**Abstract:** Many *Helianthemum* species (Cistaceae) are recognized for their various medicinal virtues. *Helianthemum ruficomum* is an endemic species to the septentrional Sahara on which no report is available so far. The purpose of this work was to investigate the chemical composition and the radical scavenging capacity of this species and its isolated components. Collected from Mougheul (south-west of Algeria), the aerial parts were macerated with 80% EtOH/H₂O, after evaporation, the remaining extract was diluted with H₂O and extracted with petroleum ether, chloroform, ethyl acetate and n-butanol. EtOAc and n-BuOH extracts were evaluated for their free radical scavenging capacity by on-line HPLC-ABTS•⁺ assay. The obtained data which were confirmed by TEAC and ORAC assays, allowed guiding the fractionation of these extracts by CC, TLC and reverse phase HPLC. Among the components, 14 were isolated and identified by spectroscopic analyses: protocatechuic acid (1), *trans*-tiliroside (2), *cis*-tiliroside (3), astragalin (4), picein (7), vanillic acid 4-*O*-β-D-glucopyranoside (8), lavandoside (9), 4-hydroxybenzoic acid 4-*O*-β-D-glucopyranoside (10), nicotiflorin (11), rutin (12), vicenin-2 (13), narcissin (14) and stigmasterol (5) and β-sitosterol (6) as a mixture (71% and 29%, respectively). Compounds 5, 7, 8, 9, 10 and 14 were new for the genus *Helianthemum*. The antioxidant power of all the isolated compounds was also evaluated by HPLC-ABTS•⁺, TEAC and ORAC assays. The results clearly indicated high antioxidant potential of the extracts and tested compounds of this species especially, compounds 1, 4, 8, 9, 10 and 12.

**Keywords:** *Helianthemum ruficomum*; Cistaceae; antioxidant activity; HPLC-ABTS•⁺; TEAC; ORAC

1. **Introduction**

Currently, there is an increasing interest in the research and prospection of new sources of natural antioxidants as safe additives in food industry or ingredients of functional foods, nutraceuticals and pharmaceuticals. Free radicals are major contributors in aging and play a key role in degenerative diseases [1–3]. Sahara species can develop metabolite responses against drought stress and ROS produced by extensive UV exposition [4–6]. According to this finding and the results of our previous studies on Saharan species which showed the presence of high content of bioactive compounds and positive antioxidant and antiproliferative properties [7–10], we investigate in this study, extracts of an
endemic species of the septentrional Sahara, *Helianthemum ruficomum* from the Cistaceae family by on-line HPLC-ABTS** method in order to evaluate their antioxidant capacities.

Cistaceae consists of 8 genera and about 180 species [11]. *Helianthemum* genus (Cistaceae) contains approximately 110 species [12], some of them are important medicinal plants used in several countries for different purposes [13–17]. This genus is reported to possess anti-inflammatory, antimicrobial, antiprotozoal and antioxidant properties [18–22]. Even if this genus was not studied much from the phytochemical viewpoint, some species have been previously examined for bioactive components like flavonoids, phenolic acids, lignans and essential oils [23–28].

To the best of our knowledge, the species *Helianthemum ruficomum* (Viv.) Sennen (synonyms: *Cistus ruficomus* Viv., *Helianthemum arnaizii* Sennen, *H. desiderii* Sennen, *H. hirtum* subsp. *ruficomum* (Viv.) Maire, *H. cremophilum* Pomel, *H. hirtum* var. *deserti* Coss., *H. desertorum* Willk. [29–31] has not been previously studied. In this work, ethyl acetate and *n*-butanol soluble parts of the aqueous-EtOH extract of the aerial parts were investigated using liquid chromatography with post-column reaction allowing a direct on-line detection of radical scavenging power of molecular species. A special focus was done on the evaluation of free radical scavenging capacities (ABTS•+, TEAC, ORAC assays and on-line HPLC-ABTS••) of extracts and isolated compounds. The structures of the isolated compounds were elucidated using ESI-HRMS, molecular absorption spectroscopy, extensive application of one- and two-dimensional NMR spectroscopy and comparison with literature data.

