Two-loop Yang-Mills theory in
the world-line formalism
and an Euler-Heisenberg type action

Abstract
Within the framework of the world-line formalism we write down in detail a two-loop Euler-Heisenberg type action for gluon loops in Yang-Mills theory and discuss its divergence structure. We exactly perform all the world-line moduli integrals at two loops by inserting a mass parameter, and then extract divergent coefficients to be renormalized.

1 Introduction

The Bern-Kosower method is described as a set of simple rules to obtain gluon scattering amplitudes at one loop, and it is known to improve the computational efficiency over the current Feynman diagram technique [1]. Those rules are derived from a string theory in the limit where the inverse string tension vanishes, as a consequence of the idea that a string world-sheet degenerates into a desired particle diagram at a singular point on the boundary of moduli space [2]-[4]. The integration over moduli space naturally covers all necessary Feynman diagrams appearing in field theory, and we hence have a compact master formula for particle scattering amplitudes. Thus the most conspicuous point in this formalism is that the diagram summation is already finished in the formula without introducing the loop integral and the Dirac trace for a given scattering [5, 6]. This idea is also applied to graviton scattering [7].

The discovery of the Bern-Kosower rules has also stimulated investigations for a new mathematical structure of quantum field theory; how to reflect the string-like structure into field theory as such. The first rederivation of the Bern-Kosower rules was accomplished by Strassler in Ref. [8], where the background field method, the proper time method and the path integral method for a first quantized 0 + 1 dimensional field theory (world-line formulation) are well combined [8]. There are many other fruitful examples along this stream [9] (see Section 1 of Ref. [10] for updated references), and these examples are the strong incentives to study the world-line formalism from the theoretical point of view, especially from the viewpoint of its higher loop extensions [11]. The present paper also discusses two-loop Yang-Mills theory in the world-line formalism with the aim to develop techniques for higher loops.

This paper is a continuation of the previous work [11], where the effective action of Yang-Mills theory at the two-loop order is derived based on the world-line formalism; also developed there is a certain technique, which generates multiloop generalizations of the one-loop Trace-log (determinant) formula. However, these arguments are still inside the shell of formal arguments, since we are left with the problem of how to deal with the multi-integrals of world-line moduli parameters. The moduli integrals of a higher genus world-sheet are too complicated to perform, while one might naturally expect that this situation would be improved in the field theory limit. Although we, of course, have an option to computerize these complicated integrals, there are still difficulties, for example in three loop QED integrals [12].

It is certainly valuable to analyze two-loop integrals of Yang-Mills theory in the world-line
formalism in particular if many outer particles or an Euler-Heisenberg type constant field are involved. It might also hint to the world-line moduli integrations at higher loop orders.

In this paper, after a detailed derivation of the two-loop Euler-Heisenberg action with gluon loops in a pseudo-abelian gauge field background, we shall present some technical issues of how to deal with the world-line moduli integrals in the gluon effective action at the second order of the Taylor expansion in terms of external background fields. This analysis is also essential to examine the divergence structure related to a wave function and gauge fixing parameter renormalization. We only discuss the gluon loop part, since the ghost loop part is rather simple and can be dealt with in the same way as the gluon loop case.

When we perform the integrals, we insert a mass parameter in order to regularize divergences. Generally speaking, massive propagators in the Feynman rule method are difficult to integrate in an analytic way. Contrastingly in our formalism, we shall go through the entire procedure analytically, and all the results will be written in hypergeometric functions. This is certainly an intriguing point of this paper.

This paper is organized as follows. In Section 2, we write down our starting formulae for the gluon loop effective action at two loops. We slightly modify a few notations from the previous presentation [11] through the path and proper time inversions presented in Appendix A. In Section 3, a derivation of the one-loop $\beta$-function coefficient serves as an example for how calculations in our formalism can be simplified by specializing to the pseudo-abelian case. In Section 4, we apply the pseudo-abelian technique to the calculation of the gluon effective action presented in Section 2. Here, we only perform the world-line path integral parts. This Section is a completion of the parts outlined in the previous paper [11], and the details of the computation are contained in Appendix B. In Section 5, we further study how to integrate the world-line moduli integral parts, which are the final integrations to obtain a fully integrated form of Euler-Heisenberg type action. For simplicity, we only consider the gluon kinetic term, through the Taylor expansions concerning the external field strength. The Taylor coefficients are the functions of world-line moduli parameters, and we show that these coefficients can be integrated; the details are in Appendices C and D. Appendix E is the Feynman diagram analysis to be compared with our results.

2 Two-loop effective action

Let us first review in brief the world-line representation of the two-loop effective action in
Yang-Mills theory \([11]\). In this paper we only discuss the gluon loop part. It is given by

\[ \Gamma[A] = I_1[A] + I_2[A] , \tag{2.1} \]

where \((I_1 = \Gamma_1 + \Gamma_2, I_2 = \Gamma_3^{(2)}\) in the previous paper)

\[
I_1[A] = -\frac{1}{8} \int_0^\infty \int_0^\infty \int_0^\infty \int_0^\infty \int \left[\frac{dS}{S} \left[ \frac{d\tau}{\tau} \int \mathcal{D}x_{T_1} \int \mathcal{D}x_{T_2} \delta^4(x_{T_1} - x_{T_2}) \right. \right.
\times \left[ (\dot{w}_\mu(0) - \dot{x}_\mu(0)) \dot{w}_\rho(T_3) W_{\mu[\sigma \rho][\mu]}^{ae}[x; S, \tau_\alpha, 0]
+ \dot{x}_\mu(0) \dot{w}_\rho(T_3) W_{\mu[\sigma \rho][\mu]}^{ae}[x; S, \tau_\alpha, 0] \right] W_{\sigma \nu}^{ae}[w; T_3, 0] \bigg] , \tag{2.2}
\]

and

\[
I_2[A] = \frac{1}{4} \int_0^\infty \int \mathcal{D}x_{T_1} |T_1| \int \mathcal{D}x_{T_2} |T_2| \delta^4(x_{T_1} - x_{T_2}) \times \text{Tr}_C \left[ \lambda^a W_{\mu \nu}[x_1; T_1, 0] \right] \text{Tr}_C \left[ \lambda^a W_{\nu \mu}[x_2; T_2, 0] \right] , \tag{2.3}
\]

with the following compact notations:

\[
\int \mathcal{D}x_T F[x] = \int \mathcal{D}x e^{-\frac{1}{4} \int_0^T d\tau x^2} F[x] \quad \text{for any functional } F[x] , \tag{2.4}
\]

\[
W_{\sigma \nu}^{ea}[w; T_3, 0] = P \exp \left\{ \int_0^{T_3} d\tau M_{T}[w] \right\}_{\sigma \nu}^{ea} , \tag{2.5}
\]

\[
W_{\mu \sigma \rho \nu}^{ae}[x; S, \tau_\alpha, 0] = \text{Tr}_C \left[ \lambda^a \mathcal{P} \exp \left\{ \int_{\tau_\alpha}^{S} d\tau M_{T}[x] \right\}_{\mu \sigma} \lambda^c \mathcal{P} \exp \left\{ \int_0^{\tau_\alpha} d\tau M_{T}[x] \right\}_{\rho \nu} \right] , \tag{2.6}
\]

and

\[
(M_{T}[x])_{\mu \nu}^{ab} = 2i \left[ F_{\mu \nu}^{c}(x(\tau')) - \frac{1}{2} \delta_{\mu \nu} A_{c}(x(\tau')) \cdot \partial_{\tau'} x^{a}(\tau') \right]_{\tau' = \tau} (\lambda^c)^{ab} . \tag{2.7}
\]

Here we have slightly changed the notations used in the previous paper \([11]\); (i) the previous definition of \(M\) is associated with \(D = \partial - iA\), while the present \(M_{T}\) is associated with \(D = \partial + iA\), (ii) the path ordering directions are modified to be the standard one, and some related formulae are listed in Appendix A. As in the previous paper, we always use Euclidean space-time conventions.
It is convenient to have another representation for $I_1[A]$, based on the symmetric parametrization in Figure 1(b), which treats the individual gluon lines in a more equal way, thus allowing a greater class of transformations by inverting and relabelling the gluon paths and leading to significant simplifications in the concrete calculations. The expression (2.2) is based on the loop type parametrization in Figure 1(a). The transformation rules between (a) and (b) are known [12, 14], and we thus have the following symmetric representation for $I_1[A]$:

$$I_1[A] = -\frac{1}{8} \int_0^\infty dT_1 dT_2 dT_3 \int d^D y_1 \int d^D y_2 \left[ \prod_{k=1}^3 \int_{x_k(0)=y_1}^{x_k(T_k)=y_2} [Dx_k] \right]$$

$$\times \left[ (\dot{x}_{3\mu}(0) - \dot{x}_{1\mu}(0)) \dot{x}_{3\rho}(T_3) \tilde{W}^{ae}_{\mu[\sigma\rho][\nu]}[x_2^{-1}, x_1; T_2, 0, T_1, 0] + \dot{x}_{1\nu}(0) \dot{x}_{3\rho}(T_3) \tilde{W}^{ae}_{\mu[\sigma\rho][\mu]}[x_2^{-1}, x_1; T_2, 0, T_1, 0] \right] W^{ac}_{\sigma\nu}[x_3; T_3, 0],$$  

where

$$T_1 = \tau_\alpha, \quad T_2 = S - \tau_\alpha,$$

and

$$\tilde{W}^{ae}_{\mu[\sigma\rho][\nu]}[x_2^{-1}, x_1; T_2, 0, T_1, 0] = \text{Tr}_C \left[ \lambda^a \text{P exp} \left\{ \int_0^{T_2} d\tau M_{\tau} [x_2^{-1}] \right\} \right] \lambda^c \text{P exp} \left\{ \int_0^{T_1} d\tau M_{\tau} [x_1] \right\}.$$  

Note that the transition from loop type to symmetric parametrization requires both splitting the loop path into two parts and inverting one of them (which we denote by $x_2^{-1}$) to achieve all three paths to start at $y_1$ and to end at $y_2$. In contrast to the naive expectation, this suggests that in a general background, one may not just write down the product of three propagators starting...
and ending at identical points to represent a loop with inserted propagator. See Appendix A for a
detailed definition of the notation $x_2^{-1}$ and some comments on path inversion

After finishing the next section, we shall discuss the world-line path integrals for $x_k$ in Section 4,
and the integrals of the world-line moduli parts (proper times) $T_k$ in Section 5.

3 The pseudo-abelian case

For the rest of this paper, we confine ourselves to the pseudo-abelian su(2) with constant field
strength. Thus we assume

$$A_\mu^a(x) = A_\mu(x) n^a \quad \text{with} \quad n^a n^a = 1 \quad \text{and constant } n,$$

(3.1)
i.e. the color dependence of the non-abelian gauge fields is supposed to be factored out in form of a
constant unit vector in color space. Within these settings calculations are simplified considerably,
though non-abelian results can still be reproduced as shall be seen below. As an example and
to introduce some notations, we here show a brief sketch of how our formalism works within the
calculation of one-loop $\beta$-function coefficients.

The assumption (3.1) leads to similar decompositions for the field strength

$$F_{\mu\nu}^a(x) = F_{\mu\nu}(x) n^a \quad \text{with} \quad F_{\mu\nu}(x) = \partial_\mu A_\nu(x) - \partial_\nu A_\mu(x),$$

(3.2)
and the matrix $M_r[x]$

$$M_r[x] = M_r[x] \otimes (n^c \lambda^c) \equiv M_r[x] \otimes T_{-},$$

(3.3)
where $M_r[x]$ is the Lorentz matrix defined by

$$M_r[x] = 2i \left[ F(x) - \frac{1}{2} A_\rho(x) \dot{x}_\rho 1_L \right],$$

(3.4)
and $1_L$ denotes the unit Lorentz matrix (in the Euclidean space).

