \epsilon_{\alpha \beta} \left( \left( \theta^{ijk}_{[21]} - \theta^{ikj}_{[21]} \right) Y^k + b_{22} t^{ikj}_{[22]} Z^{kl} \right) \tag{E2}
\]
\[
\{\nabla_{\alpha}^i, \bar{\nabla}_{\beta}^j\} = \epsilon_{\alpha \beta} \bar{d}_{22} t^{ikj}_{[22]} Z^{kl} \tag{E3}
\]
\[
\left[\nabla_{\alpha}^i, \bar{\nabla}_{\beta}^j\right] = \epsilon_{\alpha \beta} \left( c_2 t^{ij}_{[2]} + c_{11} \theta^{ij}_{[11]} \right) \nabla_{\beta}^i \tag{E4}
\]
\[
\begin{align*}
[\nabla^i_{\alpha}, \nabla^j_{\beta}] &= 0 \quad (E5) \\
[\nabla^i_{\alpha\alpha}, \nabla^j_{\beta\beta}] &= 0 \quad (E6) \\
[Y^i, \nabla^j_{\alpha\alpha}] &= 0 \quad (E7) \\
[Z^{ij}, \nabla^j_{\alpha\alpha}] &= 0 \quad (E8) \\
[Y^i, \nabla^j_{\alpha}] &= \partial_{i1} c_{11} \nabla^j_{\alpha} \quad (E9) \\
[Y^i, \nabla^j_{\alpha \alpha}] &= \partial_{i1} c_{11} \nabla^j_{\alpha} \quad (E10) \\
[Z^{ij}, \nabla^k_{\alpha}] &= h_{22} t^{ijkl}_{[22]} \nabla^l_{\alpha} \quad (E11) \\
[Z^{ij}, \nabla^k_{\alpha \alpha}] &= 0 \quad (E12) \\
[Y^i, Y^j] &= -\partial_{i1} c_{11} \partial_{22} t^{ijkl}_{[22]} \alpha^{kl} \quad (E13) \\
[Z^{ij}, Y^k] &= h_{22} t^{ijkl}_{[22]} Y^l \quad (E14) \\
[Z^{ij}, Z^{kl}] &= k_{22} t^{ijkl}_{[22]} \alpha^{kl} \quad (E15)
\end{align*}
\]

Here \(a_{11}\) and \(c_{11}\) are free and the remaining parameters satisfy the constraints

\[
\begin{align*}
b_{22} f_{22} &= b_{22} h_{22} = b_{22} k_{222} = 0 \quad (E16) \\
\bar{b}_{22} c_{2} &= \bar{b}_{22} f_{22} = \bar{b}_{22} h_{22} = \bar{b}_{22} k_{222} = 0 \quad (E17) \\
h_{22}(h_{22} - 2k_{222}) &= \bar{f}_{22}(\bar{f}_{22} - 2k_{222}) = c_{2}(\bar{f}_{22} - h_{22}) = 0 \quad (E18)
\end{align*}
\]

We find six essentially different subcases

**Case E1a** The parameters \(h_{22} = k_{222} = f_{22} = \bar{f}_{22} = c_{2} = 0\) and \(a_{11}, b_{22}, \bar{b}_{22}, c_{11}\) are free.

**Case E1b** The parameters \(h_{22} = k_{222} = f_{22} = \bar{f}_{22} = c_{2} = 0\) and \(a_{11}, b_{22}, c_{2}, c_{11}\) are free.

**Case E2a** Here \(k_{222} = 1\), \(a_{11}, c_{11}\) and \(c_{2}\) are free and the remaining parameters are zero.

**Case E2b** Here \(k_{222} = 1\), \(f_{22} = 2\), \(a_{11}\) are free and the remaining parameters are zero.

**Case E3a** Here \(k_{222} = 1\), \(h_{22} = 2\), \(a_{11}, c_{11}\) are free and the remaining parameters are zero.

**Case E3b** Here \(k_{222} = 1\), \(h_{22} = 2\), \(f_{22} = 2\), \(a_{11}, c_{11}, c_{2}\) are free and the remaining parameters are zero.
Class F

Class F has the following basic relations, $a_2 = 0$, $b_{21} = 0$, $\overline{b}_{21} = 0$, which yield the superalgebra

\[
\{\nabla_i^\alpha, \nabla_j^\beta\} = a_{11} \theta_{[11]}^{ij} \nabla_{\alpha} \nabla_{\beta}, \quad (F1)
\]

\[
\{\nabla_i^\alpha, \nabla_j^\beta\} = \varepsilon_{\alpha\beta} b_{22} t_{[22]}^{ijkl} Z^{kl}, \quad (F2)
\]

\[
\{\nabla_i^\alpha, \nabla_j^\beta\} = \varepsilon_{\alpha\beta} \overline{b}_{22} t_{[22]}^{ijkl} Z^{kl}, \quad (F3)
\]

\[
[\nabla_i^\alpha, \nabla_j^\beta] = \varepsilon_{\alpha\beta} \left( c_{21} t_{[2]}^{ij} + c_{11} \theta_{[11]}^{ij} \right) \nabla_j^\beta, \quad (F4)
\]

