INTRODUCTION

The word poison originates from the Latin word potionem which means deadly drink / deadly draught. The Herald of modern Toxicology, Paracelsus, once said that everything is poison and only the dose plays a pivotal role.¹ Poisoning is the fourth commonest cause of death in India and five to six persons per lakh of the population die due to acute poisoning every year.² In India, poisoning related hospitalizations have been almost up to 17%, and contribute to health-related complications and death.³ Annually 0.3 million people die due to various poisoning agents as per World Health Organization (WHO) estimates. Acute pesticide poisoning with agents like aluminium phosphide and organophosphate poisonings is very common in North India as the majority of people are farmers.⁴ The nature of poisoning varies from country to country and also between various regions within a country depending upon sociodemographic factors, diversity of culture and different social beliefs. Majority of Indian population is agriculture-based residing in rural areas so have easy excess to pesticides contributing significantly to accidental as well as intentional poisoning and as a result, deliberate self-harm has become a public health problem.⁵ The study was conducted to generate a sociodemographic profile of acute poisoning cases in our region which in turn will help in planning rational use of available resources for the prevention and management of poisoning cases.
MATERIALS AND METHODS

The study was undertaken on 145 patients admitted in Medicine wards with acute poisoning in the department of Medicine at SLBSGMC, Mandi at ner chowk, Himachal Pradesh. 66 (45.52%) were male and 79 (54.48%) females. Percentage of age-wise distribution is shown in figure1. The present study was planned under suitably designed data regarding demographic details shown in table 1.

Table 1: The present study was planned under the following heading

| Age-wise distribution | Place of consumption |
|-----------------------|----------------------|
| Sex wise distribution | Mode of poisoning    |
| Educational status    | Time of poisoning    |
| Psychiatric disorder  | Who brought the patient to Hospital |
| History of substance abuse | Marital status |
| Causative agent       | Occupation           |

RESULTS

The maximum number of acute poisoning cases were reported in the age group of 18-30 years 66 (46%), 59 (41%) in the age group of 31-45 years, 13 (9%) in 46-60 years and 7 (4%) patients were above the age of 60 years (Table 2).

Educational status was also analyzed. 64 (44%) cases of poisoning were seen in those having high school level of education, 62 (43%) in intermediate to graduates, 10 (7%) illiterates, 6 (4%) in primary school pass out, and 03 (2%) in professionals B.E (2), MBBS (1).

Place of consumption was home in 129 (90%) and outside in 16 (10%) (Figure 2).

In 54 (37%) patients the poisoning was caused by a varied class of agents ranging from a variety of antifungal herbicides, datura poisoning, Iron poisoning, Mushroom poisoning, Parquet, antipsychotic, sedative agents and various drug overdoses.

Table 3: A structural performa designed regarding the demographic details-

| Categories                     | Male (n) | Female (n) | No of cases (n %) |
|--------------------------------|----------|------------|-------------------|
| Causative Agent                |          |            |                   |
| Organophosphorus               | 09       | 12         | 21 (15%)          |
| Aluminium Phosphide            | 07       | 12         | 19 (12%)          |
| Organochlorine                 | 04       | 06         | 10 (7%)           |
| Zinc phosphide                 | 15       | 05         | 20 (14%)          |
| Parquet                        | 02       | 06         | 08 (5%)           |
| Combined Organophosphorus      | 08       | 04         | 12                |
| Plus organochlorine            | 00       | 01         | 01                |
| Combined organophosphorus plus others. | 25       | 26         | 54 (37%)          |
Table 3: (Continued)

| Categories             | Male (n) | Female (n) | No of cases (n %) |
|------------------------|----------|------------|-------------------|
| Educational Status     |          |            |                   |
| Illiterate             | 06       | 04         | 10 (7%)           |
| Primary                | 02       | 04         | 06 (4%)           |
| High School            | 28       | 36         | 64 (44%)          |
| n to Graduate          | 31       | 31         | 62 (43%)          |
| Professional           | 02       | 01         | 03 (2%)           |
| Age in years           |          |            |                   |
| 18-30 years            | 25 (38%) | 41 (52%)   | 66 (46%)          |
| 31-45 years            | 27 (41%) | 32 (41%)   | 59 (41%)          |
| 46-60 years            | 09 (13%) | 04 (5%)    | 13 (9%)           |
| >60 years              | 05 (8%)  | 02 (2%)    | 7 (4%)            |
| Total                  | 66 (45.52%) | 79 (54.48%) | 145 (100%)      |
| Mode of Poisoning      |          |            |                   |
| Accidental             | 21       | 13         | 34 (23%)          |
| Suicidal               | 46       | 64         | 110 (76%)         |
| Homicidal              | 01       | 00         | 01 (1%)           |
| History of Substance Abuse |          |            |                   |

| Misc.                  |          |            |                   |
| None                   | 08       | 01         | 09 (6%)           |
| None                   | 04       | 76         | 80 (55%)          |
| Occupation             |          |            |                   |
| Employed               | 43       | 07         | 50 (34%)          |
| Unemployed             | 29       | 66         | 95 (66%)          |