So far we have not used our additional assumption of a constant field strength, nor have we
fixed the gauge for the external gauge fields $A_\mu^a$. If we take into account the constancy of the field
strength, we may choose

$$A_\mu(x) = \frac{1}{2} x_\nu F_{\nu\mu},$$

(3.5)
henceforth expecting $M_r[x]$ to be of the form

$$M_r[x] = 2i \left[ F - \frac{1}{4} x_\sigma F_{\sigma\rho} \dot{x}_\rho 1_L \right],$$

(3.6)
rather than (3.4). In addition, it is convenient to define the integrated matrices (omitting the index \(\tau\)), and we can simply write
\[
\int_0^T M_\tau[x] d\tau = M[x] \otimes T_- \quad \text{with} \quad M[x] = \int_0^T \mathcal{M}_\tau[x] d\tau .
\] (3.7)

It is the benefit of confining ourselves to the pseudo-abelian case, that the \(M_\tau[x]\) matrices for different values of the parameter \(\tau\) become commuting quantities
\[
[M_\tau[x], M_\tau'[x]] = 0 .
\] (3.8)

Thus we are allowed to drop path ordering from all of our expressions. This leads to the following decomposition
\[
P \exp \{ \mathcal{M} \otimes T_- \} = 1_L \otimes I + \sinh \{ \mathcal{M} \} \otimes T_- + \cosh \{ \mathcal{M} \} \otimes T_+ ,
\] (3.9)
in terms of the \(su(2)\) matrices
\[
T_- = n^c \lambda^c , \quad T_+ = (T_-)^2 , \quad I = 1_C - T_+ , \quad \text{where} \quad 1_C = \text{diag}(1,1,1) .
\] (3.10)

Now, using the properties
\[
\text{Tr}_C T_- = 0 , \quad C_A \equiv \text{Tr}_C T_+ = 2 , \quad \text{Tr}_C I = 1
\] (3.11)
the one-loop effective action for the gluon loop is calculated as follows [15]:
\[
\Gamma_G^{1\text{-loop}}[A] = -\frac{1}{2} \int_0^\infty \frac{dT}{T} e^{-m^2 T} \int [Dx]_T \left( P \exp \left( \int_0^T M_\tau[x] d\tau \right) \right)_{\mu\mu}^{\alpha\alpha} \\
= -\frac{1}{2} \int_0^\infty \frac{dT}{T} e^{-m^2 T} \int [Dx]_T \left( D + C_A \text{Tr}_L (\cosh \mathcal{M}) \right) \\
= -\frac{1}{4} \int_0^\infty \frac{dT}{T} e^{-m^2 T} \int [Dx]_T \left( D + C_A \text{Tr}_L (e^\mathcal{M}) \right) + (\mathcal{F} \to -\mathcal{F}) ,
\] (3.12)
where we have introduced the gluon mass term \(e^{-m^2 T}\) for regularization. The second contribution with \(\mathcal{F}\) replaced by \(-\mathcal{F}\) counts for a factor of two, thus with the one-loop path integral normalization
\[
\int [Dx] \exp \left\{-\frac{1}{4} \int_0^T d\tau \left[ x^2 + 2ix\mathcal{F}\dot{x} \right] \right\} = (4\pi T)^{-D/2} \text{det}_L^{-1/2} \left( \frac{\sin FT}{FT} \right) \int d^D x_0 
\] (3.13)
we are led to
\[
\Gamma_{G}^{1-\text{loop}}[A] = -\frac{1}{2(4\pi)^{D/2}} \int_{0}^{\infty} dT T^{-1-D/2} e^{-m^2 T} \left[ D + C_A \text{Tr}_L(e^{2iFT}) \text{det}_{L}^{-1/2} \left( \frac{\sin FT}{FT} \right) \right] \int d^D x_0 . 
\] (3.14)

For now we are interested in the two-point function only, i.e. in the second functional derivative of the effective action with respect to \( A^a_\mu \). To this end, we only need the second order term of an expansion of (3.14) in terms of \( F \). Omitting constant and higher order terms we find
\[
\Gamma_{G}^{1-\text{loop}}[A] = \cdots - \frac{C_A}{2(4\pi)^{D/2}} \left( \frac{D}{12} - 2 \right) \int_{0}^{\infty} dT T^{-1-D/2} e^{-m^2 T} \int d^D x_0 \text{Tr}_L F^2 + \cdots . 
\] (3.15)

Setting \( D = 4 - 2\varepsilon \) and performing the \( T \) integration leads to the following pole structure in \( \varepsilon \):
\[
\Gamma_{G}^{1-\text{loop}}[A] = \cdots - \frac{g_0^2 C_A}{(4\pi)^2} \left( \frac{-10}{3\varepsilon} \right) \int d^D x_0 \left( -\frac{1}{4} F_{\mu\nu} F_{\mu\nu} \right) + O(\varepsilon^0) + \cdots , 
\] (3.16)
where we have revived the gauge coupling \( g \) and where \( g_0 \) is the dimensionless coupling constant defined by \( g = g_0 \mu^{\varepsilon} \).

Finally we calculate the functional derivative and transform into momentum space: using
\[
\int d^D x_0 \left( -\frac{1}{4} F_{\rho\sigma} F_{\rho\sigma} \right) \longrightarrow -\delta^{ab} (\delta_{\mu\nu} k^2 - k_{\mu} k_{\nu}) 
\] (3.17)
we read off
\[
\Pi_{G^{ab}}^{\mu\nu} = -\frac{g_0^2 C_A}{(4\pi)^2} \left( \frac{-10}{3\varepsilon} \right) \left( \delta_{\mu\nu} k^2 - k_{\mu} k_{\nu} \right) + O(\varepsilon^0) . 
\] (3.18)

Similarly, the one-loop contribution from a ghost loop can be calculated: As can be deduced from Ref. [1], the ghost one-loop action is given by changing the overall normalization in (3.12) from \( 1/2 \) to \(-1\), and only employing the Lorentz scalar term in (2.7); i.e., define \(-iA^c_\mu \dot{x}_\mu \chi^c \equiv \tilde{M}_\tau \) instead of using \( M_\tau \). The corresponding pseudo-abelian quantity \( \tilde{M} \) is defined analogically to the gluon loop case (q.v. Eqs. (3.6) and (3.7)). Thus we find the one-loop ghost action
\[
\Gamma_{FP}^{1-\text{loop}}[A] = \frac{1}{2(4\pi)^{D/2}} \int_{0}^{\infty} dT T^{-1-D/2} e^{-m^2 T} \left[ D + C_A \text{det}_{L}^{-1/2} \left( \frac{\sin FT}{FT} \right) \right] \int d^D x_0 . 
\] (3.19)

Again taking into account the \(-F\) term by a factor of two and using (3.13), we arrive at
\[
\Gamma_{FP}^{1-\text{loop}}[A] = \frac{1}{(4\pi)^{D/2}} \int_{0}^{\infty} dT T^{-1-D/2} e^{-m^2 T} \left[ 1 + C_A \text{det}_{L}^{-1/2} \left( \frac{\sin FT}{FT} \right) \right] \int d^D x_0 . 
\] (3.20)
Expanding this expression in the same way as done in (3.15), we derive
\[
\Gamma^{1-loop}_{FP}[A] = \cdots + \frac{C_A}{12(4\pi)^{D/2}} \int_0^\infty dT T^{1-D/2} e^{-m^2 T} \int d^D x_0 \text{Tr}_L F^2 + \cdots
\] (3.21)
\[
= \cdots - \frac{g_0^2 C_A}{(4\pi)^2} \left( -\frac{1}{3\varepsilon} \right) \int d^D x_0 \left( -\frac{1}{4} F_{\mu\nu} F_{\mu\nu} \right) + \mathcal{O}(\varepsilon^0) + \cdots ,
\] (3.22)
and hence
\[
\Pi_{FP}^{ab\mu\nu} = -\frac{g_0^2 C_A}{(4\pi)^2} \delta^{ab} \left( -\frac{1}{3\varepsilon} \right) \left( \delta_{\mu\nu} k^2 - k_\mu k_\nu \right) + \mathcal{O}(\varepsilon^0) .
\] (3.23)
Gathering Eqs. (3.18) and (3.23), the correct (one-loop) \(\beta\)-function coefficient \(11/3\) is reproduced.

### 4 Two-loop Euler-Heisenberg formulas

Now, let us consider the extension of the above calculations to the two-loop case. We deal with the symmetric representations (2.3) and (2.8). In the two-loop case, as understood from (2.7), we have to keep in mind that the sign of the \(x F \dot{x}\) term changes due to the \(\tau\) derivative, if we invert the path. For example in (2.10), one should notice (see also Appendix A) that
\[
(M_T[x^2])^{ab}_{\mu\nu} = 2i \left[ F^{ac}_{\mu \nu}(x^2) + \frac{1}{2} \delta_{\mu\nu} A^c_{\rho}(x^2) \cdot \partial_{\sigma x^2(\tau')} \right]_{\tau' = T} (\lambda^c)^{ab}
= 2i \left[ F^{ac}_{\mu \nu}(x^2(\tau')) + \frac{1}{2} \delta_{\mu\nu} A^c_{\rho}(x^2(\tau')) \cdot \partial_{\sigma^a x^2(\tau')} \right]_{\tau' = T'} (\lambda^c)^{ab}
= \left( M_{T_2 - \tau}[x^2] \right)^{ba}_{\nu\mu} .
\] (4.1)
Reflecting this fact, it is rather convenient to introduce the signature index \(\kappa = \pm 1, 0\) on the Lorentz matrix \(\mathcal{M}\) :
\[
\mathcal{M}^{(\kappa)}_{k} \overset{\text{def.}}{=} \int_0^T d\tau 2i \left[ [\kappa |F - \frac{1}{4} \kappa x_{k\sigma} F_{\sigma\rho} \dot{x}_{\rho} 1_L] \right],
\] (4.2)
where the \(k\) stands for the line labels 1, 2 and 3. With this matrix notation (4.2), the general form for the color matrix part of the action (2.8) is written in the form
\[
\tilde{W}^{(\kappa)}_{\alpha\rho} \left[ x^1, x_1; T_2, 0, T_1, 0 \right] W^{(\kappa)}_{\sigma\nu} [x_3; T_3, 0]
= \text{Tr}_C \left[ \lambda^a \exp \left\{ \mathcal{M}^{(-)}_{2} \otimes \mathcal{T}_- \right\} \gamma^\delta \lambda^e \exp \left\{ \mathcal{M}^{(+)}_{1} \otimes \mathcal{T}_+ \right\} \exp \left\{ \mathcal{M}^{(+)}_{3} \otimes \mathcal{T}_+ \right\} \right]_{\alpha\beta} .
\] (4.3)
After using the expansion (cf. Eq. (3.9))
\[
\exp \left\{ \mathcal{M}^{(\kappa)}_{k} \otimes \mathcal{T}_- \right\} = 1_L \otimes \mathcal{T} + \sinh \left\{ \mathcal{M}^{(\kappa)}_{k} \right\} \otimes \mathcal{T}_- + \cosh \left\{ \mathcal{M}^{(\kappa)}_{k} \right\} \otimes \mathcal{T}_+ ,
\] (4.4)
we perform the color traces applying the following formulae:

\[ \text{Tr}_C (\lambda^a T_\pm \lambda^c T_\pm) I^a = 2 \]
\[ \text{Tr}_C (\lambda^a T_\pm \lambda^c I) T_\pm = 2 \]  \hspace{1cm} (4.5)  
\[ \text{Tr}_C (\lambda^a I \lambda^c T_\pm) T_\pm = \pm 2 , \]

where the 3rd formula follows from the 2nd one with the properties

\[(T_\pm)^T = \pm T_\pm, \quad I^T = I . \]  \hspace{1cm} (4.6)

For any other combinations of \( A, B \) and \( C \) chosen out of \( \{I, T_-, T_+\} \), the following formula applies

\[ \text{Tr}_C (\lambda^a A \lambda^c B) C^a = 0 . \]  \hspace{1cm} (4.7)

Thus the quantity (4.3) is calculated as follows:

\[
\tilde{W}_{\gamma \delta \alpha \beta} [x_2^{-1}, x_1; T_2, 0, T_1, 0] W_{\sigma \nu}^a [x_3; T_3, 0]
\]
\[ = 2 \delta_{\alpha \beta} \left[ \cosh \left\{ M_2^{(-)} \right\}_{\gamma \delta} \cosh \left\{ M_3^{(+)} \right\}_{\sigma \nu} + \sinh \left\{ M_2^{(-)} \right\}_{\gamma \delta} \sinh \left\{ M_3^{(+)} \right\}_{\sigma \nu} \right] + 2 \delta_{\gamma \delta} \left[ \sinh \left\{ M_1^{(+)} \right\}_{\sigma \nu} \sinh \left\{ M_2^{(-)} \right\}_{\gamma \delta} - \cosh \left\{ M_1^{(+)} \right\}_{\sigma \nu} \sinh \left\{ M_2^{(-)} \right\}_{\gamma \delta} \right] 
+ 2 \delta_{\sigma \nu} \left[ \sinh \left\{ M_1^{(+)} \right\}_{\alpha \beta} \cosh \left\{ M_2^{(-)} \right\}_{\gamma \delta} + \sinh \left\{ M_1^{(+)} \right\}_{\alpha \beta} \sinh \left\{ M_2^{(-)} \right\}_{\gamma \delta} \right] \]  \hspace{1cm} (4.8)
\[ = \exp \left\{ M_1^{(0)} \right\}_{\alpha \beta} \exp \left\{ M_2^{(-)} \right\}_{\gamma \delta} \exp \left\{ M_3^{(+)} \right\}_{\sigma \nu} + \exp \left\{ M_1^{(+)} \right\}_{\alpha \beta} \exp \left\{ M_2^{(0)} \right\}_{\gamma \delta} \exp \left\{ - M_3^{(+)} \right\}_{\sigma \nu} \right] + \exp \left\{ M_1^{(+)} \right\}_{\alpha \beta} \exp \left\{ M_2^{(-)} \right\}_{\gamma \delta} \exp \left\{ M_3^{(0)} \right\}_{\sigma \nu} + (F \rightarrow -F) . \]  \hspace{1cm} (4.9)