2. Results and Discussion

2.1. Isolation and Structure Elucidation of Compounds

Chromatographic procedures (CC and TLC of silica gel 60 and semi-preparative reverse phase HPLC) led to the isolation from the aerial parts of *Helianthemum ruficomum*, of five phenolic acids: protocatechuic acid (1) [32], picein (7) [33], vanillic acid 4-O-β-D-glucopyranoside (8) [34], lavandoside (trans-Ferulic acid 4-O-β-D-glucopyranoside) 9 [35,36], 4-hydroxybenzoic acid 4-O-β-D-glucopyranoside (10) [37]; seven flavonoid glycosides: trans-tiliroside (2) [38,39], slightly contaminated by its stereoisomer cis-tiliroside, cis-tiliroside (3) [38,39] contaminated by trans-tiliroside, astragalin (4) [40], nicotiflorin (11) [41], rutin (12) [41], vicenin-2 (13) [42], narcissin (14) [41], and a mixture (71%–29%) of stigmasterol (5) and β-sitosterol (6), respectively [43], (Figure 1). The compounds were identified by spectral analysis, mainly ESI-HRMS, UV and NMR experiments (1H, 13C, DEPT, DOSY, COSY, NOESY, HSQC and HMBC) and comparison of their spectroscopic data with those reported in the literature. To the best of our knowledge, compounds 5, 7, 8, 9, 10 and 14 were new for the genus *Helianthemum*. In addition, all the isolated compounds were described for the first time from this species. The spectra of all the compounds are available in the Supplementary Materials.

![Figure 1. Cont.](image-url)
Protocatechuic acid (1): ESI-HRMS(+) : m/z 155.03358 [M + H]+, accurate mass 154.0263; formula: C7H6O4; 1H-NMR (400 MHz, CD3OD) δH (ppm) 7.35 (1H, d, J = 1.8 Hz, H-2), 7.30 (1H, dd, J = 8.0, 1.8 Hz, H-6), 6.72 (1H, d, J = 8.0 Hz, H-5); 13C-NMR (100 MHz, CD3OD) δC (ppm) 168.87 (C-7), 149.76 (C-4), 144.72 (C-3), 123.09 (C-1), 122.56 (C-6), 116.91 (C-2), 114.95 (C-5).

trans-Tiliroside (2): Yellow powder, ESI-HRMS(+) : m/z 617.12741 [M + Na]+, 595.14507 [M + H]+, formula: C30H26O13; 1H-NMR (400 MHz, DMSO-d6) δH (ppm) aglycone: 7.98 (2H, d, J = 8.8 Hz, H-2′, H-6′), 6.84 (2H, d, J = 8.8 Hz, H-3′, H-5′), 6.26 (1H, d, J = 1.6 Hz, H-8), 6.05 (1H, d, J = 1.6 Hz, H-6), sugar moiety: 5.41 (1H, d, J = 6.8 Hz, H-1″a), 4.28 (1H, dd, J = 12.0, 2.8 Hz, H-6″a), 4.03 (1H, dd, J =12.0, 5.2 Hz, H-6″b), 3.40 (1H, m, H-5″), 3.30 (1H, m, H-3″), 3.25 (1H, m, H-2″), 3.19 (1H, m, H-4″), p-coumaroyl moiety: 7.36 (1H, d, J = 16.0 Hz, H-7″″), 6.79 (2H, d, J = 8.8 Hz, H-3″″, H-5″″), 6.13 (1H, d, J = 16.0 Hz, H-8″″); 13C-NMR (100 MHz, DMSO-d6) δC (ppm) aglycone: 177.31 (C-4), 166.69 (C-5), 161.54 (C-5′), 160.38 (C-4′), 157.07 (C-9), 157.06 (C-2), 133.40 (C-3), 131.18 (C-2′, C-6′), 121.28 (C-1′), 115.53 (C-3′, C-5′), 103.30 (C-10), 99.99 (C-6), 94.55 (C-8), sugar moiety: 101.79 (C-1″), 76.71 (C-3″), 74.66 (C-5″), 74.60 (C-2″), 70.39 (C-4″), 63.46 (C-6″), p-coumaroyl moiety: 166.69 (C-9″), 156.36 (C-4″′), 145.13 (C-7″″), 130.64 (C-2″′, C-6″′), 125.30 (C-1″″), 116.31 (C-3″″, C-5″″), 114.04 (C-8″″). This compound was slightly contaminated by its stereoisomer cis-tiliroside.