In 21 (15%) patients poisoning was caused by organophosphorus, 20 (14%) by Zinc phosphide, 19 (12%) by aluminium phosphate. Combined organophosphorus and organochlorine poisoning was found in 12 (8%) while 8 (5%) had parquat poisoning. (Table 3). 129 (90%) took poison at home. 110 (76%) patients took poison with suicidal intent, in 34 (23%) it was accidental intake and only in one (0.75%) it was homicidal. (Table 3). 91(63%) patients were brought in the hospital by relatives, 19(13%) by parents, 13(9%) by their spouse, 12(8%) by in-laws and 7(5%) by friends (Table 3). Incidence of poisoning was more in married persons 109 (75%), 34(23%) were unmarried and 2(1.45%) were widows.

Alcohol was the most frequent substance of abuse 56 (39%). This was especially true for males as 54 out of 56 were males, other substances abused were chitta (4) bhang (opium) (3) and one case of morphine. 80 (55%) patients had no history of substance abuse mostly females 76 out of 80.

Psychiatric illness was seen in significant numbers of patients, 38(26%) patients had alcohol dependence, behaviour disorders were 33(23%), depressive disorder 22(15%), adjustment disorder in 16(11%), anxiety and bipolar disorder were 2(1.5%). Out of 79 females in this study 57(72%) had some form of psychiatric disorder. Most of the patients in our study were unemployed 95 (66%) and mostly these were housewives 66 (63%) (Figure 3).

**DISCUSSION**

In the developed world rate of mortality from poisoning is testified to be 1% to 2% which is comparatively less as compared to developing countries like India where more than 50,000 deaths occur due to toxic exposure (Table 4). According to the national survey on drug use and health, 18-25 years of age had higher percentages of suicidal thoughts and attempts as compared to middle-aged adults (45 to 64).

The present study also agrees with the national survey and indicate that 18-30 years old patients had higher suicidal thoughts, attempts and increased incidence of poisoning. Reddy et al reported the majority of poisoning cases in the age group for up to 30 years. Prajapati et al and Maheswari et al have found the majority of cases were in young people (age group of 21-30 years). This is similar to the findings of Singh and Unni Krishnan in Mangalore, south India, Sarkar et al in Bangladesh and Hovda et al in Norway that acute poisonings were more common in young ages (20-40 years). (Table 4).

Acute poisoning was higher in females (54.48%) than males (45.52%) in our study which is similar to Reddy et al.
Heyerdahl et al.13 and contrary to most studies in India Ramesh et al.14 and Srinivasa et al.15 Our state is predominantly a rural state where girls get married at a younger age, most of the cases their husbands are working outside in other states due to paucity of jobs in our state and hence increases family pressure, pressure from in-laws, many time forced marriages, infidelity on part of spouse leading to emotional instability, depression, physical abuse. These all culminate into the increased incidence of poisoning in our females.

90% of patients in our study consumed poison at home and in 76% it was suicidal intent. A similar observation was reported by Maharani as et al.17 and this could be because of the pressure of studies, settlement issues, lack of emotionally supportive network, divorce and insufficiency to adapt to some quick circumstances.18

### Table 4: Percentage of suicidal thoughts age 18 – 30 years.

| Author                  | Year | Percentage |
|-------------------------|------|------------|
| National Survey         | 2014 | Higher     |
| Reddy et al             | 2018 | Higher%    |
| Prajapati et al         | 2013 | Higher%    |
| Maheswari et al         | 2016 | Higher%    |
| Singh B Unnikrishnan B. | 2006 | Higher%    |
| Sarkar et al            | 2013 | Higher%    |
| Hovda et al             | 2008 | Higher%    |

### CONCLUSION

The study agrees with the national survey in that the commonest age group involved is 18-30 years, one of the most productive years of life and is more common in females. The social and peer pressure, marital and family discords, drug abuse, unemployment and psychiatric disorders are the causes behind this increased risk. More stress on moral education, counselling of youngsters, married couples, emphasis on treatment and counselling for psychiatric disorder will go a long way in reducing the sufferings of society. Over the counter sale of toxic agents and pharmacological drugs should be strongly regulated.

### ACKNOWLEDGEMENT

The author acknowledges and thanks to all the doctors and non-medical staff of ward, Department of Medicine, SLBS Govt. Medical College & Hospital for their cooperation. Special thanks to Dr Pankaj Soni and Bharti Sharma for statistical analysis and manuscript typing.
