Abstract

Background: Board of Trustees (BOTs) in Iranian medical universities has been considered as one of the most important structural and managerial changes to create a revolution in decision-making and accountability. This study aimed to explore challenges facing BOTs in governing Medical Universities (MUs).

Methods: In this qualitative study, 27 semi-structured interviews were conducted with current and former members of BOTs, chancellors of universities, BOTs’ secretaries, and staff in the Ministry of Health and Medical Education in 2017. These participants were selected using a purposive and snowball sampling method. Data were analyzed by framework analysis and using Atlas-Ti software.

Results: Five key themes were identified, including 1) infrastructure (problems in BOT laws and membership requirement), 2) planning and decision-making (evidence-based decision making and planning and meeting), 3) organizing (ambiguity in positions and lack of necessary administrative structure), 4) performance evaluation (self-reporting, lack of time allocation, lack of evaluation criteria and lack of required structure for evaluation), 5) independence and influence on performance (dependency on the Ministry of Health and financial independence).

Conclusion: Due to obsolete laws, it seems that the structural and executive reform of BOTs is essential. The issues of university autonomy and empowerment of the boards’ members should particularly be considered in such reforms. However, it appears that more delegation and empowering the position of the boards could be effective strategies in governance medical universities.

Keywords: Governing board, Trustees, Qualitative study, Iran

Introduction

Today, universities are undergoing more decisive changes than other fields. Universities have a critical role in supporting and maintaining economic growth, but they have been facing unprecedented pressure from governments and the public to improve their efficiency, quality and reduce costs (1). One of the consequences of such pres-
Board of trustees’ in medical universities

Assures is managerial changes with the purpose of coordinat-
ing university activities with the needs of society, further
efficiency of activities as well as earning more income. In
this field, the sustainable organizational response will de-
pend crucially on governance, leadership, and management
functions (2). Several models have been created in different
parts of the world for university governance, each of which
has its own strengths and weaknesses (3). The most im-
portant of such models are: 1) University governance by
academic staff, 2) Corporate governance, 3) Trustees

governance, 4) Stakeholder governance, 5) Amalgam
model of governance (3). Among these models for univer-
sity governance, there has been much more attention to the
role of the governing board. The governing board, which is
the most important kind of boards, has been identified as
the decision and policy-making group that has a position at
the top of an organizational structure. The board has the
highest organizational authority and is accountable for or-
ganizational activities and outcomes as well (4).

In the context of Iran, the Ministry of Health and Med-
ical Education (MOHME) is responsible for public health,
treatment, and medical education (5). Medical education in Iran is highly centralized. However, despite a

growing tendency towards delegation and application of
educational policies, the regulations and rules are still
centrally dictated, and universities have had very limited
authority to modify this condition (5). In this regard, par-
cular attention has been rendered to the empowerment of
the university board of trustees (BOTs) as one of such
structural and managerial changes to create devolution in
decision-making and accountability. However, many be-
lieve that a few years after the ratification of the BOTs’
Act, the responsibilities of BOTs are not still completely
specified and universities are being governed based on
previous regulations (5). Since there is little literature re-
garding the BOTs’ challenges in governing medical un-
iversities in Iran, this study aimed to determine these chal-
enges from the experts’ viewpoints.

Methods

Research design

This qualitative study was carried out in 2017, in which
twenty-seven persons were selected using purposive snow-
ball sampling. The selection criteria were as followed: be-
ing a BOTs member for at least 4 years, being a university
manager for at least 4 years, participating in BOTs meet-
ings as a MOHME expert for at least 2 years, or being
BOTs’ secretary in medical universities for at least 4 years.

Data collection

The participants were contacted by telephone for the in-
terview, and then a sheet containing the purpose of the pro-
ject, introduction of the researcher, and a request for the ap-
pointment was sent to them. It was tried to carry out the
interview with the participants in their office or at the possi-
bale time around the BOTs meetings so that they feel more
comfortable. Twenty-seven face-to-face interviews as well
as five complementary interviews, were conducted by tele-
phone. All interviews were recorded and transcribed. The
average interview time was 45 to 75 minutes. The inter-
views were performed by one of the authors (H. E.). The
questions were designed in such a way that they could in-
quire about the attitudes and beliefs of interviewees about
the subject. First, four in-depth interviews were conducted
in order to obtain a better understanding of the subject and
to identify the issues that should be considered during the
semi-structured interviews so that accordingly, an appro-
priate set of questions can be developed for these inter-
views.