cis-Tiliroside (3): This compound was obtained as a mixture with trans-tiliroside (2) (42% trans-tiliroside-58% cis-tiliroside). Yellow powder, ESI-HRMS(+) : m/z 595.14494 [M + H]+, formula: C30H26O13; 1H-NMR (500 MHz, CD3OD) δH (ppm) aglycone : 7.99 (2H, d, J = 8.9 Hz, H-2′, H-6′), 6.80 (2H, d, J = 8.9 Hz, H-3′, H-5′), 6.31 (1H, d, J = 2.0 Hz, H-8), 6.18 (1H, d, J = 2.0 Hz, H-6), sugar moiety: 5.18 (1H, d, J = 7.5 Hz, H-1″a), 4.28 (1H, dd, J = 12.0, 2.8 Hz, H-6″a), 4.18 (1H, dd, J = 12.0, 5.2 Hz, H-6″b), 3.45 (1H, m, H-5″), 3.43 (1H, m, H-3″), 3.40 (1H, m, H-2″), 3.28 (1H, m, H-4″), p-coumaroyl moiety: 7.51(2H, d, J = 8.8 Hz, H-2″″, H-6″″), 7.31(2H, d, J = 8.0 Hz, H-3″″, H-5″″), 6.80 (1H, d, J = 12.3 Hz, H-7″″), 5.51(1H, d, J = 12.3 Hz, H-8″″); 13C-NMR (125 MHz, CD3OD) δC (ppm) aglycone: 177.98 (C-4), 163.61 (C-7), 161.54 (C-5), 159.84 (C-4′), 157.24 (C-2),157.18 (C-9), 133.78 (C-3), 130.87 (C-2′, C-6′), 121.34 (C-1′), 115.42 (C-3′, C-5′), 102.71 (C-10), 97.40 (C-6), 94.91 (C-8), sugar moiety: 101.94 (C-1″″), 76.61.
Vanillic acid 4-O-(CH_3)_{n} sugar moiety: 100.79 (C-11), 111.94 (C-7), 110.14 (C-9), 50.46 (CH, C-12), 37.63 (CH, C-1), 36.10 (C, C-10), 32.11 (CH, C-2), 31.83 (CH and CH, C-7 and C-8), 29.64 (CH, C-25), 29.31 (CH, C-15), 25.45 (CH, C-25), 24.44 (CH, C-15), 21.72 (CH, C-19), 21.50 (CH, C-11), 20.23 (CH, C-9), 18.92 (CH, C-27), 18.93 (CH, C-24), 18.25 (CH, C-28), 12.25 (CH, C-29), 12.14 (CH, C-24).

β-Sitosterol (6): White crystals; HRMS(+) m/z 414.3864 [M]+, formula: C_{29}H_{48}O_{3}; ^{1}H-NMR (500 MHz, CDCl_{3}) δ_{H} (ppm): 5.34 (1H, br, d, J = 6.4 Hz, H-6), 3.54 (1H, m, H-3), 1.02 (3H, s, H-9), 0.94 (3H, d, J = 6.2 Hz, H-19), 0.85 (3H, d, J = 7.2 Hz, H-23), 0.84 (3H, d, J = 6.4 Hz, H-26), 0.81 (3H, d, J = 6.4 Hz, H-27), 0.68 (3H, s, H-28); ^{13}C-NMR (125 MHz, CDCl_{3}) δ_{C} (ppm): 140.65 (C, C-5), 126.12 (CH, C-6), 71.80 (CH, C-3), 56.78 (CH, C-14), 56.12 (CH, C-17), 50.19 (CH, C-9), 45.89 (CH, C-22), 42.34 (C, C-13), 39.83 (CH, C-12), 37.28 (CH, C-1), 36.52 (C, C-10), 36.14 (CH, C-18), 33.99 (CH, C-2), 31.92 (CH and CH, C-7 and C-8), 31.65 (CH, C-2), 29.24 (CH, C-25), 28.24 (CH, C-16), 26.20 (CH, C-21), 24.30 (CH, C-15), 23.13 (CH, C-23), 21.12 (CH, C-11), 19.79 (CH, C-28), 19.38 (CH, C-27), 19.07 (CH, C-26), 18.78 (CH, C-19), 11.98 (CH, C-24), 11.81 (CH, C-29), 11.98 (CH, C-29). This compound was obtained as a mixture with stigmasterol (5) (29 and 71%, respectively).

