modification presented all providers with a list of abx options including dosage and frequency. The effects of two CDS interventions were assessed for one year.

Results. Results indicate the IG improved in BPA abx compliance over the CG. Figure 1 shows compliance with BPA recommended antibiotics among the IG increased from 17% to 23% during Q1.2014-Q2.2017 compared with a 0% increase in the CG (P < 0.001). However, overall IDSA recommended compliance did not significantly increase: IG -2% vs CG 1% (P = 0.26). UTI patients of providers who saw the BPA alert were 1.9 times (CI: 1.7, 2.3) times more likely to receive recommended abx compared with the CG.

Conclusion. This randomized control study provides promising data that the use of CDS, specifically BPA embedded within EMRs, can be used effectively to assist and encourage compliance with guidelines. Next steps include: continuing to educate providers on best practices, consider including more abx options in BPA to reduce errors in prescribing and improve overall compliance, and implementing similar CDS interventions for upper respiratory infections and other infections.

756. Emergency Department Specific Antimicrobial Stewardship Intervention Reduces Antibiotic Duration and Selection for Discharged Adult and Pediatric Patients with Skin and Soft-tissue infections

Renee Trajano, BS1; Susan Omid, MD, MD2; Dan Tancredi, PhD3; Jean Wiedeman, MD, MD1, PhD4; Stu Hart. Cohen, MD, FIDSA, FSHEA, FACIP5; Loren Miller, MD, MPH1; Chance Anderson, MS2 and Larissa May, MD, MS1, PhD1; 1University of California Davis, Sacramento, California, 2UC Davis, Sacramento, California, 3Pediatrics, University of California Davis Medical Center, Sacramento, California, 4Internal Medicine, University of California, Davis Medical Center, Sacramento, California, 5Infectious Disease Clinical Outcomes Research, Los Angeles Biomed at Harbor-University of California - Los Angeles Medical Center, Torrance, California, 6Emergency Medicine, University of California-Davis, Sacramento, California

Session: 75. Stewardship: Program Implementation
Thursday, October 5, 2017: 12:30 PM

Background. Skin and soft-tissue infections (STSI) account for 2.4 million annual U.S. emergency department (ED) visits. A majority of physicians give empiric antibiotic treatment that is non-compliant with guidelines, leading to potential patient harm and fuelling the emergence of antibiotic resistance. The ED is a deserving focus of antimicrobial stewardship yet interventions have not been well studied in this setting.

Methods. Quasi-experimental study of a multifaceted antimicrobial stewardship intervention at an academic ED in a setting of high prevalence of clindamycin resistance among S. aureus. Our intervention included educational presentations by a physician champion, implementation of an electronic order set based on 2014 IDSA guidelines, dissemination of an ED specific S. aureus wound isolate antibiogram, monthly departmental peer-comparisons, and bimonthly, confidential, individual audit and feedback. Visits with ICT-10 codes for cutaneous abscess or other STSI for patients discharged to home from the ED for consented providers were included for analysis. Primary endpoint of antibiotic selection and treatment duration was assessed during the pre-intervention and intervention periods using contingency tables for categorical outcome and a linear regression model for clustered survey data for comparing mean durations.

Results. Seventy-four consented providers’ data were included, accounting for 310 patient visits over the baseline (Oct 15-Mar 16) and 315 visits over the intervention period (Oct 16-Mar 17). Mean antibiotic duration decreased from 9.5 to 6.5 days, a difference (95% CI adjusted for provider cluster effects) of -3.0 (-6.0, -2.0) days. Among patients discharged with a diagnosis of cellulitis, cephalixin use increased from 22% to 42%, with clindamycin use declining from 58% to 28%.

Conclusion. Our ED specific antibiotic stewardship program successfully reduced antibiotic duration and improved guideline adherence in discharged patients with STSI. Similar implementation strategies should be assessed in a wider variety of settings.