Now, as sketched in Ref. [11], performing the trivial integral (the 1st term) in Eq.(4.2)

\[
\exp \left\{ \int_0^{T_k} d\tau \left( -\frac{1}{4} |\dot{x}_k|^2 \right) \right\} \exp \left\{ \pm M_k^{(\kappa)} \right\}_{\eta \xi} 
\]
\[ = \exp \left\{ \pm 2i |\kappa| T_k F \right\}_{\eta \xi} \exp \left\{ - \frac{1}{4} \int_0^{T_k} d\tau [\dot{x}_k^2 + 2i (\pm \kappa) x_k F_{\sigma \rho} \dot{x}_{k \rho}] \right\} , \]  \hspace{1cm} (4.10)

and introducing the quantities

\[ S(\kappa_1, \kappa_2, \kappa_3) = -\frac{1}{4} \sum_{k=1}^3 \int_0^{T_k} d\tau \left[ \dot{x}_k^2 + 2i \kappa_k x_k F_{\sigma \rho} \dot{x}_{k \rho} \right] , \quad (\kappa_a = \pm 1, 0) \]  \hspace{1cm} (4.11)
we have the following formula:

\[
\exp\left\{ -\frac{1}{4} \sum_{k=1}^{3} \int_{0}^{T_k} dt \dot{x}_k^2 \right\} \tilde{W}^{\gamma e}_{\sigma \alpha \beta}[x_2^{-1}, x_1; T_2, 0, T_1, 0] W^{e a}_{\sigma \nu}[x_3; T_3, 0]
\]

\[
= \delta_{\alpha \beta} \exp\left\{ 2i T_2 F \right\}_{\gamma \delta} \exp\left\{ 2i T_3 F \right\}_{\sigma \nu} e^{S^{(0, -,-)}}
+ \delta_{\gamma \delta} \exp\left\{ 2i T_1 F \right\}_{\alpha \beta} \exp\left\{ 2i T_3 F \right\}_{\nu \sigma} e^{S^{(+,-,-)}},
+ \delta_{\sigma \nu} \exp\left\{ 2i T_1 F \right\}_{\alpha \beta} \exp\left\{ 2i T_2 F \right\}_{\gamma \delta} e^{S^{(+,-,-)}} + (F \rightarrow -F). \quad (4.12)
\]

It is worth noticing here that the interaction terms \(x_k F \dot{x}_k\) defined on the three different lines possess different \(\kappa\) values; this fact is related to the \(su(2)\) structure \(\varepsilon^{abc}\). In the following, we calculate \(I_1\) and \(I_2\) separately, since these two quantities involve different world-line topology.

### 4.1 The \(I_1[A]\) part

Applying the formula (4.12) to Eq. (2.8), we obtain the following expressions (For the convenience of presentation, we split \(I_1[A]\) into two quantities depending on whether \(x_1x_3\) or \(x_3x_3\) correlations.):

\[
I_1[A] = \Gamma_1[A] + \Gamma_2[A],
\]

where

\[
\Gamma_1[A] = -\frac{1}{8} \int_{0}^{\infty} dT_1 dT_2 dT_3 \int d^Dy_1 \int d^Dy_2 \sum_{k=1}^{3} \int_{x_k(0)=y_1}^{x_k(T_k)=y_2} D\tilde{x}_k \dot{x}_3(T_3)
\times \left\{ e^{2iT_2F} \left( e^{2iT_3F} - 1 \right)_L \text{Tr}_L \left( e^{2iT_3F} \right) \right\}_{\mu \rho} e^{S^{(0, -,-)}}
+ \left\{ e^{2iT_2F} \left( e^{-2iT_1F} - 1 \right)_L \text{Tr}_L \left( e^{-2iT_1F} \right) \right\}_{\mu \rho} e^{S^{(+,-,-)}}
+ \left\{ e^{-2i(T_1+T_3)F} - 1 \right)_L \text{Tr}_L \left( e^{-2i(T_1+T_3)F} \right) \right\}_{\mu \rho} e^{S^{(+,-,-)}} + (F \rightarrow -F), \quad (4.14)
\]

\[
\Gamma_2[A] = -\frac{1}{8} \int_{0}^{\infty} dT_1 dT_2 dT_3 \int d^Dy_1 \int d^Dy_2 \sum_{k=1}^{3} \int_{x_k(0)=y_1}^{x_k(T_k)=y_2} D\tilde{x}_k \dot{x}_3(T_3)
\times \left\{ -2i \sin(2F(T_2+T_3)) - e^{2iT_2F} \text{Tr}_L e^{2iT_3F} \right\}_{\mu \rho} e^{S^{(0, -,-)}}
+ \left\{ -2i \sin(2F(T_1+T_2)) - e^{2iT_2F} \text{Tr}_L e^{2iT_1F} \right\}_{\mu \rho} e^{S^{(+,-,-)}}
+ \left\{ -2 \cos(2F(T_1+T_3)) + e^{2iT_2F} \text{Tr}_L e^{2iT_1F} \right\}_{\mu \rho} e^{S^{(+,-,-)}} + (F \rightarrow -F). \quad (4.15)
\]
Then we perform the path integrals of the form

\[
<\dot{x}_a^\mu(\tau) \dot{x}_b^\nu(\tau')>_{(\kappa_1,\kappa_2,\kappa_3)} = \int \! d^Dy_1 \int \! d^Dy_2 \left[ \prod_{k=1}^3 \int \! Dx_k \right] \dot{x}_a^\mu(\tau) \dot{x}_b^\nu(\tau') e^{\mathcal{S}(\kappa_1,\kappa_2,\kappa_3)}, \tag{4.16}
\]

and this yields

\[
<\dot{x}_a^\mu(\tau) \dot{x}_b^\nu(\tau')>_{(\kappa_1,\kappa_2,\kappa_3)} = \mathcal{N}(\kappa_1,\kappa_2,\kappa_3) \partial_\tau \partial_{\tau'} G_{ab}^{\mu\nu}(\tau,\tau';\kappa_1,\kappa_2,\kappa_3), \tag{4.17}
\]

where

\[
\mathcal{N}(\kappa_1,\kappa_2,\kappa_3) = (4\pi)^{-D} \operatorname{det}_{L}^{-1/2} \left( \sum_{l=1}^3 \kappa_l \mathcal{F} \cot \kappa_l \mathcal{F} T_l \right) \prod_{k=1}^3 T_k^{-D/2} \operatorname{det}_{L}^{-1/2} \left( \frac{\sin \kappa_k \mathcal{F} T_k}{\kappa_k \mathcal{F} T_k} \right) \int \! d^Dx_0, \tag{4.18}
\]

and \(^1\)

\[
G_{ab}^{\mu\nu}(\tau,\tau';\kappa_1,\kappa_2,\kappa_3) = -\delta_{ab} G_{\mu\nu}^{\tau}(\tau,\tau') + 2 \left( \sum_{k=1}^3 \kappa_k \mathcal{F} \cot(\kappa_k \mathcal{F} T_k) \right)^{-1} \left( \frac{\partial T_{\mu\nu}^{\tau}}{\partial \mathcal{F} T_{\tau}} - \frac{1}{2} \right) \mu \nu \left( \frac{\partial T_{\mu\nu}^{\tau}}{\partial \mathcal{F} T_{\tau}} - \frac{1}{2} \right), \tag{4.19}
\]

with

\[
G_{\mu\nu}^{\tau}(\tau,\tau') = \begin{cases} 
\delta_{\mu\nu} G_{B}^{\tau}(\tau,\tau') = \delta_{\mu\nu} \left[ |\tau - \tau'| - \frac{(\tau - \tau')^2}{2 T_a} \right] & (\kappa_a = 0) \\
\left[ \frac{1}{2 \mathcal{F}^2} \left( \frac{\mathcal{F}}{\sin(\mathcal{F} T_a)} e^{-i \kappa_a \mathcal{F} T_a \partial_\tau \mathcal{G}^{\tau}_{B}(\tau,\tau')} + i \kappa_a \mathcal{F} \partial_\tau \mathcal{G}^{\tau}_{B}(\tau,\tau') - \frac{1}{T_a} \right) \right] & (\kappa_a \neq 0) \end{cases} \tag{4.20}
\]

Inserting each value of (4.17) at \((\tau,\tau') = (0,T_3)\) into Eqs. (4.14) and (4.15), we therefore obtain (the details are presented in Appendix B)

\[
I_1[A] = -\frac{1}{2} (4\pi)^{-D} \int_0^\infty \! dT_1 dT_2 dT_3 \operatorname{det}_{L}^{1/2} \left( \frac{\mathcal{F}^2}{\Delta_{\mathcal{F}}} \right) \left\{ \right.
\]

\[
\operatorname{Tr}_L \left( \frac{\mathcal{F}^2 T_3}{\Delta_{\mathcal{F}} \sin \mathcal{F} T_2} \left[ 2 \sin \mathcal{F} T_1 \cos \mathcal{F} \left( T_1 + 2 T_2 \right) - 2 \sin \mathcal{F} (T_1 + 2 T_2) \cos \mathcal{F} (2 T_1 + 3 T_2) \right. \right.
\]

\[
+ \{ 1 - 2 \cos \mathcal{F} (T_1 + T_2) \} \sin \mathcal{F} T_2 \cos \mathcal{F} (T_1 - T_2) \right)
\]

\[
+ \frac{\mathcal{F}}{\Delta_{\mathcal{F}}} \left[ 4 \sin \mathcal{F} T_1 \sin \mathcal{F} T_2 \sin \mathcal{F} (T_1 + T_2) - 2 \sin \mathcal{F} T_1 \cos \mathcal{F} (2 T_1 + 3 T_2) \right.
\]

\[
- 2 \sin \mathcal{F} T_2 \cos \mathcal{F} (T_1 - 2 T_2) - \sin \mathcal{F} (T_1 + T_2) \cos \mathcal{F} (T_1 - T_2) \left. \right] \left. \right)
\]

\[
+ \operatorname{Tr}_L \left( \frac{\mathcal{F}^2 T_3}{\Delta_{\mathcal{F}} \sin \mathcal{F} T_2} \left[ \sin \mathcal{F} (T_1 + T_2) \cos \mathcal{F} (2 T_1 + T_2) - \sin \mathcal{F} T_1 \cos \mathcal{F} (T_1 + T_2) \right. \right.
\]

\[
\left. \right] \right\}
\]

\(^1\)In Eq. (4.19), one may replace \(G_{\mu\nu}^{\tau}(\tau,\tau') \rightarrow G_{\mu\nu}^{\tau}(\tau,\tau') - G_{\mu\nu}^{\tau}(\tau,0) - G_{\mu\nu}^{\tau}(0,\tau')\) as seen in \([1]\), however our final results do not change because we only need the derivatives \(\partial_\tau \partial_{\tau'} G_{ab}^{\mu\nu}\).
\[
+ \frac{F}{\Delta F} \left[ 3 \sin FT_1 \cos F(T_1 + T_2) + \cos 2FT_1 \sin F(T_1 + T_2) \right] \cdot \text{Tr}_L \left( \cos 2F T_2 \right) \\
+ \text{Tr}_L \left( \frac{F^2 T_2}{\Delta F \sin FT_2} \left[ \sin FT_2 \cos (F T_1 - T_2) \cos FT_2 \sin (F T_1 + T_2) \right] \right) \\
- \sin FT_1 \cos 2FT_2 \right) + \frac{F}{\Delta F} \sin FT_1 \cos FT_2 \right) \cdot \text{Tr}_L \left( \cos 2F(T_1 + T_2) \right) \\
+ \delta(T_2) 2(1 - D) \text{Tr}_L \left( \cos 2FT_1 \right) + \delta(T_3) \text{Tr}_L \left( \cos 2F(T_1 - T_2) \right) \\
- \delta(T_3) \text{Tr}_L \left( \cos 2FT_1 \right) \cdot \text{Tr}_L \left( \cos 2F T_2 \right) \right) \right] \bigg\rangle dx_0 , (4.21)
\]

where
\[
\Delta_F = \sin FT_1 \sin FT_2 + FT_3 \sin F(T_1 + T_2) . (4.22)
\]

4.2 The \( I_2[A] \) part

The computation of the other quantity \( I_2[A] \) is similar to the above calculations, however the topology of the world-line diagram is different in this case. Let us start with the following expression.