Picein (7): ESI-HRMS(+): m/z 321.09386 [M + Na]^{+}, 619.19864 [2M + Na]^{+}, accurate mass 298.10461; formula: C_{12}H_{19}O_{3}, m/z 137.05910 [M + H - 162]^{+} indicating the presence of a hexose moiety linked to the rest of the molecule by an O-glycosidic bond; ^{1}H-NMR (400 MHz, DMSO-d_{6}) δ_{H} (ppm) aglycone: 7.91 (2H, d, J = 8.6 Hz, H-2, H-6), 7.11 (2H, d, J = 8.6 Hz, H-3, H-5), 2.51 (3H, s, H-3), sugar moiety: 4.99 (1H, d, J = 7.2 Hz, H-1), 3.69 (1H, br, d, J = 12.1 Hz, H-6′a), 3.48 (1H, dd, J = 12.1, 5.9 Hz, H-6′b), 3.42 (1H, m, H-5′), 3.35 (1H, m, H-3′), 3.30 (1H, dd, J = 9.2, 7.2 Hz, H-2′), 3.19 (1H, t, J = 9.2 Hz, H-4′); ^{13}C-NMR (100 MHz, DMSO-d_{6}) δ_{C} (ppm) aglycone: 198.99 (C-7), 162.25 (C-4), 132.07 (C-1), 131.73 (C-2, C-6), 117.18 (C-3, C-5), 27.64 (C-8), sugar moiety: 100.79 (C-1′), 77.93 (C-5′), 77.26 (C-3′), 74.16 (C-2′), 70.72 (C-4′), 61.74 (C-6′).

Vanillic acid 4-O-β-d-glucopyranoside (8): ESI-HRMS(+): m/z 353.08341 [M + Na]^{+}, formula: C_{14}H_{18}O_{9}, m/z 169.04893 [M + H - 162]^{+} indicating the presence of a hexose moiety linked to the rest of the molecule by an O-glycosidic bond; ^{1}H-NMR (400 MHz, CD_{3}OD) δ_{H} (ppm) aglycone: 7.56 (1H, dd, J = 8.4, 2.0 Hz, H-6), 7.51 (1H, d, J = 2.0 Hz, H-2), 7.12 (1H, d, J = 8.4 Hz, H-5), 3.83 (3H, s, OCH_{3}), sugar moiety: 5.04 (1H, d, J = 7.2 Hz, H-1), 3.85 (1H, br, d, J = 12.0 Hz, H-6′a), 3.67 (1H, dd, J = 12.0, 5.6 Hz, H-6′b), 3.55 (1H, t, J = 8 Hz, H-2′), 3.53 (1H, m, H-3′), 3.48 (1H, m, H-5′), 3.42 (1H, m, H-4′); ^{13}C-NMR (100 MHz, CD_{3}OD) δ_{C} (ppm) aglycone: 167.65 (C-7), 148.67 (C-4), 146.96 (C-3), 123.03 (C-1), 122.35 (C-6′), 113.32 (C-5′), 111.59 (C-2′), 54.21 (OCH_{3}), sugar moiety: 98.72 (C-1′), 75.01 (C-5′), 74.49 (C-3′), 71.64 (C-2′), 68.17 (C-4′), 59.34 (C-6′).
**Vicenin-2**

- **ESI-HRMS+**: m/z 379.09896 [M + Na]+, 735.20725 [2M + Na]+ according to the molecular formula C16H20O8, m/z 195.06445 [M + H − 162]+ indicating the presence of a hexose moiety linked to the rest of the molecule by an O-glycosidic bond;
- **1H-NMR (400 MHz, CD3OD)** δH (ppm) aglycone: 7.62 (1H, d, J = 16.4 Hz, H-7), 7.25 (1H, brs, H-2), 7.19 (1H, d, J = 8.0 Hz, H-5), 7.18 (1H, brd, H-6), 6.41 (1H, d, J = 16.4 Hz, H-8), 3.91 (3H, s, OCH3), sugar moiety: 4.99 (1H, d, J = 7.3 Hz, H-1′′′), 3.89 (1H, dd, J = 10.2, 3.9 Hz, H-6′′′a), 3.71 (1H, dd, J = 10.2, 5.8 Hz, H-6′′′b), 3.54 (1H, m, H-2′′′), 3.52 (1H, t, J = 8.0 Hz, H-3′′′), 3.45 (1H, m, H-5′′′), 3.43 (1H, m, H-4′′′);
- **13C-NMR (100 MHz, CD3OD)** δC (ppm) aglycone: 169.39 (C-9), 149.58 (C-3), 148.51 (C-4), 144.45 (C-7), 129.31 (C-1), 121.99 (C-6), 116.84 (C-8), 116.01 (C-5), 111.03 (C-2), 55.40 (OCH3), sugar moiety: 100.82 (C-1′′′), 76.87 (C-5′′′), 76.44 (C-3′′′), 73.42 (C-2′′′), 69.89 (C-4′′′), 61.07 (C-6′′′).

