Abstract

**Background:** Knowledge of tuberculosis is very important for the patients. **Objective:** This study was aimed to assess and explore the knowledge of TB patients regarding their diseases in Quetta, Pakistan. **Methodology:** This questionnaire based, cross sectional analysis was conducted in Fatima Jinnah Chest Hospital, Quetta with in all TB patients. Knowledge was assessed by using a pre-validated self-administered questionnaire containing 22 disease related questions. Convenience sampling technique was used for data collection. Descriptive analysis was used to demonstrate the characteristics of the study population. **Result:** Mean age of respondents was 40.99±18.10. Study was dominated by 168 (60.00%) of females. Two hundred (71.40%) were married. One hundred sixteen (41.40%) had no any education. One hundred sixty-eight (60.00%) were Pashtun. One hundred thirty-two (47.10%) having income less than 10000 PKR and ranges between 10000 to 18000 PKR respectively. One hundred fifty-six (55.70%) were having rural residency. One hundred fifty-six (58.10%) having no any co-morbidity. Mean score of knowledge was 11.23±3.616. **Conclusion:** Knowledge is a key factor in understanding any particular disease. If the level of knowledge is low in some or all parts of the disease, it will actually affect the patient. It can be concluded that there is a need to raise awareness of TB symptoms, mode of transmission, prevention, diagnosis and treatment of the disease through health education.

**Keywords:** Tuberculosis; knowledge; disease state knowledge

Introduction

Tuberculosis is the leading infectious diseases worldwide and is responsible for the largest number of deaths in the world. Tuberculosis remains main public health concern among developed and developing countries even though drugs for prevention of TB have been available for past 6 decades.

Tuberculosis (TB) is a fatal infectious disease caused by several species of Mycobacteria, primarily Mycobacterium tuberculosis. In 2014 statistics shown that, about 9.6 million people diagnosed with TB and 1.5 million expired from TB. Over 95.0% of TB deaths happen in low- and middle-income countries, and it is among the top 5 causes of death for women aged 15 to 44 years. According to World Health Organization Global tuberculosis report 2015 out of 185 million population of Pakistan, the mortality rate is estimated forty-eight thousand having TB; however, prevalence of TB + HIV found six hundred and thirty thousand.

Tuberculosis (TB), one of the oldest noted human disease, is still one of the major cause of deaths among the infectious diseases, regardless of the worldwide use of vaccines and several antibiotics. Since two million people die each year from this disease. TB has many indexes, affecting bone, the central nervous system, and many other organ systems. TB is contagious disease triggered by the tubercle bacillus, Mycobacterium tuberculosis and characterized pathologically by inflammatory infiltration, formation of tubercles, caseation, necrosis, abscesses, fibrosis, and calcification. It commonly disturbs the respiratory system, but other parts of the body such as the gastrointestinal and genitourinary tracts, bones, joints, nervous system, lymph nodes, and skin may also become infected.

Studies have been conducted on assessment of knowledge regarding TB. Several studies have reported the lack of knowledge worldwide. While some studies have reported the lack of knowledge of TB in Pakistan. Despite TB being an issue of global concern, no studies on knowledge of TB patients regarding their disease have been reported in Quetta, Pakistan. Therefore, this study aimed to explore the knowledge of TB patients regarding their disease in Quetta.

Methodology

Study Design, Settings and Sampling: A questionnaire based, cross-sectional analysis was conducted. Registered patients from Fatima Jinnah Chest Hospital, also called TB Sanatorium Quetta, Pakistan were included for this study. Fatima Jinnah chest hospital is major hospital for the treatment of TB all over Balochistan and patients from every district of Baluchistan came here for treatment of TB. According to registered patient data 352 questionnaires were distributed among patients of whom 280 returned the questionnaire.

Ethical Consideration: This study was performed according to National Bioethics Committee Pakistan’s guidelines. Written consent was taken from patients prior to data collection. Patients were ensured about the confidentiality of their answers and their right to leave the survey at any time.

Study Tool: The study tool was designed by experts of Department of Pharmacy Practice, Faculty of Pharmacy, University of Balochistan, Quetta, with help previous articles and WHO (World Health Organization) guideline for KAP studies for TB. The final questionnaire comprised of four main sections, the first section is Demographics, second section comprised of Twenty-Two questions specifically to assess the knowledge regarding the disease TB, third section is Comorbidities and fourth is Source of information. The knowledge question consists of domains i.e. General description, Etiology, Sign and Symptoms, Risk factors, Diagnosis and Prevention of TB. The dichotomous type of questionnaire was made with ‘Yes’ ‘No’ and ‘Don’t know’ options.

Scoring Method: The response was recorded as ‘Yes’ ‘No’ and ‘Don’t know’. Each correct answer carried 1 mark whereas wrong or ‘don’t know’ carried 0 mark. This gave a total score range of 0 to 22. A cut-off level of ≤11 was considered as poor knowledge while >11 was regarded as good knowledge.