First, Eq. (2.3) with (3.7) inserted becomes
\[
I_2[A] = \frac{1}{4} \int_0^\infty dT_1 dT_2 \oint [dx_1]_{T_1} \oint [dx_2]_{T_2} \delta(x_1(0) - x_2(0)) \\
\times \text{Tr}_C \left[ \lambda^a \exp \left\{ \mathcal{M}_1^{(+)} \otimes T_- \right\}_{\mu\nu} \right] \text{Tr}_C \left[ \lambda^a \exp \left\{ \mathcal{M}_2^{(+)} \otimes T_- \right\}_{\nu\mu} \right] . (4.23)
\]

With the expansion (1.4) and the properties
\[
\text{Tr}_C \left( \lambda^a T_+ \right) = \text{Tr}_C \left( \lambda^a I \right) = 0 , (4.24)
\]
\[
\text{Tr}_C \left( \lambda^a T_- \right) = n^b \text{Tr}_C \left( \lambda^a \lambda^b \right) = n^b 2 \delta^{ab} = 2 n^a , (4.25)
\]
we have the formula
\[
\text{Tr}_C \left[ \lambda^a \exp \left\{ \mathcal{M}_k^{(\kappa)} \otimes T_- \right\}_{\rho\sigma} \right] = 2 n^a \sinh \left\{ \mathcal{M}_k^{(\kappa)} \right\}_{\rho\sigma} . (4.26)
\]

Remembering the relation \( n^a n^a = 1 \), we then derive from (4.23)
\[
I_2[A] = \int_0^\infty dT_1 dT_2 \oint [dx_1]_{T_1} \oint [dx_2]_{T_2} \delta(x_1(0) - x_2(0)) \text{tr}_L \left[ \sinh \left\{ \mathcal{M}_1^{(+)} \right\} \sinh \left\{ \mathcal{M}_2^{(+)} \right\} \right] \\
= \frac{1}{4} \int_0^\infty dT_1 dT_2 \left[ \mathcal{N}^{(+,+)} \text{Tr}_L(e^{2i(T_1 + T_2)F}) - \mathcal{N}^{(+,-)} \text{Tr}_L(e^{2i(T_1 - T_2)F}) \right] \\
+ (F \to -F) , (4.27)
\]
where
\[
N^{(\kappa_1, \kappa_2)} = \int d^D y_1 \int d^D y_2 \left[ \prod_{k=1}^{2} \left( \int dx_k \right) \delta^D (y_1 - y_2) e^{S^{(\kappa_1, \kappa_2)}} \right] (4.28)
\]
with
\[
S^{(\kappa_1, \kappa_2)} = -\frac{1}{4} \sum_{k=1}^{2} T_k \int_0^{T_k} d\tau [\dot{x}_k^2 + 2i \kappa_k x_k \mathcal{F}_{\sigma \rho} \dot{x}_{k\rho}] .
\]
(4.29)

The normalizations \(N^{(\kappa_1, \kappa_2)}\) satisfy the following properties:
\[
N^{(+,+)} = N^{(+,-)} = N^{(-,+)} = N^{(-,-)},
\]
(4.30)

since, in the present case, the inversions of paths (i.e., the changes of \(\kappa\)'s signs) do not change the value of the path integral (4.28): note that all the initial and ending points of two closed loops are identical. The \((\mathcal{F} \rightarrow -\mathcal{F})\) terms in (4.27) lead again to a factor of two, and thus we have
\[
I_2[A] = \frac{1}{2} \int_0^{\infty} dT_1 dT_2 N^{(+,-)} \text{Tr}_L (e^{2i(T_1+T_2)\mathcal{F}} - e^{2i(T_1-T_2)\mathcal{F}}) .
\]
(4.31)

The quantity (4.28) can be evaluated as follows. Recalling the relation
\[
\delta^D (y_1 - y_2) = \lim_{T_3 \rightarrow 0} \left( \frac{1}{4\pi T_3} \right)^D \frac{\partial}{\partial T_3} \exp \left[ -\frac{1}{4T_3} (y_1 - y_2)^2 \right] ,
\]
(4.32)
we convert the \(\delta\)-function to the following path integral form:
\[
\delta^D (y_1 - y_2) = \lim_{T_3 \rightarrow 0} \int_{x_3(0)=y_1}^{x_3(T_3)=y_2} Dx_3 \exp \left[ -\frac{1}{4} \int_0^{T_3} \dot{x}_3^2(\tau) d\tau \right] ,
\]
(4.33)
and this leads to the relations
\[
N^{(\kappa_1, \kappa_2)} = \lim_{T_3 \rightarrow 0} N^{(\kappa_1, \kappa_2, 0)} = (4\pi)^{-D} \text{det}_L^{-1/2} \left( \frac{\sin \mathcal{F}T_1 \sin \mathcal{F}T_2}{\mathcal{F}^2} \right) \int d^D x_0 .
\]
(4.34)

We therefore have the expression
\[
I_2[A] = \frac{1}{2} (4\pi)^{-D} \int_0^{\infty} dT_1 dT_2 \text{det}_L^{-1/2} \left( \frac{\sin \mathcal{F}T_1 \sin \mathcal{F}T_2}{\mathcal{F}^2} \right) \\
\times \left[ \text{Tr}_L \cos 2\mathcal{F}(T_1 + T_2) - \text{Tr}_L \cos 2\mathcal{F}(T_1 - T_2) \right] \int d^D x_0 .
\]
(4.35)

It is interesting that the normalization \(N^{(\kappa_1, \kappa_2)}\) can still be obtained as a singular limit (the \(T_3 \rightarrow 0\) limit) from Eq. (4.18), although \(I_2\) is not a singular part of \(I_1\) (cf. (4.21)).
5 The world-line moduli integrals

In this section, we study the divergence structure of the Euler-Heisenberg-type action derived in the previous sections. In the world-line formalism, divergences come out explicitly after performing the proper time integrals (the $T_a$ integrals; $a = 1, 2, 3$ in the present case), and hence we have to examine how to perform these integrals before discussing renormalizations. However, generally speaking, multi-integrations are difficult to perform in an analytic way, and hence we here consider the simplest case corresponding to gluon two-point function parts.

Let us consider the Taylor expansions of $\Gamma[A]$ concerning $F$ (omitting constant terms) in the same way as done in the one-loop case. Expanding $I_1$ and $I_2$ up to the second order of $F$, we extract the following quantities from Eqs. (4.21) and (4.35):

$$I_1[A] = \frac{g_0^4 \mu^4 e}{(4\pi)^{4-2\epsilon}} \int d^D x_0 F_{\mu
u} F_{\mu\nu} \left\{ 30 C_1 + 42 C_2 + 48 C_3 + \frac{93}{2} C_4 - 2 C_5 - 10 C_6 \right. \right.$$

$$\left. - (17 C_1 + 29 C_2 + \frac{57}{2} C_3 + 32 C_4 - \frac{17}{3} C_6) \epsilon \right.$$ 

$$\left. - (2 C_1 + 2 C_2 + 5 C_3 + 6 C_4 - \frac{2}{3} C_6) \epsilon^2 \right\} + \cdots , \quad (5.1)$$

$$I_2[A] = \frac{g_0^4 \mu^4 e}{(4\pi)^{4-2\epsilon}} \int d^D x_0 F_{\mu
u} F_{\mu\nu} (-4) C_5 + \cdots , \quad (5.2)$$

with

$$C_1 = \int_0^\infty dT_1 dT_2 dT_3 \Delta^{\epsilon-4} T_1^4 T_2 e^{-m^2(T_1+T_2)}$$

$$C_2 = \int_0^\infty dT_1 dT_2 dT_3 \Delta^{\epsilon-4} T_1^3 T_2^2 e^{-m^2(T_1+T_2+T_3)}$$

$$C_3 = \int_0^\infty dT_1 dT_2 dT_3 \Delta^{\epsilon-4} T_1^3 T_2^3 e^{-m^2(T_1+T_2+T_3)}$$

$$C_4 = \int_0^\infty dT_1 dT_2 dT_3 \Delta^{\epsilon-4} T_1^2 T_2^2 T_3 e^{-m^2(T_1+T_2+T_3)}$$

$$C_5 = \int_0^\infty dT_1 dT_2 dT_3 \Delta^{\epsilon-4} T_1^3 T_2^3 \delta(T_3) e^{-m^2(T_1+T_2+T_3)}$$

$$C_6 = \int_0^\infty dT_1 dT_2 dT_3 \Delta^{\epsilon-4} T_1^4 T_2^3 \delta(T_3) e^{-m^2(T_1+T_2+T_3)} , \quad (5.3)$$

where we have put $D = 4 - 2\epsilon$ and $\Delta = T_1 T_2 + T_2 T_3 + T_3 T_1$. Also, the damping mass factor $e^{-m^2(T_1+T_2+T_3)}$ is inserted in each $C_i$ in the same way as in the one-loop calculation (Section 3).

In the meantime, we shall introduce the notation $\epsilon' = \{\epsilon; \epsilon > 1\}$ for $C_1$ and $C_6$, in order not to mix it up with the (usual) infinitesimal parameter $\epsilon > 0$. This description is indispensable for the convergency of the $C_1$ and $C_6$ integrals, although we shall set $\epsilon' = \epsilon$ after all, expecting the analytic continuation (see also Section 8-1-2 in [14]). The $\epsilon'$ divergences are related to the divergences from the artificial mass term insertion, since $C_1$ and $C_6$ contain tadpole contributions, which vanish in
the $m \to 0$ limit (in the sense of dimensional regularization).

In $C_5$ and $C_6$, all the integrals are easy to perform, and hence we simply write down

$$C_5 = (m^2)^{-2\varepsilon} \Gamma^2(\varepsilon),$$

$$C_6 = (m^2)^{-2\varepsilon} \Gamma(\varepsilon + 1)\Gamma(\varepsilon' - 1).$$

The rest of $C_i$ are computed in detail in Appendix [C], and we only show the results as follows:

$$C_1 = (m^2)^{-2\varepsilon} \frac{\Gamma(2\varepsilon)}{3 - \varepsilon} B(e' - 1, \varepsilon + 2) + (m^2)^{-2\varepsilon} \frac{1}{64} \Gamma(\varepsilon + 3)\Gamma(\varepsilon - 3)
\times [4B(2, \frac{1}{2}) F(2, 3 + \varepsilon, \frac{5}{2}, \frac{1}{4}) - 3B(3, \frac{1}{2}) F(3, 3 + \varepsilon, \frac{7}{2}, \frac{1}{4})]
+ (m^2)^{-2\varepsilon} 4^{-\varepsilon} \frac{\Gamma(2\varepsilon + 1)}{(3 - \varepsilon)(\varepsilon - 2)}[B(\varepsilon, \frac{1}{2}) \binom{3}{2} F(1, 2\varepsilon + 1, \varepsilon; \varepsilon - 1, \varepsilon + \frac{1}{2}, \frac{1}{4})
- \frac{3}{4} B(\varepsilon + 1, \frac{1}{2}) \binom{3}{2} F(1, 2\varepsilon + 1, \varepsilon + 1; \varepsilon - 1, \varepsilon + \frac{3}{2}, \frac{1}{4})],$$

$$C_2 = (m^2)^{-2\varepsilon} \frac{1}{64} \Gamma(3 + \varepsilon)\Gamma(\varepsilon - 3) B(3, \frac{1}{2}) F(3, 3 + \varepsilon; \frac{7}{2}, \frac{1}{4})
+ (m^2)^{-2\varepsilon} 4^{-\varepsilon} \frac{\Gamma(2\varepsilon)}{3 - \varepsilon} B(\varepsilon, \frac{1}{2}) \binom{3}{2} F(2, \varepsilon, \varepsilon - 2, \varepsilon; \frac{1}{2}, \frac{1}{4}),$$

$$C_3 = -C_4 + (m^2)^{-2\varepsilon} \frac{1}{16} \frac{\Gamma(4 + \varepsilon)\Gamma(\varepsilon - 2)}{(\varepsilon + 2)(\varepsilon + 3)} B(2, \frac{1}{2}) \binom{3}{2} F(4 - \varepsilon, 2 + \varepsilon, 2; 3 - \varepsilon, \frac{5}{2}, \frac{1}{4})
+ (m^2)^{-2\varepsilon} 4^{-\varepsilon} \Gamma(2\varepsilon) B(\varepsilon, \frac{1}{2}) \binom{3}{2} F(2, 2\varepsilon, \varepsilon - 1, \varepsilon + \frac{1}{2}, \frac{1}{4}),$$

$$C_4 = (m^2)^{-2\varepsilon} \frac{1}{32} \frac{\Gamma(4 + \varepsilon)\Gamma(\varepsilon - 2)}{(\varepsilon + 2)(\varepsilon + 3)} B(3, \frac{1}{2}) \binom{3}{2} F(4 - \varepsilon, 2 + \varepsilon, 3; 3 - \varepsilon, \frac{7}{2}, \frac{1}{4})
+ (m^2)^{-2\varepsilon} \frac{1}{2} 4^{-\varepsilon} \Gamma(2\varepsilon) \frac{\Gamma(2 - \varepsilon)}{\Gamma(4 - \varepsilon)} B(\varepsilon + 1, \frac{1}{2}) \binom{3}{2} F(2, 2\varepsilon, \varepsilon + 1; \varepsilon - 1, \varepsilon + \frac{3}{2}, \frac{1}{4}).$$