Data analysis

The Framework Analysis method was used to analyze
data that consisted of five steps of familiarization, identify-
ing a thematic framework, indexing, charting as well as
mapping and interpretation. This method of analysis is
more used for analyzing qualitative data in policy-making
studies. During the familiarization step, a form including
information related to subjects and a content summary of
each interview was developed. In order to develop the ini-
tial thematic guide form, frequent meetings were held be-
tween researchers and they discussed the topic. Then, this
thematic framework was examined through frequent anal-
ysis of each of the interviews (Familiarization step).

One of the authors (H.E.) coded each interview and ex-
tracted a list of these codes from the interviews, along with
their relation to the thematic framework. In this step, one or
two codes were assigned to each part of the interviews con-
taining related information. Then, these codes were studied
and modified if deemed necessary through meetings with
other researchers. This process was repeated several times
for each of the interviews. Subsequently, tables were drawn
up in order to compare the views of interviewees about each
component of the thematic model and to specify the rela-
tionship between each component of the model with its sub-
set. Where necessary, the original interviews were also re-
ferred for a better understanding of participants’ state-
ments, and the important contents were added to it. The in-
terpretation of each of the components of the thematic
model was performed within the same process as the index-
ing step. Atlas-Ti software was used in all mentioned steps.
The Thematic Framework was frequently revised in the
analysis process. The Initial Framework included five
themes that remained almost unchanged; however, the sub-
groups of each of these thematic components were funda-
mentally changed during this process. Researchers pro-
vided data from field notes and memos, and in the analysis
process, the authors repeatedly discussed the process of
analysis. Member checking was performed during data col-
lection, and then the researchers’ interpretations were veri-
fied by the participants. Interviews and the analysis process
were audited by the first author and then reviewed by the
second and third author, making changes wherever needed.
The prolonged engagement of researchers in the process of
study strengthens the trustworthiness of the results. Fur-
thermore, to facilitate transferability, the study process was
reported in detail and representative quotations from the
transcript were provided.

Ethical considerations: In this study, initial verbal con-
sent was obtained from the interviewees. Participants

http://mjiri.iums.ac.ir
Med J Islam Repub Iran. 2021 (17 Apr); 35:50.
were informed that they could decline participation at any time during the study. They were informed that their participation was confidential and voluntary, and the information used in the article would be anonymous.

Results
Participants were current and former members of BOTs of medical universities in Iran (17 persons), current and former chancellors of universities (four persons), secretaries of BOTs (four persons), and staff of the Ministry of Health who work in the related area of BOTs’ affairs (two persons), respectively. The mean age of these participants was (44.8 ±7.34) and regarding their educational level, thirteen participants were physicians, eight participants were Ph.D. and finally, six participants were MSc and BSc. The identified themes and sub-themes have been separately explained.

Theme I: Infrastructures
Laws: The current BOTs law of Iran universities has considered high and increasing authorities for boards of trustees. The problems associated with the current regulations from the perspective of the participants of this research include contradiction of laws, lack of transparency of laws, and lack of comprehensive laws.

Contradiction in Laws: Despite the stipulation of laws concerning BOTs’ authority to make decisions independently and exempt from observing the common rules of the country, some decisions cannot be implemented due to conflict with other laws of the country. Two different reasons can be enumerated for this issue: 1) implementation of some decisions require the collaboration of organizations that are not aware of exemption of universities from the common laws of the country, 2) legislation of laws by Parliament that limits the given authorities to BOTs. One of the participants of the research explains this issue as follows:

“For instance, Board of Trustees approves purchase of a car from the income of university, but the Department of Finance states that this [Act] cannot be accepted and applied pending the approval of police” (P5).

Lack of Transparency of Laws: Lack of transparency of BOTs’ authority has caused more conservative members or members who do not care much for the problem of universities to use it as an excuse for not entering the approval of many concerning plans. For example, one of the participants has stated:

“For example, it is stipulated in the BOTs laws that: ‘…decision on how to manage service units (hospitals, health departments, etc.)…’ what does decision on how to manage means?” (P13)

Lack of Comprehensive Law: Due to the dispersion of regulations that exist on the authority of BOTs and lack of transparency in some of them, the authorities of BOTs in various rules should be amassed in a comprehensive law and then be approved by Parliament.

Membership: In this section, three important concepts are highlighted, including membership criteria, composition, and the number of members as well as empowerment of members.

Membership Criteria: From the participants’ perspective, the criteria that should be considered in selecting the members of BOTs include:

• Allocating time to university affairs and having concern about the university
• Being indigenous
• Having managerial as well as administrative knowledge and experience
• Having political and social influence
• Having novel and diverse perspectives

Composition and Number of Members: The participants believe that the number of members is sufficient at present, and the number of members can be added if deemed necessary. The promotion of technical skills of BOTs, particularly in financial and managerial areas, should be taken into consideration. In addition, the criterion of social and political influence is too much considered in the selection of BOTs members, while politically and socially influential individuals, due to busy responsibilities, cannot be seriously involved in university issues and the university is not usually among the major personal or professional concerns for these members. Additionally, medical universities are responsible to provide health services in related provinces. Therefore, a major part of their human resources is health service providers who have currently no representative in BOTs.