**Lavandoside (trans-ferulic acid 4-O-β-D-glucopyranoside)**, 9:
- **ESI-HRMS−**: m/z 299.0772 [M − H]-, formula: C13H16O5; **1H-NMR (500 MHz, CD3OD)** δH (ppm) aglycone: 7.98 (2H, d, J = 9.0 Hz, H-2, H-6), 7.14 (2H, d, J = 9.0 Hz, H-3, H-5), sugar moiety: 5.03 (1H, d, J = 7.3 Hz, H-1′′′), 3.92 (1H, dd, J = 12.5, 2.5 Hz, H-6′′′a), 3.73 (1H, dd, J = 12.5, 5.5 Hz, H-6′′′b), 3.52 (1H, m, H-5′′′), 3.51 (1H, m, H-3′′′), 3.50 (1H, m, H-2′′′), 3.44 (1H, m, H-4′′′); **13C-NMR (125 MHz, CD3OD)** δC (ppm) aglycone: 169.89 (C-7), 160.86 (C-4), 131.10 (C-2, C-6), 126.89 (C-1), 115.57 (C-3, C-5), sugar moiety: 100.34 (C-1′′′), 76.84 (C-5′′′), 76.55 (C-3′′′), 74.46 (C-2′′′), 69.91 (C-4′′′), 61.06 (C-6′′′)."
which showed a relatively high molecular absorbance on the upper chromatogram (Figure 3), exhibited by off-line TEAC test, confirmed these results and showed that EtOAc and Helianthemum ruficomum (Table 3), ORAC essay values: 690, 651, 435 and 613 µMTE/mg respectively (Tables 1 and 2), off-line ABTS values: 202, 75, 254 and 644 mAU respectively (Tables 1 and 3). The phenolic compound 1 may be due the lack of glycosylation, which has been found to diminish the antioxidant activity (Table 1). The off-line ABTS assay of the isolated compounds showed also that protocatechuic acid (1) and rutin (12) showed relatively high radical scavenging capacity (Tables 1 and 2), in particular vanillic acid 4-O-β-D-glucopyranoside (4), which also showed high antioxidant activity (Figure 2) could not be isolated in pure state and then were not identified. These five components represented 62.21% of the ethyl acetate extract and only 10.34% of the total antioxidant activity of EtOAC extract (Table 1) as the compounds D and E which also showed high antioxidant activity (Figure 2) could not be isolated in pure state and then were not identified. These five components represented 62.21% of the ethyl acetate extract antioxidant activity (Table 1). trans-Tiliroside (2), cis-tiliroside (3), nicotiflorin (11) and narcissin (14) which showed a relatively high molecular absorbance on the upper chromatogram (Figure 3), exhibited little or no radical scavenging capacities. These results were confirmed off-line by ABTS, ORAC and TEAC assays. The measure of the free radical scavenger capacity of the two studied extracts of Helianthemum ruficomum by off-line TEAC test, confirmed these results and showed that ETOAc and n-BuOH extracts exhibited comparable activities (TEAC 432 and 431 µMTE/mg, respectively, Table 3). This may be in relation with the strongest amount of phenolic and flavonoid compounds in these extracts. The off-line ABTS assay of the isolated compounds showed also that protocatechuic acid (1), vanillic acid 4-O-β-D-glucopyranoside (8), 4-hydroxybenzoic acid 4-O-β-D-glucopyranoside (10) and rutin (12) were the most potent antioxidant with on-line ABTS assay values: 341, 833, 823 and 594 mAU respectively (Tables 1 and 2), off-line ABTS values: 202, 75, 254 and 644 mAU respectively (Table 3), ORAC essay values: 690, 651, 435 and 613 µMTE/mg respectively (Table 3) and TEAC assay values: 469, 106, 408 and 556 µMTE/mg (Table 3). The higher activity of rutin (12) in comparison to the other flavonoid glycosides present in these extracts may be due to the presence of the ortho di-OH system on the ring B of this molecule [44]. In addition, the higher activity of protocatechuic acid (1) in comparison with vanillic acid 4-O-β-D-glucopyranoside (8) and 4-hydroxybenzoic acid 4-O-β-D-glucopyranoside (10) may be due the lack of glycosylation, which has been found to diminish
the radical scavenging activity [45]. This was also observed for ferulic acid glucoside (9), which showed relatively low antioxidant activity in comparison with ferulic acid [46,47].

The presence in this species, of phenolic acids and flavonoids was in good agreement with major studies reported on \textit{Helianthemum} species [14,24,26,27]. The strong accumulation by this species, of \textit{trans}-tiliroside which has been demonstrated to exert multiple biological effects [48,49] and the high antioxidant potential of its extracts and tested compounds, emphasized the possible relevance of this plant for Algerian traditional medicine. Moreover, it is important to note that no report has been published so far on eventual ethnomedical uses of this species. This may be due to a low distribution of this species.