We can rewrite these expressions in terms of the hypergeometric function $F \equiv \binom{2}{1}$ only, and the results and their derivations are presented in Appendix [C] (see (C.20), (C.21), (C.38) and (C.39)). Since we could not find any convenient transformation formula from $\binom{3}{2} F_2$ to $\binom{2}{1} F_1$ in the literature, we have established a transformation technique in Appendix [C]. (A more concise explanation can be found in Appendix [D]).

Let us consider the expressions (C.20), (C.21), (C.38) and (C.39). We now perform the Taylor expansions of the hypergeometric functions around $\varepsilon = 0$, in order to see the divergence structures of the coefficients $C_i$. Here, we are only interested in $1/\varepsilon$ terms in the sense of the MS scheme, and the hypergeometric functions which contribute to the desired pole terms are only generated from the following expansion:

$$F(\alpha, a\varepsilon; \gamma + b\varepsilon; \frac{1}{4}) = F(\alpha, 0; \gamma; \frac{1}{4}).$$
\[ + a \varepsilon F^{(0,1,0)}(\alpha, 0; \gamma; \frac{1}{4}) + b \varepsilon F^{(0,0,1)}(\alpha, 0; \gamma; \frac{1}{4}) + \mathcal{O}(\varepsilon^2) , \quad (5.10) \]

where

\[ F^{(n,m,l)}(\alpha, \beta; \gamma; z) \overset{\text{def.}}{=} \partial^n \alpha \partial^m \beta \partial^l \gamma F(\alpha, \beta; \gamma; z) . \quad (5.11) \]

These differential coefficients (for \( \gamma \neq 0 \)) are evaluated by

\[ F(\alpha, 0; \gamma; z) = 1 , \quad F^{(0,0,1)}(\alpha, 0; \gamma; z) = 0 , \quad (5.12) \]

\[ F^{(0,1,0)}(\alpha, 0; \gamma; z) = F^{(1,0,0)}(0, \alpha; \gamma; z) = \frac{\alpha}{\gamma} z F_2(1, 1; 1 + 2\, \gamma + 1; z) . \quad (5.13) \]

Here we again encounter the generalized hypergeometric function \( _3F_2 \), however in the present case, it can be reduced to the ordinary hypergeometric function \( _2F_1 \) through the following formula (derived in Appendix D):

\[ _3F_2(1, \beta, n + 1; 2, \gamma; z) = \frac{1}{n} \sum_{k=1}^{n} F(k, \beta; \gamma; z), \quad (n \geq 1, |z| < 1, \Re(\gamma) > 0) . \quad (5.14) \]

Combining (5.13) and (5.14), we have

\[ F^{(0,1,0)}(n, 0; \gamma; z) = \frac{z}{\gamma} \sum_{k=1}^{n} F(k, 1; \gamma + 1; z) , \quad (n \geq 1, |z| < 1, \Re(\gamma) > 0) , \quad (5.15) \]

and thus

\[ F(n, a \varepsilon; \gamma + b \varepsilon; z) = 1 + \varepsilon \frac{a z}{\gamma} \sum_{k=1}^{n} F(k, 1; \gamma + 1; z) + \mathcal{O}(\varepsilon^2) , \quad (n \geq 1, |z| < 1, \Re(\gamma) > 0) . \quad (5.16) \]

Owing to this formula, all coefficients in front of \( 1/\varepsilon \) can be written in terms of \( _2F_1 \) and the gamma functions. After some algebra, we obtain

\[ C_i' = -\frac{1}{6\varepsilon^2} + \left( -\frac{5}{9} + \frac{\rho_m}{3} \right) \frac{1}{\varepsilon} + \mathcal{O}(1) , \quad C_2' = \frac{1}{6\varepsilon^2} + \left( \frac{1}{18} - \frac{\rho_m}{3} \right) \frac{1}{\varepsilon} + \mathcal{O}(1) , \]
\[ C_3' = \frac{1}{12\varepsilon^2} - \left( \frac{1}{72} + \frac{\rho_m}{6} \right) \frac{1}{\varepsilon} + \mathcal{O}(1) , \quad C_4' = -\frac{1}{12\varepsilon} + \mathcal{O}(1) , \]
\[ C_5' = \frac{1}{\varepsilon^2} - \frac{2\rho_m}{\varepsilon} + \mathcal{O}(1) , \quad C_6' = -\frac{1}{\varepsilon} + \mathcal{O}(1) . \quad (5.17) \]

where the overall factor \((4\pi \mu^2)^{2\varepsilon}\) seen in (5.1) and (5.2) is absorbed in \( C_i \); i.e.,

\[ C_i' = (4\pi \mu^2)^{2\varepsilon} C_i , \quad (5.18) \]

and we have defined

\[ \rho_m = \gamma_E + \ln \frac{m^2}{4\pi \mu^2} , \quad \gamma_E = \text{Euler const.} \quad (5.19) \]
Therefore from Eqs. (5.1), (5.2) and (5.17), we obtain

\[ I_1[A] = \frac{4g_0^4}{(4\pi)^4} \left[ \frac{4}{\varepsilon^2} + \left( -\frac{11}{2} - 8\rho_m \right) \frac{1}{\varepsilon} \right] \int d^Dx_0 \left( \frac{1}{4} F_{\mu\nu} F_{\mu\nu} \right) + O(\varepsilon^0) \] (5.20)

\[ I_2[A] = \frac{4g_0^4}{(4\pi)^4} \left[ \frac{4}{\varepsilon^2} + \frac{8\rho_m}{\varepsilon} \right] \int d^Dx_0 \left( \frac{1}{4} F_{\mu\nu} F_{\mu\nu} \right) + O(\varepsilon^0) \] (5.21)

and due to Eq. (2.1) the renormalization part of the effective action (purely gluon parts) at the 2nd order in \( F \) in our regularization is found to be

\[ \Gamma[A] = \frac{4g_0^4}{(4\pi)^4} \left( -\frac{11}{2\varepsilon} \right) \int d^Dx_0 \left( \frac{1}{4} F_{\mu\nu} F_{\mu\nu} \right) + O(\varepsilon^0) \] (5.22)

![Figure 2](image_url)

**Figure 2:** The “eight-figure” diagrams contained in the coefficients \( C_5 \) and \( C_6 \).

Finally, let us put a comment on what our results imply. Picking up \( C_5 \) and \( C_6 \) from Eqs. (5.1) and (5.2), and using (3.17), we extract the following quantities corresponding to self-energy parts:

\[ \Pi_{5\mu\nu}^{ab} = \frac{4\delta^{ab}}{(4\pi)^4} \left( k^2 \delta_{\mu\nu} - k_\mu k_\nu \right) (-6C_5') \] (5.23)

\[ \Pi_{6\mu\nu}^{ab} = \frac{4\delta^{ab}}{(4\pi)^4} \left( k^2 \delta_{\mu\nu} - k_\mu k_\nu \right) (-10C_6') \] (5.24)

As briefly shown in Appendix [A], the \( \Pi_5 \) and \( \Pi_6 \) exactly coincide with the Feynman diagram results, if the coefficients of gluon kinetic terms are evaluated in the region close to the light cone \( k^2 \to 0 \); in other words, if \( k^2 \) is much smaller than the mass parameter \( m^2 \). (Note that \( C_A = 2 \) in the \( su(2) \) case.) Thus, it is very natural to expect that the other coefficients \( C_1, C_2, C_3 \) and \( C_4 \) should possess the same meaning.

### 6 Conclusions and Discussions

In this paper, we have explicitly calculated the gluon parts of the two-loop Euler-Heisenberg actions, which are organized at the level of an implicit formulation in the previous paper [11]. The
present results are still preliminary to reach a clear physical quantity such as $\beta$-functions, however this paper is an important step toward a full-fledged extension of the world-line formalism to two-loop Yang-Mills theories. One of the main obstacles for this aim is the problem of how to integrate the proper time variables at higher loop calculations. Also, in the sense of field theory limit of string theory, this is an important problem: at the level of string theory, it is recognized as the problem how to perform the moduli integrals on a multiloop world-sheet.

We have performed the path integrals in Section 4, applying the world-line Green functions to all combinations of $su(2)$-like charges (the $\kappa$ signatures; q.v. (4.11), (4.12), (4.14) and (4.15)). Then extracting the parts corresponding to the wave function renormalization, we have been able to perform the world-line “moduli” integrals to reveal the divergence structure in Section 5. In the standard method, it is difficult to perform the loop integrals containing a mass parameter, while in our case, all the integrations are carried out in Appendix C, giving rise to (generalized) hypergeometric functions as a result. This is certainly a significant point from a theoretical viewpoint, and hence we have mainly focused on the technical issue concerning the integrations. We should also note that the pseudo-abelian technique has worked out both at one- and two-loop levels, with reproducing the Feynman diagram results of Appendix E. We expect that our integration method will straightforwardly apply to higher order terms in $\mathcal{F}$ as well.

Although we have verified that our results contain correct Feynman diagram contributions, the followings should further be investigated as a next step toward our goal: the coincidence between the present results and those by the Feynman diagram method can only be understood in the region close to the light cone $k^2 \to 0$ ($k^2 << m^2$), where $k_\mu$ are the external gluon momenta. On the other hand, as seen in Section 3, we do not have the restriction on $k^2$ at the one-loop level, in order to extract the $\beta$-function. Similarly we shall encounter the same difference in the ghost loop calculations, and should clarify the reason for this kind of discrepancy. Related to this issue, another question is whether or not we can evaluate the pole structures of $C_i$ for $m = 0$ (or $m^2 << k^2$). As inferred from Eqs. (E.14) and (E.16), the integrals $C_i$ might depend on the region of either $k^2 << m^2$ or not. However the present calculations do not indicate such a dependence, simply because $C_i$ are not the Fourier modes of gluon two-point function. To clarify this point, one should compute the correlator of two gluon vertex operators (of bosonic field representation) along the outline of Appendix B in Ref. [11]; in this case, the formulation should be extended to the super world-line formalism in order to optimize the inclusion of the four point interactions involving
external legs. Anyway, in order to find the correct $\beta$-function coefficient at two loops, we also have to add the contributions including the counter terms generated from one-loop divergences (in the massive formulation).