“As long as the medical universities are in charge of providing health services, the health care workers should have representative in BOTs, as faculty members have” (P22).

Empowerment of Members: Many participants believed that scores of BOTs members are not familiar with their duties and at present, there is no specific arrangement to exchange experiences of BOTs members of different universities.

“The members of BOTs must be trained about their duties and should be unanimous in respect to their tasks” (P12).

Theme II: Planning
Long-term Planning: Little attention to country’s long-term programs and lack of a strategic plan approved by the BOTs are among the most important problems stipulated by research participants. This problem has led to the fact that the decision-making of BOTs is not directed toward a clear objective, and furthermore there is no framework for evaluating the performance of university by BOTs. In this regard, one of the participants declares that:

“Long-term plans of university are not presented to BOTs for approval. If we have these plans, we would arrange the agendas within the framework of such long-term plans and perform evaluations based on them” (P6).

Evidence-based Decision-making: In this section, the most important part of the participants’ perspective includes screening system of agenda, existence of expert committees, and passiveness of meetings.

Screening System of Agenda: The features of "lack of a
Board of trustees’ in medical universities

specific screening system of agenda” included the followings: delay in sending the documentations of meetings to members prior to holding sessions, not inviting members to participate in meetings in order to study the agenda before holding BOTs meeting, high volume of documentations submitted to the BOTs and also, lack of time to review the agenda and unfamiliarity of members to the issues mentioned in documents. For example, one of the members explained this problem as follows:

“The members of BOTs should know that what the origin of discussed proposal at the meeting is. Many of such proposals have not originated from BOTs which means that they have never been discussed before in BOTs meetings” (P18).

Presence of Expert Committees: Currently, there are no permanent expert committees in BOTs. To compensate for this shortcoming, some universities, benefiting from the human resources of other parts of universities, have formed ad hoc committees. These ad hoc committees are responsible for various actions such as developing and refining the proposals of different departments, which are scheduled to be discussed in BOTs. One of the participants in this study explains the issue as follows:

“One of the weaknesses is lack of expertise team in BOTs. Given that we do not enjoy such a team, the experts from other fields should do this task; however, this relationship is not defined as well” (P4).

Passiveness of Meetings: The findings of this section of the study contain two facts. First, the members of BOTs are always waiting for university president or Ministry of Health for holding the sessions (passive action to attend meetings) and also in respect to the agenda, the university president and board of managers define the needed issues to discuss in BOTs meeting (passive action about the agenda).

Based on the needs arising from deputees, some discussions are posed at BOTs. These deputees usually bring such issues before the president of the university and decide whether it can be discussed at BOTs based on university visions. It means that the members of BOTs act passively rather than proposing the issues themselves.

Planning of Meetings: The participants in this study believed that the number of meetings of BOTs is not sufficient, and further meetings were required. However, the problem is that the representative of the Minister must be present at all sessions. Besides, given four annual sessions to be held in all 45 universities in the country, holding further sessions is nearly impossible. Therefore, the participants believed that universities should be allowed to hold formal meetings without the presence of the Minister’s representative. In addition, most sessions are held in the capital city of Tehran and this will result in the fact that the provincial members are not aware of the problems of the region where the university is located. Besides, many members fail to participate actively in the meetings because of several reasons including an overload of the agenda, lacking the pertinent expertise for evaluating the agenda, lacking a sense of identity.

For example, a number of the participants explain this issue as follows:

“We have BOTs members who have not participated even once at the meetings held in university”.

“In the BOTs meeting of one of the universities, at the end of the session, we could later understand that one of the individuals attending the meeting is the member of BOTs because he had not spoken even a sentence throughout the session” (P9).

Theme III: Organizing

In this section, the most important extracted concepts included ‘ambiguity in the position’ and ‘lack of necessary administrative structure’.

Ambiguity in the Position of BOTs: Lack of transparency of BOTs’ law that defines the responsibilities of different principal units of the university (Board of Managers, University Council) would lead to an overlap of activities in some cases. In addition, some BOTs’ members believe that the Board of Trustees has a superficial position in the university because they usually approve only the decisions that are presented by the Ministry of Health or various units of the university. In other words, the BOTs have no role in the strategic leadership of universities and its maximum role is to approve defined agendas by the Ministry of Health and to review and give authority to university units that have problems in conducting their current affairs or require authorization. As it was mentioned, one of the reasons of functions overlaps is the lack of transparency of law; however, it is also because of the unfamiliarity of members with their duties and lack of clarity in the interdepartmental relationships of the university. One of the participants describes it as follows:

“For example, the issue which should be discussed in university council is presented to BOTs for approval” (P18).