**Figure 2.** Chromatographic determination of antioxidant compounds (upper chromatogram) and their corresponding antioxidant activity (lower chromatogram) in ethyl acetate extract of \textit{H. ruficomum}. Protocatechuic acid (1), \textit{trans}-tiliroside (2), \textit{cis}-tiliroside (3), astragalin (4), unidentified compounds (A, B, C, D and E).

(Results expressed as mean ± SD, n = 3).

3. Materials and Methods

3.1. General Procedure

Ultraviolet spectra were recorded using a Shimadzu model UV-1700 spectrophotometer. NMR spectra were obtained by Bruker model Avance 400 and AMX-500 spectrometers (Bruker BioSpin, Rheinstetten, Germany) with standard pulse sequences, operating at 400 and 500 MHz for ¹H and 100 and 125 MHz for ¹³C, respectively. MeOH-d₄, DMSO-d₆, or CDCl₃ were used as solvents with TMS as internal standard. High resolution mass spectra (ESI-HRMS) were performed on a Agilent 6520 Accurate Mass Q-TOF (Agilent Corporation, Santa Clara, CA, USA) and a µ-QToF spectrometer (Bruker Daltonics, Wissembourg, France). Column chromatography (CC) was carried out with Si gel Fluka (cat. 60737, 40–63 µm), and column fractions were monitored by TLC Si gel 60 F₂₅₄, 0.2 mm, Macherey Nagel (cat. 818–333) by detection with a spraying reagent (CH₃CO₂H/H₂O/H₂SO₄; 80:16:4) followed by heating at 100 °C. Preparative TLC was carried out on Si gel 60 PF₂₅₄+366 (20 cm × 20 cm, 1 mm thickness, Analtech cat. 02014).
3.2. Plant Material

The plant material was collected from the area of Mougheul in the south-west of Algeria, latitude: N 32° 1’23.6928” (+32° 1’23.6828”), longitude W 2° 13’3.0648” (~2° 13’3.0648”) and authenticated by M. Mohamed Ben Abdelhakem, director of the nature preservation agency, Bechar on the basis of Quezel and Santa [23]. A voucher specimen (HCC0512-MOG-ALG-60) has been deposited at the Herbarium of the VARENBIOMOL research unit, Université des Frères Mentouri Constantine 1.

3.3. Extraction and Isolation

Air-dried aerial parts (1448 g) of Helianthemum ruficomum (Cistaceae) were macerated at room temperature with EtOH/H₂O (80:20, v/v) for 72 h, three times. After filtration, the filtrates were concentrated in vacuum (up to 35 °C) and dissolved in distilled H₂O (900 mL) under magnetic stirring and then put at the refrigerator for one night. After filtration, the resulting solution was dried with Na₂SO₄, filtered using common filter paper and concentrated in vacuum up to 35 °C to obtain the following dry extracts: petroleum ether (0.135 g), CHCl₃ (0.9 g), EtOAc (5.142 g), n-BuOH (22.938 g). A part of the EtOAc extract (4 g) was dissolved in 5 mL of MeOH and subjected to column chromatography on silica gel (60–200 mesh, 0.135 g) eluted with CHCl₃/MeOH step gradients to yield 33 fractions (F₁–F₃₃) obtained by combining the eluates on the basis of TLC analysis. Fraction F₁₂ (57.8 mg) (CHCl₃/MeOH, 96:4), was submitted to preparative plates of silica gel (CHCl₃/MeOH, 12:1) to give Protocatechuic acid (1) (1 mg). Fraction F₁₆ (113.7 mg) (CHCl₃/MeOH, 94:6), was submitted to preparative plates of silica gel (CHCl₃/MeOH, 7:1) to give cis-tiliroside (1.7 mg). Fraction F₁₇ (930.6 mg) (CHCl₃/MeOH, 93:7), was subjected to preparative plates of silica gel (CHCl₃/MeOH, 2:0.5) and purified on analytical plates of silica gel GF₂₅₄ (AcOEt/MeOH/H₂O, 6:1:1) to give trans-tiliroside (80 mg) and astragalin (3 mg).