757. Antibiotic Stewardship in the Medical Intensive Care Unit of an Academic Medical Center: Impact of a Pneumonia Diagnostic Bundle with Pharmacist Intervention

James Kidd, PharmD, BCPS1; Daniel Speziale, MD2; Hannah Spinnaker, PharmD3; BCCCP3; Jennifer Schimmel, MD3; Abigail Orenstein, MD MPH4 and Porschman, PharmD4; BCPS4 (Q-ID); 1Pharmacy, Baystate Medical Center, Springfield, MA, 2Pulmonary and Critical Care Medicine, Baystate Medical Center, Springfield, MA, 3Infectious Diseases, Baystate Medical Center, Springfield, MA, 4Critical Care and Infectious Disease, Baystate Medical Center/Tufts University, Springfield, MA

Session: 75. Stewardship: Program Implementation
Thursday, October 5, 2017: 12:30 PM

Background. Acute bacterial pneumonia is a common empiric diagnosis in medical intensive care unit (MICU) patients. Clinically, however, it may be difficult to distinguish from nonbacterial causes of infection and injection of the lung(s). Incomplete diagnostic workup at the time of empiric antibiotic initiation or misinterpretation of available data may impede antibiotic de-escalation and discontinuation. We aimed to reduce unnecessary antibiotic use in the MICU by (1) bundling pneumonia diagnostic orders into a single comprehensive order set and (2) by implementing a daily pharmacist-driven antibiotic time-out.

Methods. This before-and-after quality improvement pilot project was conducted in the MICU of a Baystate Medical Center, a closed 16-bed, unit, from December 2016 through March 2017. Outcomes were compared with a baseline period from December 2015 through March 2016. At baseline, all diagnostic orders were entered individually via computer physician order entry (CPOE) and daily antibiotic stewardship was not provided. For the pilot, a pneumonia order set was built which includes all diagnostic tests and recommended empiric antibiotics based on the local antibiogram. Of note, serial procalcitonin levels first became available at our institution through this order set. An interpretation algorithm was adapted from the literature to aid in their interpretation. A new MICU clinical pharmacist position was created which allowed antibiotic time-outs to be conducted 7 days per week. Antibiotic discontinuation was assessed by comparing days of antibiotic therapy per 1000 patient-days.

Results. For all antibiotics used to treat bacterial pneumonia, total days of therapy per 1000 patient-days in the MICU decreased from 905.7 in the baseline period to 688.4 in the pilot period (rate difference -213.9, 95% CI -270.8 to -163.9). The usage of narrow spectrum antibiotics increased during the pilot period.

Conclusion. Bundling pneumonia diagnostic orders together into a single order set inclusive of serial procalcitonin measurement as well as providing daily pharmacist-driven antibiotic time-outs were associated with decreased antibiotic usage in the MICU.

Session: 75. Stewardship: Program Implementation
Thursday, October 5, 2017: 12:30 PM

Background. As an 886-bed tertiary care hospital with both teaching and private physician groups, Cedars-Sinai Medical Center has a unique opportunity to incorporate antimicrobial stewardship programs with both a general medicine teaching service (TS) as well as a non-teaching hospitalist group (NTH). The impact of ASP rounds on antimicrobial (ABX) utilization and notable differences in clinical outcomes associated with both rounding models were evaluated.

Methods. An ASP was incorporated into existing teaching rounds for TS and disposition planning rounds for NTH. ASP-TS and ASP-NTH rounds both occurred once daily on weekdays with facetime of 3-4 hours per day for TS and 0.5-1 hour per day for NTH. Metrics included ASP recommendations and acceptance rates, total ASP time, ABX days-of-therapy (DOT) and clinical outcomes. Chi-squared and the Student’s t-test were used as appropriate.

Results. Between November 2016 to April 2017, ASPs reviewed 3184 NTH patients and 1322 TS patients. More opportunities for ASP intervention were identified with TS (40% vs. 26%, P < 0.001). Overall recommendation acceptance rates were higher for TS compared with NTH (95% vs. 79%, P < 0.001). Total recommendations identified per ASP hour were 1.9 times (CI: 1.7, 2.3) times more likely to receive recommended abx compared with the CG. UTI patients of providers who saw the BPA alert were 1.9 times (CI: 1.7, 2.3) times more likely to receive recommended abx compared with the CG.

Conclusion. Our ED specific antibiotic stewardship program successfully reduced antibiotic duration and improved guideline adherence in discharged patients with STSI. Similar implementation strategies should be assessed in a wider variety of settings.