Lack of Necessary Administrative Structure: If the members of BOTs would like to associate with academic units, the necessary administrative structure should be defined for the Board of Trustees’ office and communication channels need to be defined.

Theme IV: Performance Evaluation (Ensuring Proper Management of University)

At present, the subject of one of the annual meetings of BOTs is university performance evaluation. In this session, typically, the president and members of the university provide a report of their performance and the auditor presents a report on his/her assessments as well. Many of the participants believe that this evaluation fails to provide a genuine picture of the university’s performance. Problems associated with evaluation from the perspective of BOTs members are as follows:

• Self-reporting by different sections of university and the inability of members to verify it
• Lack of time allocation by BOTs’ members to attend university and familiarization with the plans
• Lack of evaluation criteria due to lack of approved long-term programs at university (passiveness in the face of reports)
• Lack of required infrastructure and tools for evaluation in BOTs such as needed technical committees.
Theme V: Independence and its Effect on Performance

Affiliation with the Ministry of Health: One of the main reasons for BOTs’ establishment in Iran is universities’ independence and avoidance of the dominated bureaucracy on their affairs. From the perspective of the participants in this study, the BOTs currently have no actual independence and what they have is superficial independence. The main reason for this is that the BOTs have no right and authority to select university president and the legality of BOTs decisions is pertaining to the approval of MOHME. Due to various reasons such as the need for complying with the course of action of universities with the country’s general policies, MOHME is reluctant to delegate authority to universities. In addition, it is believed that currently, BOTs members are not capable of running universities.

Attracting Financial Resources: The decrease of dependence on government sources, from the participants’ views, has a high priority for the autonomy of universities. However, it is believed that the BOTs are not successful in terms of the universities’ financial independence. Some actions were taken by universities (e.g., the use of donors’ support) have no direct connection with the activities of BOTs. The reasons for this include lack of adequate attention to donors, lack of time allocation by BOTs members to attract funds, lack of a proper platform for attracting public donations in BOTs and distrust of some donors to governmental systems.

Discussion

The findings indicate that with new legislation in recent years as well as delegating authority to BOTs of medical universities, a major part of the BOTs’ problems for university management is solved. However, given the outdated initial laws of BOTs and the changing national and international conditions, there is still a need for new legislation to complete such authorities. In addition, the application of such authorities has encountered many challenges due to reasons such as conflicts of BOTs laws with common rules of the country as well as challenges that the BOTs’ organizations face to coordinate with each other (6). Therefore, it is recommended to enact comprehensive legislation for BOTs in which the present chasms are well-considered and amended, including the followings:

- Considering the issue of providing health services in BOTs laws of MUs.
- Considering the central dimensions of university administration, such as planning and policy-making as well as evaluation-related tasks
  - Independence and accountability of BOTs (7)
  - Exactly defining of the position of BOTs in universities, especially in relation to other principal structures such as university board of managers and university council
  - Clarification of monitoring and the coordinating task of MOHME
  - The issue of selection and dismissal of university president (8)

In addition, the contradiction of BOTs authority laws with some of the country’s regulations should be removed (6). After the passage of this legislation, it would be required to formulate necessary guidelines so that the BOTs are empowered to use legal authority (9).

Lack of sufficient time allocated by BOTs is among the identified problems in this study. The results of other studies confirm this issue, which could be due to a number of reasons: first, these members believe that their position is not prominent in the management of the university. In fact, they assume that their absence does not make considerable changes in university performance; second, such members do not consider the task of BOTs as their main concerns; third, the members may not be aware of the importance of their role in university management. Lack of allocation of time is further witnessed (10), especially among the members who have joined BOTs due to social and political status. In addition, when selecting the members, the issue of knowledge and experience, commitment, individual capabilities as well as being indigenous should be considered (10). Therefore, it is generally recommended to make use of influential political figures through other means (such as an honorary membership), and there is no need for their permanent membership in BOTs.

The problem of insufficient time allocation, poor and ineffective participation in university activities and meetings, and the replacement of BOTs members are the common challenges which have been seen in other university BOTs’ experiences. However, up to the time that the duty of providing health services is the responsibility of medical universities, the presence of health service provider representatives’ members seems to be necessary for BOTs composition in addition to representative members from academia (3).