Following ref. \cite{20} a gauge symmetry breaking IR gluon mass $m^2$ (introduced there only as a device to separate IR and UV divergences) requires a further counter term

$$\frac{1}{2} Z_x m^2 A^\mu A_\mu \quad \text{with} \quad Z_x = -\frac{g^2 C_A}{16 \pi^2 \epsilon} \quad \text{(6.1)}$$

and $C_A = 2$ in our case, cancelling $m^2$ dependent singularities in the MS dimensional regularization scheme. Insertion of this counter term ‘gluon mass’ into the one-loop contribution of order $F^2$ as found in Eq. (3.15), i.e. calculating with $m^2 \rightarrow m^2 + Z_x m^2$ and expanding to first order in $\frac{m^2}{\epsilon}$, thus using

$$e^{-m^2 T} \rightarrow e^{-m^2 T}\left(1 - \frac{g^2 m^2 C_A}{16 \pi^2 \epsilon} T\right), \quad \text{(6.2)}$$

yields, e.g. a singular two-loop $F^2$-contribution:

$$\Gamma_{ct} = \frac{C_A}{2(4\pi)^{D/2}} \left(\frac{D}{12} - 2\right) \int_0^\infty dT T^{1-D/2} e^{-m^2 T} \left(-\frac{g^2 m^2 C_A}{16 \pi^2 \epsilon} T\right) \int d^D x_0 \text{Tr}_L F^2$$

$$= \frac{g^4 C_A^2}{(4\pi)^4} \left(\frac{10}{3\epsilon}\right) \int d^D x_0 \left(-\frac{1}{4} F_{\mu\nu} F_{\mu\nu}\right) + \mathcal{O}(\epsilon^0). \quad \text{(6.3)}$$

However in the background formalism there should be further counter terms including quantum as well as background fields. This has to be further analyzed in order to reproduce the usual $\beta$-function coefficient.

This paper concerns a theoretical interest, and is an important part of the ongoing long-term effort to find a way to getting over difficulties in the current calculation methods for higher loop amplitudes in field theory. Since the whole computation process in the world-line formalism looks completely different from the standard field theory calculations, the above questions are the milestones in the future study, and should be solved in order to make future practical applications successful.

**Acknowledgement**

We would like to thank M. Jamin for helpful discussions concerning infrared regularization.
A List of path reversal formulae

This appendix is a brief note on the reversals of path ordering and proper time directions. The standard definition of the path ordering (the normal type) is

\[
P \exp \left\{ \int_{\tau_{\alpha}}^{\tau_{\beta}} d\tau M_{\tau}[x] \right\} = \sum_{n=0}^{\infty} \frac{\tau_{\beta} - \tau_{\alpha}}{\tau_{\beta} - \tau_{\alpha}} \int_{\tau_{\alpha}}^{\tau_{\beta}} d\tau \cdots \int_{\tau_{\alpha}}^{\tau_{\beta}} d\tau_{n} M_{\tau_{n}}[x] \cdots M_{\tau_{1}}[x] ,
\]

and the anti-path ordering (used in [11] for a certain reason) is

\[
P^{*} \exp \left\{ \int_{\tau_{\alpha}}^{\tau_{\beta}} d\tau M_{\tau}[x] \right\} = \sum_{n=0}^{\infty} \frac{\tau_{\beta} - \tau_{\alpha}}{\tau_{\beta} - \tau_{\alpha}} \int_{\tau_{\alpha}}^{\tau_{\beta}} d\tau \cdots \int_{\tau_{\alpha}}^{\tau_{\beta}} d\tau_{n} M_{\tau_{n}}[x] \cdots M_{\tau_{1}}[x] .
\]

We here assume that the \( M_{\tau} \) in the above two definitions are the same objects.

The relations between the path and the anti-path ordering formulae are given by

\[
W^{ae}_{\mu\nu}[x; T, 0] = P \exp \left\{ \int_{0}^{T} d\tau M_{\tau}[x] \right\} = P^{*} \exp \left\{ \int_{0}^{T} d\tau M^{T}_{\tau}[x] \right\} ,
\]

\[
W^{ae}_{\mu\sigma\rho\nu}[x; S, \tau_{\alpha}, 0] = \text{Tr} C^{\lambda} P^{*} \exp \left\{ \int_{0}^{\tau_{\beta}} d\tau M^{T}_{\tau}[x] \right\} \frac{\lambda^{\mu}}{\nu_{\rho}} P^{*} \exp \left\{ \int_{\tau_{\alpha}}^{S} d\tau M^{T}_{\tau}[x] \right\} ,
\]

where the \( M^{T} \) represents the transposition on both the color and Lorentz spaces.

Note that the transposition makes an additional minus sign in front of the \( A \dot{\chi} \) term in \( M_{\tau} \). If we change the sign of gauge coupling \( g \), this additional sign drops out, and the starting formulae presented in Sect. 2 follows from the previous paper directly.

The other useful observation is related to path inversion: As can be seen from Eq. (2.7) by distinguishing \( \tau \) and \( \tau' \) carefully (see Eq. (4.1)), the following relation holds:

\[
(M_{\tau}[x^{-1}])^{ab}_{\mu\nu} = (M_{\tau_{\alpha} + \tau_{\beta} - \tau}[x])^{ba}_{\nu\mu} ,
\]

where \( x^{-1} \) denotes the inverted path \( x \), each of them defined by

\[
x : [\tau_{\alpha}, \tau_{\beta}] \rightarrow R^{4}, \quad \tau \mapsto x(\tau) ,
\]

\[
x^{-1} : [\tau_{\alpha}, \tau_{\beta}] \rightarrow R^{4}, \quad \tau \mapsto x^{-1}(\tau) := x(\tau_{\alpha} + \tau_{\beta} - \tau)
\]

respectively. As a consequence of Eq. (A.5) we have

\[
P \exp \left\{ \int_{\tau_{\alpha}}^{\tau_{\beta}} d\tau M_{\tau}[x] \right\}^{T} = P \exp \left\{ \int_{\tau_{\alpha}}^{\tau_{\beta}} d\tau M_{\tau}[x^{-1}] \right\} ,
\]

21
where again $T$ means transposition in both color as well as Lorentz space.

Describing path inversion by the $x^{-1}$ symbol is a useful tool in performing world-line calculations (rather than changing the direction of $\tau$ or other possibilities), because it nicely fits together with the following identities for world-line path integrals:\footnote{These identities can easily be verified from the path integral discretization.}

\[
\int_0^\infty d\tau e^{-\frac{1}{2}T^\mu_1 \dot{\tau}^\mu_1 + \frac{1}{4}T^\mu_1 T_\mu_1} = \int_0^\infty d\tau e^{-\frac{1}{2}T^\mu_1 \dot{\tau}^\mu_1 + \frac{1}{4}T^\mu_1 T_\mu_1} ,
\]

and consequently

\[
\int_0^\infty d\tau e^{-\frac{1}{2}T^\mu_1 \dot{\tau}^\mu_1 + \frac{1}{4}T^\mu_1 T_\mu_1} = \int_0^\infty d\tau e^{-\frac{1}{2}T^\mu_1 \dot{\tau}^\mu_1 + \frac{1}{4}T^\mu_1 T_\mu_1} ,
\]

where $F$ is an arbitrary functional and the integrands $F[x^{-1}]$ are to be understood as follows: for any path $x$ integrated over within the path integral the corresponding path $x^{-1}$ is to be constructed (in thoughts) and the functional is to be evaluated for this path $x^{-1}$. Thus, in the path integral, $x^{-1}$ depends on $x$. Note that we also have

\[
\int [Dx] S F[x] = \int d^D x \int Dx F[x] = \int d^D y \int Dx F[x^{-1}] = \int Dx F[x^{-1}] , \quad \text{(A.10)}
\]

i.e. our usual bracket notation for the free path integral part is not affected.

Using these relations and identities one can easily verify that the gluon propagator in a background, given by the world-line representation\cite{13}

\[
\Delta^{ab}_{\mu\nu}(x_1,x_2) = \int_0^\infty d\tau M_{\tau}[x] \quad \text{P exp} \left\{ \int_0^T d\tau M_{\tau}[x] \right\} ,
\]

satisfies the following property:

\[
\Delta^{ab}_{\mu\nu}(x_1,x_2) = \Delta^{ba}_{\mu\nu}(x_2,x_1) . \quad \text{(A.13)}
\]
B The derivation of $I_1[A]$

In this Appendix, we show some details for the computation in Section 4.1. First, we need various values of the quantity \( 4.17 \) at \((\tau, \tau') = (0, T_3)\) for \(a, b = 1, 3\), and those are given by the following. The necessary derivatives of the Green functions are

\[
\partial_\tau \partial_{\tau'} G_{\mu \nu}^{13}(\tau, \tau'; +, 0, -) \bigg|_{\tau=0, \tau'=T_3} = \left( \frac{2 T_2 F^2 \cos T_3 \sin F T_1 \sin F T_2 \sin F (T_1 + T_3)}{\sin F T_1 \sin F T_2 \sin F T_3 \sin F (T_1 + T_3)} \right)_{\mu \nu} \tag{B.1}
\]

\[
\partial_\tau \partial_{\tau'} G_{\mu \nu}^{13}(\tau, \tau'; 0, -, +) \bigg|_{\tau=0, \tau'=T_3} = \left( \frac{2 F \cos T_2 \sin F T_1 \sin F T_2 \sin F (T_1 + T_3)}{\sin F T_1 \sin F T_2 \sin F T_3 \sin F (T_1 + T_3)} \right)_{\mu \nu} \tag{B.2}
\]

\[
\partial_\tau \partial_{\tau'} G_{\mu \nu}^{13}(\tau, \tau'; +, -, 0) \bigg|_{\tau=0, \tau'=T_3} = \left( \frac{2 F \cos T_2 \sin F T_1 \sin F T_2 \sin F (T_1 + T_3)}{\sin F T_1 \sin F T_2 \sin F T_3 \sin F (T_1 + T_3)} \right)_{\mu \nu} \tag{B.3}
\]

\[
\partial_\tau \partial_{\tau'} G_{\mu \nu}^{33}(\tau, \tau'; +, 0, -) \bigg|_{\tau=0, \tau'=T_3} = \left( \frac{2 T_2 F^2 \cos T_3 \sin F T_1 \sin F T_2 \sin F (T_1 + T_3)}{\sin F T_1 \sin F T_2 \sin F T_3 \sin F (T_1 + T_3)} \right)_{\mu \nu} \\
+ 2 \left( 1 \delta(T_3) - \frac{F}{\sin F T_3} e^{i F T_3} \right)_{\mu \nu} \tag{B.4}
\]

\[
\partial_\tau \partial_{\tau'} G_{\mu \nu}^{33}(\tau, \tau'; 0, -, +) \bigg|_{\tau=0, \tau'=T_3} = \left( \frac{2 T_2 F^2 \cos T_3 \sin F T_1 \sin F T_2 \sin F (T_1 + T_3)}{\sin F T_1 \sin F T_2 \sin F T_3 \sin F (T_1 + T_3)} \right)_{\mu \nu} \\
+ 2 \left( 1 \delta(T_3) - \frac{F}{\sin F T_3} e^{-i F T_3} \right)_{\mu \nu} \tag{B.5}
\]

\[
\partial_\tau \partial_{\tau'} G_{\mu \nu}^{33}(\tau, \tau'; +, -, 0) \bigg|_{\tau=0, \tau'=T_3} = \left( \frac{2 T_2 F^2 \cos T_3 \sin F T_1 \sin F T_2 \sin F (T_1 + T_3)}{\sin F T_1 \sin F T_2 \sin F T_3 \sin F (T_1 + T_3)} \right)_{\mu \nu} \\
+ 2 \left( 1 \delta(T_3) - \frac{F}{\sin F T_3} \right)_{\mu \nu} \tag{B.6}
\]

The normalization constants are given by

\[
\mathcal{N}^{(+,-,0)} = (4\pi)^{-D} \det^1 L \left( \frac{F^2}{\sin F T_1 \sin F T_2 \sin F T_3 \sin F (T_1 + T_2)} \right) \int d^D x_0 , \tag{B.7}
\]

and the other values can be obtained by exchanging the labels \(a\) on \(\kappa_a\) and \(T_a\) simultaneously; for example,

\[
\mathcal{N}^{(+,0,-)} = \mathcal{N}^{(+,-,0)} \bigg|_{T_2 \leftrightarrow T_3} . \tag{B.8}
\]

Note also

\[
\mathcal{N}^{(+,+,0)} = \mathcal{N}^{(-,-,0)} = \mathcal{N}^{(\pm,+,0)} . \tag{B.9}
\]

Now, plugging in \((B.1-B.6)\) and the corresponding normalizations, for each line of Eqs. \((4.14)\) and \((4.15)\) we get an expression of the following structure:

\[
\mathcal{N}^{(\kappa_1,\kappa_2,\kappa_3)} \left[ \text{Tr}_L(\text{power series in } F) + \text{Tr}_L(\text{power series in } F) \cdot \text{Tr}_L(\text{power series in } F) \right] . \tag{B.10}
\]
Because of the antisymmetry of $F$, only even powers of $F$ contribute to the traces. Furthermore we have the property
\[ \mathcal{N}^{(\kappa_1, \kappa_2, \kappa_3)}(F) = \mathcal{N}^{(\kappa_1, \kappa_2, \kappa_3)}(-F), \]  
and thus (B.11) is invariant with respect to $F \to -F$. Therefore the $F \to -F$ terms in Eqs. (4.14) and (4.15) just give a factor of two.