\[
[\nabla_i^\alpha, \nabla_j^\beta] = \varepsilon_{\alpha\beta} \left( \overline{c}_{21} t_{[2]}^{ij} + \overline{c}_{11} \theta_{[11]}^{ij} \right) \nabla_j^\beta, \quad (F5)
\]

\[
[\nabla_{\alpha\beta}, \nabla_j^\beta] = c_{2} \nabla_2 \left( \varepsilon_{\alpha\beta} M_{\alpha\beta} + \varepsilon_{\alpha\beta} M_{\alpha\beta} \right), \quad (F6)
\]

\[\{Y^i, \nabla_j^\alpha\} = 0 \quad (F7)\]

\[\{Z^{ij}, \nabla_{\alpha\beta}\} = 0 \quad (F8)\]

\[\{Y^i, \nabla_j^\alpha\} = \left( d_{3} t_{[3]}^{ijk} + d_{21} a_{ijk} + d_{21} t_{[21]}^{ijkl} \right) \nabla_j^k \quad (F9)\]

\[\{Y^i, \nabla_j^\alpha\} = \left( \overline{d}_{3} t_{[3]}^{ijk} + \overline{d}_{21} a_{ijk} + \overline{d}_{21} t_{[21]}^{ijkl} \right) \nabla_j^k \quad (F10)\]

\[\{Z^{ij}, \nabla_k^\alpha\} = f_{22} t_{[22]}^{ijkl} \nabla_k^l \quad (F11)\]

\[\{Z^{ij}, \nabla_k^\alpha\} = \overline{f}_{22} t_{[22]}^{ijkl} \nabla_k^l \quad (F12)\]

\[\{Y^i, Y^j\} = g_{22} t_{[22]}^{lmjn} Z^{mn} \quad (F13)\]

\[\{Z^{ij}, Y^k\} = h_{22} t_{[22]}^{ijkl} Y^l \quad (F14)\]

\[\{Z^{ij}, Z^{kl}\} = k_{22} t_{[22]}^{ijkl} Z^{mn} \quad (F15)\]

For $k_{222} = h_{22} = 0$, i.e. case F1, we will limit ourselves to giving the conditions which have to be fulfilled. In the cases F2, F3 where $k_{222} = 1$, we give a more precise discussion. There are many subcases which we have classified as follows

subcase a : $a_{11} \neq 0$

subcase b : $a_{11} = 0$, $f_{22} = 0$, $\overline{f}_{22} = 0$

subcase c : $a_{11} = 0$, $f_{22} = 2$, $\overline{f}_{22} = 0$

subcase d : $a_{11} = 0$, $f_{22} = 2$, $\overline{f}_{22} = 2$. (F16)
With this in mind, we find nine essentially different subcases.

**Case F1** With \( h_{22} = k_{222} = 0 \), which implies \( f_{22} = \bar{f}_{22} = 0 \), the twenty conditions to be fulfilled are

\[
\begin{align*}
    b_{22}d_{21}^p &= 0, \quad b_{22}d_3 = 0 \\
b_{22}d_{21}^p &= 0, \quad b_{22}\bar{d}_3 = 0 \\
a_{11}c_2 &= 0, \quad a_{11}c_{11} = 0 \\
a_{11}\bar{c}_2 &= 0, \quad a_{11}\bar{c}_{11} = 0 \\
a_{11}d_{21}^p &= 0, \quad a_{11}\bar{d}_{21}^p = 0 \\
c_2\bar{c}_2 - N^2c_{11}\bar{c}_{11} &= 0, \quad \bar{b}_{22}c_2 - b_{22}\bar{c}_2 = 0 \\
c_2(\bar{d}_3 - d_3) &= 0, \quad \bar{c}_2(\bar{d}_3 - d_3) = 0 \\
c_2\bar{d}_{21}^a - Nc_{11}\bar{d}_{21}^a &= 0, \quad \bar{c}_2\bar{d}_{21}^a - N\bar{c}_{11}\bar{d}_{21}^a = 0 \\
c_2\bar{d}_{21}^p - Nc_{11}\bar{d}_{21}^p &= 0, \quad \bar{c}_2\bar{d}_{21}^p - N\bar{c}_{11}\bar{d}_{21}^p = 0 \\
d_3^2 - N^2d_{21}^a d_{21}^p &= 0, \quad \bar{d}_3^2 - N^2\bar{d}_{21}^a \bar{d}_{21}^p = 0.
\end{align*}
\]  

(F17)

This leads to a rather long, easy but uninteresting discussion which we will not give.

**Case F2a** Here \( k_{222} = 1 \), \( a_{11} \neq 0 \), \( d_{21}^p, \bar{d}_{21}^p, f_{22} \) and \( \bar{f}_{22} \) satisfy the following conditions.

\[
\begin{align*}
f_{22}(f_{22} - 2) &= 0 \\
\bar{f}_{22}(\bar{f}_{22} - 2) &= 0 \\
f_{22}d_{21}^p &= 0 \\
\bar{f}_{22}\bar{d}_{21}^p &= 0
\end{align*}
\]  

(F18)

and the remaining parameters are zero.