Statistical Analysis: Descriptive analysis of patient’s demographic information was performed. Categorical variables were measured as frequency and percentages while continuous variables were expressed as mean with standard deviation. Inferential statistics (Mann–Whitney U test and Kruskal Wallis tests, p < 0.05) were used to assess the significance among study variables.

Results

Demographic characteristics: The demographic characteristics of respondents were displayed in Table 1. It describes the demographic information of the study participants. Mean age of respondents was 40.99 ± 18.10. Study was dominated by 168 (60.00%) of females. Two hundred (71.40%) were married. One hundred sixteen (41.40%) had no any...
education. One hundred sixty-eight (60.00%) were Pashtun. One hundred thirty-two (47.10%) had income less than 10000 PKR and ranges between 10000 to 18000 PKR respectively. One hundred fifty-six (55.70%) were having rural residency. One hundred fifty-six (58.10%) had no any co-morbidity.

**Association of Demographics and Knowledge Score:** Inferential statistics, i.e. Mann-Whitney test and Kruskal Wallis test were applied to compare scores of knowledge with various demographic variables. Association of demographic characteristics and mean knowledge score is presented in Table 1. Mann-Whitney test ($p < 0.05$) and Kruskal Wallis test ($p < 0.05$). By taking $p < 0.05$ as statistically significant value. No statistically significant difference in scores was observed among demographic variables.

**Table 1: Demographic Characteristic of the Respondents (n= 280)**

| Category                  | Frequency | Percent | Knowledge Score  | P value |
|---------------------------|-----------|---------|------------------|---------|
|                           |           |         | (Mean ± SD)      |         |
| **Age Group**             |           |         |                  |         |
| 12 to 21 Years            | 40        | 14.3    | 10.2±2.898       | 0.154   |
| 22 to 31 Years            | 68        | 24.3    | 12.3±4.429       |         |
| 32 to 41 Years            | 40        | 14.3    | 9.2±3.676        |         |
| 42 to 51 Years            | 60        | 21.4    | 10.7±3.132       |         |
| 52 to 61 Years            | 28        | 10.0    | 11.4±3.409       |         |
| ≥62 Years                 | 44        | 15.7    | 12.9±2.737       |         |
| **Gender**                |           |         |                  |         |
| Male                      | 112       | 40.0    | 11.4±3.773       | 0.729   |
| Female                    | 168       | 60.0    | 11.1±3.552       |         |
| **Marital status**        |           |         |                  |         |
| Married                   | 200       | 71.4    | 11.18±1.888      | 0.334   |
| Unmarried                 | 80        | 28.6    | 12.00±6.298      |         |
| **Education Level**       |           |         |                  |         |
| Matric                    | 44        | 15.70   | 11.57(3.749)     | 0.668   |
| Intermediate              | 28        | 10.00   | 10.55(3.203)     |         |
| Masters                   | 4         | 1.400   | 11.00(3.464)     |         |
| Religious education only  | 88        | 31.40   | 14.00(00000)     |         |
| None                      | 116       | 41.40   | 10.50(5.260)     |         |
| **Income**                |           |         |                  |         |
| <10,000                   | 132       | 47.10   | 4.55(3.001)      | 0.130   |
| 10,000 to 18,000          | 132       | 47.10   | 11.12(3.830)     |         |
| 18,001 to 25,000          | 8         | 2.900   | 13.50(2.121)     |         |
| More than 25,000          | 4         | 1.400   | 20.00(0000)      |         |
| No income                 | 4         | 1.400   | 4.00(00000)      |         |
| **Locality**              |           |         |                  |         |
| Urban                     | 124       | 44.30   | 11.68(3.637)     | 0.243   |
| Rural                     | 156       | 55.70   | 10.87(3.607)     |         |

**Assessment of knowledge of Tuberculosis:** Table 2 describes the present level of knowledge about Tuberculosis. Each response was recorded as ‘Yes’ ‘No’ and ‘Don’t know’. Each correct answer carried 1 mark whereas ‘No’ or ‘don’t know’ carried 0 mark. This gave a total score range of 0-22. A cut-off level of $<11$ was considered as poor knowledge while $>11$ was regarded as good knowledge. Mean of total score of knowledge was 11.09 $\pm$ 3.49. Out of 280 respondents, 144 (51.4%) had poor knowledge and 136(48.6%) had good knowledge about Tuberculosis.

**Table 2: Responses related to knowledge of Tuberculosis**

| Questions                      | Yes   | No  |
|--------------------------------|-------|-----|
| Have you heard about disease name TB? | 92.1% | 2.90% |
| TB primarily affects lungs?     | 68.6% | 31.4% |
### Sources of Information:

The source of information regarding TB knowledge was presented in Table 3, it showed that dominant source of information (n=220, 78.5%) was health workers through which patients seek information followed by radio as source of TB information among patients (n=124, 44.2%).