The members, especially those who join the BOTs from outside medical universities, should be empowered through training courses or other means. In such sessions, familiarization with university tasks, duties of BOTs members, financial issues, laws, and regulations related to universities and other country’s statutory regulations can be provided (11, 12).

Lack of expert committees for the screening of agendas and helping decision-making system is among the existing problems of BOTs. Conducting a part of the present duties of BOTs, particularly monitoring the performance of the university president as well as financial affairs, requires a permanent committee to change the university performance evaluation from the state of mere self-reporting by the university president (13). In this regard, the proposed committees, according to international experiences, include executive, budget and finance, buildings and lands, auditing, evaluation, human resources, development and public relations (14).

Lack of a university roadmap is also one of the main problems noted by participants. This roadmap determines the overall direction of university activities as well as priorities. It can convert the passive decision-making process into an active one, which can provide a framework for innovation in need-based planning (9). In addition, according to this roadmap, it can be determined whether the
**Board of trustees’ in medical universities**

BOTs agenda is in line with this plan. Also, the existence of a roadmap helps develop the screening system of agenda and provides BOTs members with valid criteria for the assessment of university activities on the basis of which they can evaluate the performance of university managers (9).

Low meetings is another problem reported in this study that is consistent with other studies (11, 15, 16). However, holding specialized sessions is part of successful reforms recently done by the Ministry of Health in this area. Accordingly, in addition to increasing the number of sessions and allowing universities to hold a session with specific issues (9 to 12 sessions), it is recommended to hold such meetings on the university campuses in order to involve BOTs’ members more than ever. As mentioned in previous discussions, the ability to attend meetings should be considered as one of the selection criteria of BOTs members.

The findings suggest that BOTs aren’t satisfied with their current independence, and they formally and informally are subordinated to the policies of the Ministry of Health and university managers. This issue is also among the results of other studies (17, 18). The main indexes of lack of BOTs independence include the following items: the selection of university president, lack of financial independence, employment, and MOHME permission requirement to verify BOTs decisions. But legally, it has been clearly stipulated in BOTs law and BOTs have this right and responsibility (19). One of the most important needed actions is financial independence and universities should not be just financially dependent on the government (9, 14). In this regard, enabling the option of donors’ aid is suggested as a means to increase the income of universities.

The finding argues for the lack of university independence is that with the current situation, BOTs are not able to manage universities. In addition, the independence of universities may result in non-compliance of university policies with the general policies of the country in the field of science and technology as well as providing health services (20). Therefore, some countries prefer the subordination of universities to government or ministry of science planning (20). In order to solve this problem, it is suggested to establish centralized BOTs in the Ministry of Health to decide on such policies, as there are some experiences in this field (20).

One of the main tasks of BOTs is the evaluation of institution performance (11). At present, monitoring of university president activities is mostly conducted through a self-reporting system, and there is no approved clear and comprehensive structure. In order to ensure proper management of the institution the BOTs, while regulating stronger mechanisms of performance evaluation (in addition to the auditor’s and university president’s report), should create monitoring and evaluation mechanisms for the performance of the university president and subunits (13). However, its prerequisite is the allocation of enough time to the issue at hand. The existence of long-term approved plans, as well as permanent specialized committees, can be helpful in this regard.

**Limitations of the study**

In designing this study, all the best effort has been made to involve the most informed participants about BOTs’ issue who had job experience in this field. This study had some potential limitations that may affect the results. Some participants may not have expressed their real views and concerns due to various reasons such as unacceptability of their views from a political point of view and dissimilarity of their opinions with the BOTs’ chairperson. In addition, although it was believed that the viewpoints of the BOTs’ chairperson of the Ministry of Health could make a major contribution to the study, we failed to interview him due to his pre-engagements.

**Conclusion**

The structural and functional reforms of university BOTs affiliated with the Ministry of Health and Medical Education seem to be indispensable due to obsolete BOTs regulations and the difference between medical universities and other universities regarding their functions in providing health services. Hence, the policy-makers, while believing in the autonomy of universities and commitment to this issue, must embark on a comprehensive, transparent legal approach. By using this pervasive approach, the authorities of BOTs members are increased, and their empowerment, as well as their selection method, are taken into consideration so that the independence of universities’ performance, as the main objective of BOTs existence in universities, would be achieved.

**Acknowledgment**

The authors would like to thank the Central Secretariat of the Board of Trustees of the Ministry of Health and also the Budgeting and Performance Monitoring Center in Iran Ministry of Health and Medical Education. Our special thanks to all boards of the trustees’ members who participated in this study. We also thank the members involved in the research department of Iran University of Medical Sciences.