A part of the n-butanol extract (16 g) was dissolved in 15 mL of MeOH and subjected to a column chromatography of silica gel (60–200 mesh, 160 g) eluted with CHCl₃/MeOH step gradients to yield 41 fractions (F₁–F₄₁) obtained by combining the eluates on the basis of TLC analysis. Fraction F₁₂ (57.8 mg) (CHCl₃/MeOH, 96:4), was submitted to preparative plates of silica gel (CHCl₃/MeOH, 12:1) to give Protocatechuic acid (1) (1 mg). Fraction F₁₆ (113.7 mg) (CHCl₃/MeOH, 94:6), was submitted to preparative plates of silica gel (CHCl₃/MeOH, 7:1) to give cis-tiliroside (1.7 mg). Fraction F₁₇ (930.6 mg) (CHCl₃/MeOH, 93:7), was subjected to preparative plates of silica gel (CHCl₃/MeOH, 2:0.5) and purified on analytical plates of silica gel GF₂₅₄ (AcOEt/MeOH/H₂O, 6:1:1) to give trans-tiliroside (80 mg) and astragalin (3 mg).

3.4. Solvents and Chemicals

Solvents: chloroform, ethyl acetate, formic acid and methanol reagent grade were purchased from VWR (Fontenay-sous-bois, France); acetonitrile HPLC grade was purchased from fisher scientific; Milli-Q water (18.2 MΩ) was generated by Millipore synergy system (Molsheim, France).

Chemicals: 2,2′-azino-bis(3-ethylbenzthiazoline-6-sulfonic acid) diammonium salt (ABTS⁺⁺), (C₁₅H₂₄N₆O₆S₄) was purchased from Biochimica Applilchem (Darmstadt, Germany); 2,2′-azobis(2-methylpropionamidine) dihydrochloride (AAPH), (C₅H₁₆N₆H₂Cl); (+)-6-hydroxy-2,5,7,8-tetramethylchromane-2-carboxylic acid (trolox), (C₁₄H₁₉O₃); fluorescein (C₂₀H₂₄O₅), were purchased from Sigma-Aldrich (Steinheim, Germany); sodium chloride was purchased from VWR; potassium chloride and potassium persulfate were purchased from ProLabo (Paris, France); potassium dihydrogen
phosphate, disodium hydrogen phosphate and disodium dihydrogen phosphate were purchased from Merck (Darmstadt, Germany).

3.5. On-Line HPLC-ABTS•⁺ Assay

The ABTS•⁺ assay was based on the procedure described by Re (1999) [50] and Siddhuraju (2006) [51]. ABTS (7 mM) was dissolved in 20 mL of Milli-Q water, to which potassium persulfate (2.5 mM) was added, generating the radical cation ABTS•⁺ overnight. The solution was left overnight at 4 °C protected from light exposure. This solution was used within 4 days, dilutes in the Phosphate Buffer Saline (PBS) solution (pH 7.4) in order to reach an absorbance of 1.2 at 412 nm. Phosphate Buffer Saline (PBS) was prepared by dissolving in Milli-Q water, 80 g NaCl, 14.4 g Na₂HPO₄, 2.4 g KH₂PO₄ and 2 g KCl; the volume was completed with Milli-Q water to 1L. The pH was adjusted to 7.4 using NaOH 0.1 mol/L. The radical cation ABTS•⁺ solution (10 mL) was diluted in PBS (50 mL) and completed to 500 mL with Milli-Q water before use. The diode array detector (DAD) was connected to a mixing tee followed by a reaction coil (Peek, 20 m × 0.25 mm) loaded in a temperature controlled oven. Post-column reaction is operated by delivering (0.5 mL/min) the ABTS•⁺ reagent with an Ultimate 3000 variable wavelength detector through the mixing tee. After the reaction coil, the flow pass through a second molecular absorption photometric detector set at 412 nm to detect the reduced form of ABTS•⁺ radical and thus a reduced absorbancy. The result is presented as a double chromatogram, the upper part representing the phenolic compounds, detected by their absorbancy at 280 nm, while the lower part representing the free radical scavenging activity of these phenolic compounds. A negative peak indicates that a compound having radical scavenging activity elutes out of the chromatographic column and react with the ABTS•⁺ radical cation. The area of the chromatographic negative peak gives an indication on the radical-scavenging activity of the considered compound. The column used in the separation of EtOAc and n-BuOH extracts, was a Kromasil C₁₈ with a 5 µm particle size, 4.60 mm × 250 mm (column temperature: 25 °C). The mobile phase delivered at 1 mL/min, was composed of 0.1% formic acid in H₂O milli-Q (solvent A) and acetonitrile containing 1% formic acid (solvent B). Gradient was as follow: 0 min, 10% B; 10 min, 20% B; 20 min, 20% B; 50 min, 50% B; 55 min, 50% B; 56 min, 80% B; 66 min, 80% B; 67 min, 10% B, maintained during 13 min. Each phenolic compound was injected into the LC-ABTS•⁺ and quantified by reference to its appropriate authentic standard by absorption at 280 nm, whereas the antioxidant potential was calculated as the concentration of trolox required to produce an equivalent negative peak area by absorption at 412 nm and expressed as trolox equivalent antioxidant capacity (TEAC) or µMol TE/mg.