**Table 3: Sources of Information**

| Source of Information            | Frequency | Percent |
|----------------------------------|-----------|---------|
| Newspaper                        | 28        | 10.0    |
| Radio                            | 124       | 44.2    |
| TV                               | 24        | 8.6     |
| Health workers                   | 220       | 78.5    |
| Family & neighbors               | 24        | 8.6     |
| Brochures pictures & printed material | 52    | 18.6    |
| Religious leaders                | 12        | 4.30    |

### Discussion

The present study revealed that the TB patients have poor knowledge regarding their disease. The lack of knowledge was analyzed after determining various components for assessing the knowledge; this is supported by the study which also states the same situation conducted in Malaysia\(^{13}\). Contrary to the findings of other study, which showed that the knowledge about tuberculosis among TB patients was quite high\(^{17}\).

Significance of demographics was analyzed to estimate knowledge of TB and result showed that there is no significant effect of demographics on study, these demographics includes various variables like age group, gender, ethnicity, locality, marital status, education and income. Contrary to the findings of the study conducted by Agboatwalla et al\(^{14}\) in Turkey, which shows significant effect of majority of demographics on their study.

This study showed that there was very little information present from the TV reason is this majority of patients were from rural area so they are not having a TV this finding is supported by study conducted in Ethiopia\(^{11}\). The findings of this study show that main source of information was brochures, posters and other printed materials and it is supported by the study conducted in Pakistan which have the similar findings\(^{14}\).
The cause of the disease is main concern while assessing the knowledge of the disease among patients and knowing the cause can help in decreasing the occurrence of disease, among these causes the lack of knowledge was seen in TB patients. These findings are consistent with the study conducted to assess the knowledge about tuberculosis among newly diagnosed TB patients in India. There is better understanding of symptoms of TB in our study subjects so this can be helpful in controlling TB occurrence and these findings also consistent with study conducted in India, where maximum patients know that cough is the more frequent symptom of TB. The findings of this study in terms of locality showed that patients from rural area have good knowledge of TB and this is supported by findings similar to study conducted in Lima Peru.

In this study, it was found that knowledge about the BCG vaccination as a preventive measure was very limited and few patients know that there is vaccination available for TB as preventive measure and it is supported by the study conducted in Pakistan. So lack of knowledge about prevention can cause effect on prevalence rate of TB.

Disease condition was assessed either it is curable disease this was in agreement with a study conducted in Pakistan. After that another parameter about knowledge of treatment duration was analyzed as shown in results so it also shows lack of knowledge among patients and standard treatment was limited so there may be the chances of treatment relapse and MDR TB, this is consistent with the previous studies conducted in Pakistan.

Appropriate knowledge is of prime importance for control and prevention of many diseases and tuberculosis. This study concludes that knowledge about tuberculosis among the patients registered in Fatimah Jinnah hospital who visited hospital is low and highlights the importance for planning designing and applying appropriate programs and interventions to propagate the knowledge and information about tuberculosis in the general population. There is need of more studies and research to assess knowledge and understanding about tuberculosis at higher and community basis. This should only be possible with incorporated efforts by government and non-governmental health organizations, media along with active community participation. In this study, it was found that knowledge about the diagnosis of disease is far better as compared to the knowledge of the cause & mode of transmission of TB. The reason behind this may be that this is the only knowledge which is provided by health care professionals at the time of diagnosis. If some more attention is given to other issues, including the knowledge regarding cause, mode of transmission may increase which might be helpful in the control of tuberculosis among general population. The results of this study should be interpreted with caution as the study was conducted among patient and not ideally representing the general population.

**Conclusion**

Knowledge is a key factor in understanding any particular disease. If the level of knowledge is low in some or all parts of the disease, it will actually affect the patient. It can be concluded that there is a need to raise awareness of TB symptoms, mode of transmission, prevention, diagnosis and treatment of the disease through health education. In this study majority of study subjects had poor knowledge about cause of tuberculosis, its mode of transmission and duration of treatment while knowledge regarding the major symptoms of TB was found better among most of the respondents. It is concluded that as knowledge is a key factor for the prevention and control of TB, it is obvious to plan and apply appropriate health education programs, seminars and interventions regardless to the level of education of population to propagate the knowledge and information about causes, transmission and duration of treatment of tuberculosis in the general population and TB patients to coup with further disease progression in Pakistan.

It is recommended that knowledge is prime factor that affects TB, and proper health education, awareness programs within community should be held to clarify the concepts of patients about cause of disease if they know basic underlying cause there will be more improvement in controlling TB. Another parameter was transmission of disease that also need more efforts to aware patients and population if they know about transmission so there would be less chances of disease propagation and ultimately there would be less chances of disease progression.