Using this fact, the expressions (B.1–B.6) and the corresponding normalizations we obtain from Eqs. (4.14) and (4.15) straightforwardly:
\[
\Gamma_2[A] = -\frac{1}{2} \left( \frac{4\pi}{2D} \right) \int_0^\infty dT_1 dT_2 dT_3 \det \left( \frac{F^2}{\Delta_F^{(2)}} \right) \left\{ \text{Tr}_L \left[ \frac{F^2 T_2}{\Delta_F^{(2)}} \right] \left[ -2 \cos F(T_1 - T_3) \cos 2F(T_1 + T_3) + \cos F(T_3 - T_1) \right] \\
+ \cos F(T_1 - T_3) \text{Tr}_L \cos 2F(T_1 + T_3) \right\} \\
+ 2 \text{Tr}_L \left( \frac{F \sin F T_1}{\Delta_F^{(2)}} \left[ 2 \sin F T_3 \sin 2F(T_1 + T_3) - \cos F(2T_1 - T_3) \right] \\
+ \cos F(2T_1 + T_3) \text{Tr}_L \cos 2F T_3 \right) \right\} \int d^D x_0 ,
\]
and
\[
\Gamma_1[A] = -\frac{1}{2} \left( \frac{4\pi}{2D} \right) \int_0^\infty dT_1 dT_2 dT_3 \det \left( \frac{F^2}{\Delta_F^{(2)}} \right) \left\{ \text{Tr}_L \left[ \frac{F^2}{\sin F T_3} \left[ -2 \cos F(2T_1 + 3T_3) + \cos F(2T_1 + T_3) \text{Tr}_L \cos 2F T_3 \right] \\
+ 2 \cos F T_3 \text{Tr}_L \cos 2F(T_1 + T_3) \right) \\
+ \text{Tr}_L \left( \frac{\sin F T_1 \sin F T_3}{\Delta_F^{(2)/2}} - \frac{1}{T_2} \right) \left[ \cos 2F(T_3 - T_1) - \cos 2F T_3 \text{Tr}_L \cos 2F T_1 \right] \right) \\
+ \text{Tr}_L \left( \frac{F^2 T_2 \sin F T_1}{\Delta_F^{(2)/2}} \sin F T_3 \left[ 2 \cos 2F(T_1 + 2T_3) - \cos 2F(T_1 + T_3) \text{Tr}_L \cos 2F T_3 \right] \\
- \cos 2F T_3 \text{Tr}_L \cos 2F(T_1 + T_3) \right) \right) + \delta(T_3) 2(1-D) \text{Tr}_L \cos 2F T_1 \\
+ \delta(T_2) \left[ \text{Tr}_L \cos 2F(T_1 - T_3) - \text{Tr}_L(\cos 2F T_1) \cdot \text{Tr}_L(\cos 2F T_3) \right] \right\} \int d^D x_0 ,
\]
with
\[ \Delta_F^{(2)} = \sin F T_1 \sin F T_3 + F T_2 \sin F(T_1 + T_3) . \]
The sum of (B.12) and (B.13) gives $I_1[A]$ by definition, and is certainly equivalent to Eq. (4.21).

In order to obtain Eq. (4.21) itself, we should further take the following modification into account.

24
Exchanging $T_2$ and $T_3$, and using the relations followed from (B.14)

\[
\frac{F}{\sin F T_3} = \frac{F}{\Delta F^{(2)}} \sin F T_1 + \frac{F^2 T_2 \sin F (T_1 + T_3)}{\Delta F^{(2)} \sin F T_3},
\]
(B.15)

\[
\frac{1}{T_2} \sin F T_1 \sin F T_3 \frac{\Delta F^{(2)}}{T_2} = \frac{F}{\Delta F^{(2)}} \sin F (T_1 + T_3),
\]
(B.16)

we finally arrive at the full expression shown in Eq. (4.21).

### C Computational details of $C_i$

In this Appendix, we show the details of how to perform all the integrals in $C_1$, $C_2$, $C_3$ and $C_4$. Let us first perform the $T_3$ integrals in $C_i$. Applying the following formula to the $T_3$ parts in (5.3)

\[
\int_0^\infty e^{-pt}(1 + at)^{-\nu} dt = p^{\nu-1} a^{-\nu} e^{p/a} \Gamma(1 - \nu; p/a), \quad (a > 0)
\]
(C.1)

and then transforming the $T_1$ and $T_2$ integrals with

\[
\int_0^\infty dT_1 dT_2 f(T_1, T_2) = \int_0^\infty dTT \int_0^1 du f(T(1 - u), Tu),
\]
(C.2)

we obtain the followings for $i = 1$ and 2 (further using $m^2 T = t$)

\[
C_i = (m^2)^{-2\varepsilon} \int_0^\infty dt \int_0^1 duf_i(u)t^{2+\varepsilon} e^{-t+tu(1-u)} \Gamma(\varepsilon - 3; tu(1 - u)), \quad (i = 1, 2)
\]
(C.3)

and for $i = 3$ and 4

\[
C_i = -(m^2)^{-2\varepsilon} \int_0^\infty dt \int_0^1 duf_i(u)t^\varepsilon e^{-t+tu(1-u)} \left[ (3 - \varepsilon)t \Gamma(\varepsilon - 3; tu(1 - u)) + t^2u(1 - u) \frac{\partial}{\partial \xi} \Gamma(\varepsilon - 3; \xi) \right],
\]
(C.4)

where we have defined

\[
\xi = tu(1 - u)
\]
(C.5)

and

\[
f_i(u) = u^{i-2a}(1 - u)^{a+5-i}, \quad a = \left[ \frac{i - 1}{2} \right]_G
\]
(C.6)

with Gauss’ integer symbol $[ ]_G$. In the following, we evaluate (C.3) and (C.4) separately because we shall proceed on different technique and formulae.
C.1 C₁ and C₂

We now consider the t integration in (C.3). In the first place, it can be integrated in terms of the formula (6.455.1 in [19]):

\[
\int_0^\infty t^{\mu-1}e^{-pt}\Gamma(\nu, \alpha t)\,dt = \frac{\alpha\nu\Gamma(\mu + \nu)}{\mu(\alpha + p)^{\mu + \nu}} F(1, \mu + \nu; \mu + 1; \frac{p}{\alpha + p}),
\]

\[\text{Re} (\alpha + p), \text{Re} \mu, \text{Re} (\mu + \nu) > 0.\] (C.7)

Then applying the formula (9.131.2 in [19]),

\[
F(\alpha, \beta; \gamma; z) = \frac{\Gamma(\alpha + \beta - \gamma)\Gamma(\gamma)}{\Gamma(\alpha)\Gamma(\beta)} (1 - z)^{\gamma - \alpha - \beta} F(\gamma - \alpha, \gamma - \beta; \gamma - \alpha - \beta + 1; 1 - z)
\]

\[+ \frac{\Gamma(\gamma)\Gamma(\gamma - \alpha - \beta)}{\Gamma(\gamma - \alpha)\Gamma(\gamma - \beta)} F(\alpha, \beta; \alpha + \beta - \gamma + 1; 1 - z),\] (C.8)

we have

\[C_i = (m^2)^{-2\varepsilon} \int_0^1 du f_i(u) \Gamma(\varepsilon + 3)\Gamma(\varepsilon - 3) F(4 - \varepsilon, 3 + \varepsilon; 4 - \varepsilon; u(1 - u))
\]

\[+ (m^2)^{-2\varepsilon} \int_0^1 du f_i(u) [u(1 - u)]^{\varepsilon - 3} F(2\varepsilon, 1; \varepsilon - 2; u(1 - u)).\] (C.9)

In order to perform the u integrations, we consider the following change of variable: cutting the integration region (0, 1) in half, define \(u_+ (u_-)\) for larger (smaller) values of \(u\), and apply

\[u_\pm = \frac{1}{2}(1 \pm \sqrt{1 - y}).\] (C.10)

With this change of variable, the following formula holds for an arbitrary function \(H(u)\)

\[
\int_0^1 du f_i(u) H(u(1 - u)) = \frac{1}{4} \int_0^1 \frac{dy}{\sqrt{1 - y}} g_i(y) H(y/4),
\] (C.11)

where we have defined \(g_i(y)\) for all \(i\):

\[g_i(y) \equiv f_i\left(1 + \frac{\sqrt{1 - y}}{2}\right) + f_i\left(1 - \frac{\sqrt{1 - y}}{2}\right),\] (C.12)

and we hence have

\[g_1(y) = \frac{1}{16}y(4 - 3y), \quad g_2(y) = \frac{1}{16}y^2,\] (C.13)

\[g_3(y) = \frac{1}{8}y(2 - y), \quad g_4(y) = \frac{1}{8}y^2.\] (C.14)

At a glance, one may realize that the y integration can be performed by the formula (7.512.12 [19])

\[
\int_0^1 (1 - t)^{\nu - 1} F(\alpha, \beta; \gamma; z t)\,dt = B(\mu, \nu) \frac{3}{2} F_2(\alpha, \beta, \nu; \gamma, \mu + \nu; z),
\]

\[\text{Re} \mu, \text{Re} \nu > 0, |z| < 1\] (C.15)
and this is exactly the way we obtain the generalized hypergeometric \( _3F_2 \) expressions \((5.6)\) and \((5.7)\).

In order to further derive hypergeometric \( _2F_1 \) expressions, we rather notice the special case \( \gamma = \nu \) in \((C.13)\). Before applying \((C.13)\), we adjust auxiliary variables of \( _2F_1 \) until the special case is applicable, with using the formula \((9.137.18)\): 

\[
F(\alpha, \beta; \gamma; z) = \frac{\gamma - \alpha}{\gamma} F(\alpha, \beta; \gamma + 1; z) + \frac{\alpha}{\gamma} F(\alpha + 1, \beta; \gamma + 1; z). 
\]

\((C.16)\)

Before writing down the final results for \( C_1 \) and \( C_2 \), we here remark on the way how \( C_1 \) contains the \( \varepsilon' \) dependence. Using the following formula \((9.137.11)\) with \( \beta = 0 \)

\[
\gamma F(\alpha, \beta; \gamma; z) - \gamma F(\alpha, \beta + 1; \gamma; z) + \alpha z F(\alpha + 1, \beta + 1; \gamma + 1; z) = 0, 
\]

\((C.17)\)

and then decomposing the second term in \((C.9)\)

\[
F(2\varepsilon, 1; \varepsilon - 2; \frac{y}{4}) = 1 + \frac{2\varepsilon}{\varepsilon - 2} \frac{y}{4} F(2\varepsilon + 1, 1; \varepsilon - 1; \frac{y}{4}),
\]

\((C.18)\)

we extract the following integral from \( C_1 \):

\[
l_1 \overset{\text{def.}}{=} 4^{-\varepsilon} \Gamma(2\varepsilon) \int_0^1 y^{-2}(4 - 3y)(1 - y)^{-1/2} dy \\
= \Gamma(2\varepsilon) \int_0^1 u^{-\varepsilon}(1 - u)^{\varepsilon + 1} du = \Gamma(2\varepsilon)B(\varepsilon' - 1, \varepsilon + 2). 
\]

\((C.19)\)