**Case F2b** Here \( k_{222} = 1 \), \( c_2, c_{11}, c_2, c_{11}, d_{21}^a, d_{21}^p, d_3, \bar{d}_{21}, \bar{d}_{21}, \bar{d}_3 \) satisfy the conditions

\[
\begin{align*}
c_2\bar{c}_2 - N^2c_{11}\bar{c}_{11} &= 0, \\
c_2(\bar{d}_3 - d_3) &= 0, \quad \bar{c}_2(\bar{d}_3 - d_3) = 0 \\
c_2\bar{d}_{21}^a - Nc_{11}\bar{d}_{21}^a &= 0, \quad \bar{c}_2\bar{d}_{21}^a - N\bar{c}_{11}\bar{d}_{21}^a = 0 \\
c_2\bar{d}_{21}^p - Nc_{11}\bar{d}_{21}^p &= 0, \quad \bar{c}_2\bar{d}_{21}^p - N\bar{c}_{11}\bar{d}_{21}^p = 0 \\
d_3^2 - N^2d_{21}^a d_{21}^p &= 0, \quad \bar{d}_3^2 - N^2\bar{d}_{21}^a \bar{d}_{21}^p = 0.
\end{align*}
\]  

(F19)

and the remaining parameters are zero.
Case F2c  All the parameters are zero except $k_{222} = 1, f_{22} = 2$ and $c_{11}, \bar{c}_{11}, \bar{d}_3, \bar{d}^b_{21}$ and $\bar{d}^b_{21}$ which satisfy
\[
\begin{align*}
    c_{11} \bar{c}_{11} &= 0, \quad \bar{d}^b_3 - N^2 \bar{d}^a_{21} \bar{d}^b_{21} = 0 \\
    c_{11} \bar{d}^b_{21} &= 0, \quad \bar{c}_{11} \bar{d}^a_{21} = 0 .
\end{align*}
\] (F20)

Case F2d  All the parameters are zero except $k_{222} = 1, f_{22} = \bar{f}_{22} = 2$ and $c_2, c_{11}, \bar{c}_2, \bar{c}_{11}$ which satisfy the condition
\[
c_2 \bar{c}_2 - N^2 c_{11} \bar{c}_{11} = 0 .
\] (F21)

Case F3a  All the parameters are zero except $k_{222} = 1, h_{22} = 2, a_{11} \neq 0$ and $d^a_{21}, \bar{d}^a_{21}, f_{22}, \bar{f}_{22}$ and $g_{22}$ which satisfy the conditions
\[
\begin{align*}
    f_{22}(f_{22} - 2) &= 0, \quad \bar{f}_{22}(\bar{f}_{22} - 2) = 0 \\
    d^a_{21}(f_{22} - 2) &= 0, \quad \bar{d}^a_{21}(\bar{f}_{22} - 2) = 0 \\
    f_{22}g_{22} &= 0, \quad \bar{f}_{22}g_{22} = 0 .
\end{align*}
\] (F22)

Case F3b  All the parameters are zero except for $k_{222} = 1, h_{22} = 2, g_{22}$ and $c_2, c_{11}, \bar{c}_2$, and $\bar{c}_{11}$ which satisfy the condition
\[
c_2 \bar{c}_2 - N^2 c_{11} \bar{c}_{11} = 0 .
\] (F23)

Case F3c  All the parameters are zero except $k_{222} = 1, h_{22} = 2, f_{22} = 2$ and $c_{11}, \bar{c}_{11}, d^a_{21}$ and $d^b_{21}$ which satisfy the conditions
\[
\begin{align*}
    c_{11} \bar{c}_{11} &= 0, \quad c_{11} d^a_{21} = 0, \quad \bar{c}_{11} d^b_{21} = 0 \\
\end{align*}
\] (F24)
and the dependent parameter
\[
g_{22} = \frac{N}{4} d^a_{21} d^b_{21} .
\] (F25)

Case F3d  All the parameters are zero except for $k_{222} = 1, h_{22} = 2, f_{22} = \bar{f}_{22} = 2$ and $c_{11}, c_2, \bar{c}_{11}, \bar{d}_{21}, d^a_{21}, d^b_{21}, \bar{d}^a_{21}$ and $\bar{d}^b_{21}$ which satisfy the conditions
\[
\begin{align*}
    c_2 \bar{d}^a_{21} - N c_{11} d^a_{21} &= 0, \quad \bar{c}_2 \bar{d}^a_{21} - N \bar{c}_{11} d^b_{21} = 0 \\
    c_2 \bar{d}^b_{21} - N c_{11} \bar{d}^b_{21} &= 0, \quad \bar{c}_2 \bar{d}^b_{21} - N \bar{c}_{11} \bar{d}^a_{21} = 0 \\
    c_2 \bar{c}_2 - N^2 c_{11} \bar{c}_{11} &= 0, \quad d^a_{21} d^b_{21} - \bar{d}^a_{21} \bar{d}^b_{21} = 0
\end{align*}
\] (F26)
and the dependent parameter
\[
g_{22} = \frac{N}{4} d^a_{21} d^b_{21} .
\] (F27)