3.6. Oxygen Radical Absorbance Capacity (ORAC)

The ORAC assay, developed and validated by Ou et al. (2001) [52], was performed as described by Davalos (2004) [53] with minor modification Volden (2008) [54]. The assay measures the oxidative degradation of fluorescein by peroxyl radicals initiated by 2′,2-azobis(2-methylpropionamidine) dihydrochloride (AAPH) at 37 °C. Free radical scavenging molecules protect fluorescein from the oxidative degradation and until exhaustion, slow reduction of the fluorescence signal by inducing latency. The area under the curve of the kinetics of fluorescence is directly proportional to the amount and effectiveness of the free radical scavengers present in a sample. The results are therefore expressed as trolox equivalent (µMolTE/mg) of dry extract. The products are dissolved in a mixture of water/methanol (70/30) at 1 mg/mL (1000 ppm), and then have to be diluted with water (between 25 and 500 ppm) before being placed in triplicate in 96 wells micro-plate up to 10 µL/well. A trolox standard range between 25 and 500 µMol/L was also filed in triplicate. An aqueous solution of 150 µL fluorescein (8.5 × 10⁻⁴ mol/L) was added per well. An automatic dispenser then permits the initiation of the reaction by the addition of AAPH (30 µL, 153 µMol/L) to each well from the initiation of the generation of radicals by the addition of AAPH, the intensity of fluorescence emitted is measured every 5 min for 2 h with a wavelength of excitation between 400 and 600 nm.
4. Conclusions

The present study allowed the isolation, structural elucidation and antioxidant evaluation of phenolics and flavonoids from *Helianthemum ruficomum*, an endemic Saharan species on which no report is available so far. In this work, 14 compounds were isolated and identified from the ethyl acetate and n-butanol soluble parts of the aqueous EtOH extract, five phenolics: protocatechuic acid (1), picein (7), vanillic acid 4-O-β-D-glucopyranoside (8), lavandoside (9), 4-hydroxybenzoic acid 4-O-β-D-glucopyranoside (10); seven flavonoid glycosides: trans-tiliroside (2), slightly contaminated by its stereoisomer cis-tiliroside, cis-tiliroside (3) contaminated by trans-tiliroside, astragalin (4), nicotiflorin (11), rutin (12), vicenin-2 (13), narcissin (14); and a mixture (71–29%) of stigmastanol (5) and β-sitostanol (6) respectively. All the compounds were identified by spectral analysis, mainly ESI-HRMS, UV and NMR experiments (1H, 13C, DEPT, DOSY, COSY, NOESY, HSQC and HMBC) and comparison of their spectroscopic data with those reported in the literature. Compounds 5, 7, 8, 9, 10 and 14 were new for the genus *Helianthemum*. The investigated extracts and isolated compounds were evaluated for their free radical scavenging capacity by on-line HPLC-ABTS** screening. The antioxidant properties were confirmed by ORAC and TEAC assays. The results clearly indicated high antioxidant potential of the extracts and tested compounds of this species and agreed with literature data that free radical scavenging activity depends on the molecular structure, the number and position of the hydroxyl groups of tested compounds. Moreover, given the large amounts isolated and purified in this work, of trans-tiliroside and rutin which besides its numerous recognized biological activities, is used as oral complement; it becomes important to note that this *Helianthemum* species might be developed industrially for its rich content of these bioactive components. For this reason, this plant could be a good candidate for culture as a crop.

Supplementary Materials: 1H-NMR, 13C-NMR, DEPT, COSY, HSQC, HMBC, NOESY, and MS spectra are available as supplementary materials. The following are available online at: http://www.mdpi.com/1420-3049/22/2/239/s1.

Acknowledgments: This work was carried out with the support of “Programme algéro-français de bourses en doctorat PROFAS B+” and by the General Directorate for Scientific Research and Technological Development (DGRSDT), Ministry of Higher Education and Scientific Research (MESRS), Algeria.

Author Contributions: S.B., E.M. and F.B. conceived and designed the experiments; S.B. chose and collected the plant material; Y.C. performed the experiments; F.B., E.M., S.B., P.M., M.Z. and Y.C. analyzed the data; E.M. contributed with reagents, materials, and analysis tools; F.B. wrote the paper. All authors read, approved and revised the final manuscript.

Conflicts of Interest: The authors declare no conflict of interest.