Evaluating the \( l_1 \) contribution separately, we obtain the results written in terms of \( _2F_1 \) only:

\[
C_1 = (m^2)^{-2\varepsilon} \frac{\Gamma(2\varepsilon)}{3 - \varepsilon} B(\varepsilon' - 1, \varepsilon + 2) + (m^2)^{-2\varepsilon} \frac{1}{64} \Gamma(\varepsilon + 3) \Gamma(\varepsilon - 3) \times \\
\left[ 4B(2, \frac{1}{2}; F(2, 3 + \varepsilon; \frac{5}{2}, \frac{1}{4}) - 3B(3, \frac{1}{2}; F(3, 3 + \varepsilon; \frac{7}{2}, \frac{1}{4}) \right] \\
+ (m^2)^{-2\varepsilon} 4^{-\varepsilon} \frac{\Gamma(2\varepsilon + 1)B(\varepsilon, \frac{1}{2})}{(3 - \varepsilon)(\varepsilon - 2)(\varepsilon - 1)} \times \\
\left[ (\varepsilon - 2)F(1, 2\varepsilon + 1; \varepsilon + \frac{1}{2}; \frac{1}{4}) + F(2, 2\varepsilon + 1; \varepsilon + \frac{1}{2}; \frac{1}{4}) \right] \\
- (m^2)^{-2\varepsilon} 4^{-\varepsilon} \frac{3\Gamma(2\varepsilon + 1)B(\varepsilon + 1, \frac{3}{2})}{4(3 - \varepsilon)(\varepsilon - 2)} \left[ \frac{\varepsilon - 2}{\varepsilon} F(1, 2\varepsilon + 1; \varepsilon + \frac{3}{2}; \frac{1}{4}) \\
+ \frac{2(\varepsilon - 2)}{\varepsilon(\varepsilon - 1)} F(2, 2\varepsilon + 1; \varepsilon + \frac{3}{2}; \frac{1}{4}) + \frac{2}{\varepsilon(\varepsilon - 1)} F(3, 2\varepsilon + 1; \varepsilon + \frac{3}{2}; \frac{1}{4}) \right], 
\]

\((C.20)\)

\[
C_2 = (m^2)^{-2\varepsilon} \frac{1}{64} \Gamma(3 + \varepsilon) \Gamma(\varepsilon - 3) B(3, \frac{1}{2}; F(3, 3 + \varepsilon; \frac{7}{2}, \frac{1}{4}) \\
+ (m^2)^{-2\varepsilon} 4^{-\varepsilon} \frac{\Gamma(2\varepsilon)B(\varepsilon, \frac{1}{2})}{1 - \varepsilon} F(1, 2\varepsilon; \varepsilon + \frac{1}{2}; \frac{1}{4}) \\
- \frac{2}{2 - \varepsilon} F(2, 2\varepsilon; \varepsilon + \frac{1}{2}; \frac{1}{4}) + \frac{2}{(2 - \varepsilon)(3 - \varepsilon)} F(3, 2\varepsilon; \varepsilon + \frac{1}{2}; \frac{1}{4}) \right]. 
\]

\((C.21)\)
C.2  $C_3$ and $C_4$

In this case, we split $C_i; \ i = 3, 4$ as

\[
C_i = -(m^2)^{-2\epsilon} \left[ (3 - \epsilon)R_1 + R_2 + R_3 \right], \quad (C.22)
\]

where

\[
R_1 = \int_0^1 \frac{du}{u} \int_0^\infty t^{1+\epsilon} e^{-t+tu(1-u)} \Gamma(\epsilon - 3; tu(1-u)) dt , \quad (C.23)
\]

\[
R_2 = \int_0^1 \frac{du}{u} \int_0^\infty t^{2+\epsilon} e^{-t+tu(1-u)} \Gamma(\epsilon - 3; tu(1-u)) dt , \quad (C.24)
\]

\[
R_3 = \int_0^1 \frac{du}{u} \int_0^\infty t^{2+\epsilon} e^{-t+tu(1-u)} \frac{\partial}{\partial \xi} \Gamma(\epsilon - 3; \xi) dt . \quad (C.25)
\]

First, we integrate $R_2$ using (C.7) in the same way as done in (C.3):

\[
R_2 = \frac{\Gamma(2\epsilon)}{\epsilon + 3} \int_0^1 \frac{du}{u} \left[ u(1 - u) \right]^{\epsilon - 2} F(1, 2\epsilon; \epsilon + 4; 1 - u(1 - u)) du. \quad (C.26)
\]

Second, we notice that the incomplete gamma function is related to the Whittaker function:

\[
\Gamma(\nu, z) = z^{\nu - 1/2} e^{-z/2} W_{\nu - 1, -1/2}^\nu(z), \quad (C.27)
\]

and $W_{\kappa,\mu}(z)$ satisfy

\[
W_{\kappa,\mu}(z) = W_{\kappa, -\mu}(z), \quad (C.28)
\]

\[
z \frac{\partial}{\partial z} W_{\kappa,\mu}(z) = \left( \frac{z}{2} - \kappa \right) W_{\kappa,\mu}(z) - W_{\kappa+1,\mu}(z), \quad (C.29)
\]

\[
W_{\kappa,\mu}(z) = z^{1/2} W_{\kappa - 1/2, \mu + 1/2}(z) + \left( \frac{1}{2} - \kappa - \mu \right) W_{\kappa - 1, \mu}(z). \quad (C.30)
\]

Applying the formula (C.27) and its derivative to $R_1$ and $R_3$, one can prove the relation

\[
R_3 = \frac{\epsilon - 4}{2} R_1 - \frac{1}{2} R_2 + R_4 , \quad (C.31)
\]

where

\[
R_4 = \int_0^1 \frac{du}{u} \left[ u(1 - u) \right]^{\epsilon - 4/2} \int_0^\infty t^{3\epsilon/2} e^{-t+tu(1-u)/2} \frac{\partial}{\partial \xi} W_{\epsilon - 2, \epsilon/2}(\xi) dt . \quad (C.32)
\]

We here remove the derivative $\partial_\xi W$ from the r.h.s. of Eq. (C.32), making use of the relation (C.29):

\[
R_4 = \frac{1}{2} R_2 - \frac{\epsilon - 4}{2} R_1 - \int_0^1 \frac{du}{u} \left[ u(1 - u) \right]^{\epsilon - 4/2} \int_0^\infty t^{3\epsilon/2 - 1} e^{-t+tu(1-u)/2} W_{\epsilon - 2, \epsilon/2}(\xi) dt . \quad (C.33)
\]

28
Adjusting the indices on $W$ on the r.h.s. of (C.33) in terms of the recursion relation (C.30) (with $\kappa = (\varepsilon - 2)/2, \mu = (\varepsilon - 3)/2$), we then apply the formula

$$
\int_0^\infty t^\nu W_{\kappa,\mu}(at)e^{-pt}dt = \frac{\Gamma(\nu + \mu + \frac{3}{2})\Gamma(\nu - \mu + \frac{3}{2})a^{\mu+1/2}}{\Gamma(\nu - \kappa + 2)(p + a/2)^{\nu+\mu+3/2}}
\times F\left(\begin{array}{c} \nu + \mu + \frac{3}{2}, \mu - \kappa + \frac{1}{2} \\ \nu - \kappa + 2; \frac{2p-\alpha}{2p+a} \end{array} \right),
$$

(Re $\nu + \frac{3}{2} - |\text{Re} \mu| > 0$) \hspace{1cm} (C.34)

and the r.h.s. of (C.33) becomes

$$
\frac{1}{2}R_2 - \frac{\varepsilon - 4}{2}R_1 - (3-\varepsilon)R_1 - \frac{\Gamma(2\varepsilon)\Gamma(\varepsilon + 2)}{\Gamma(\varepsilon + 3)} \int_0^1 f_i(u)\left[u(1-u)\right]^\varepsilon-2 F(2\varepsilon, 1; \varepsilon + 3; 1 - u(1-u)) . \hspace{1cm} (C.35)
$$

Substituting this expression for $R_1$ in Eq.(C.34), which should then be inserted into Eq.(C.22), and thereby eliminating $R_1$, we calculate $C_i$ as follows:

$$
C_i = (m^2)^{-2\varepsilon} \int_0^1 du f_i(u)\left[u(1-u)\right]^\varepsilon-2 \left\{ \frac{-1}{3+\varepsilon} F(1, 2\varepsilon; \varepsilon + 4; 1 - u(1-u)) \right\}
+ \frac{1}{2 + \varepsilon} F(1, 2\varepsilon; \varepsilon + 3; 1 - u(1-u))
= \frac{(m^2)^{-2\varepsilon}\Gamma(2\varepsilon)}{4(2 + \varepsilon)(3 + \varepsilon)} \int_0^1 g_i(y)(1-y)^{-\frac{1}{2}}\left(\frac{y}{4}\right)^{\varepsilon-2} F(2, 2\varepsilon; \varepsilon + 4; 1 - \frac{y}{4}) dy , \hspace{1cm} (C.36)
$$

where we have used the transformations (C.11) and (C.16) at the second equality. We now transform the argument of the hypergeometric function from $1 - y/4$ to $y/4$ through the formula (C.8), and thus giving rise to $F(4 - \varepsilon; 2 + \varepsilon; 3 - \varepsilon; y/4)$ and $F(2, 2\varepsilon; \varepsilon - 1; y/4)$. (If we apply (C.15) at this stage, we obtain the generalized hypergeometric $_3F_2$ expressions (5.8) and (5.9).)

For the purpose to reduce $_3F_2$ to $_2F_1$, we apply (C.16) twice to the latter $F$ (two of them explained right above), and apply the following formula to the former $F$ (setting $\alpha = \gamma = 3 - \varepsilon, \beta = 2 + \varepsilon$):

$$
F(\alpha + 1, \beta; \gamma; z) = \frac{\beta}{\alpha} F(\alpha, \beta + 1; \gamma; z) + \frac{\alpha - \beta}{\alpha} F(\alpha, \beta; \gamma; z) . \hspace{1cm} (C.37)
$$

After that, we are able to integrate them by using (C.13) (with $\gamma = \nu$), and the results are therefore

$$
C_3 = (m^2)^{-2\varepsilon} \frac{\Gamma(4 + \varepsilon)\Gamma(\varepsilon - 2)}{16 (\varepsilon + 2)(\varepsilon + 3)(3 - \varepsilon)} B(2, \frac{5}{2}) \left[ (2 + \varepsilon)F(2, 3 + \varepsilon; \frac{5}{2}; 4) + (1 - 2\varepsilon)F(2, 2 + \varepsilon; \frac{5}{2}; 4) \right]
+ (m^2)^{-2\varepsilon}\frac{\Gamma(2\varepsilon)}{\Gamma(4 - \varepsilon)} \frac{B(\frac{5}{2}, \varepsilon)}{(\varepsilon - 1)4^\varepsilon} \left[ (\varepsilon - 3)F(2, 2\varepsilon; \varepsilon + \frac{1}{2}; 4) + 2F(3, 2\varepsilon; \varepsilon + \frac{1}{2}; 4) \right] - C_4 , \hspace{1cm} (C.38)
$$
\[ C_4 = (m^2)^{-2\varepsilon} \left( \frac{\Gamma(4+\varepsilon)}{32 (\varepsilon+2)(\varepsilon+3)(3-\varepsilon)} \right) \frac{1}{\varepsilon} \Gamma(4+\varepsilon) \Gamma(\varepsilon-2) \frac{1}{\varepsilon} \left( (2+\varepsilon) F(3,3+\varepsilon; \frac{7}{2}; \frac{1}{4}) \right) \]

\[ + (1-2\varepsilon) F(3,2+\varepsilon; \frac{7}{2}; \frac{1}{4}) \]

\[ + (m^2)^{-2\varepsilon} \Gamma(2\varepsilon) \frac{\Gamma(\varepsilon+1)}{\Gamma(4-\varepsilon)} \left( \varepsilon - 1 \right)^4 \frac{1}{\varepsilon} \Gamma(\varepsilon-1) \frac{1}{\varepsilon} \left( (\varepsilon - 3) F(2,2\varepsilon; \varepsilon + \frac{3}{2}; \frac{1}{4}) \right) \]

\[ + 4(\varepsilon-3) F(3,2\varepsilon; \varepsilon + \frac{3}{2}; \frac{1}{4}) + 6 F(4,2\varepsilon; \varepsilon + \frac{3}{2}; \frac{1}{4}) \] \hspace{1cm} (C.39)

\section*{D \hspace{0.5cm} The proof of Eq.(5.14)}

We show the outline of how to prove the formula (5.14). Basically we follow the same technique as we used in Appendix C, with using (C.15) and (C.16) for the aim of rearranging \( _3F_2 \) into \( _2F_1 \). We evaluate the l.h.s. of Eq. (C.15) in two ways: one is the direct result (the r.h.s. of the formula), and the other is a combination with (C.16).

On the one hand, setting \( \gamma = \nu - n \) in (C.15), we have

\[ \int_0^1 (1-t)^{\mu-1} t^{\nu-1} F(\alpha, \beta; \nu - n; zt) dt = B(\mu, \nu) _3F_2(\alpha, \beta, \nu - n, \mu + \nu; z), \]

\hspace{2cm} (Re \mu, Re \nu > 0, |z| < 1) \hspace{1cm} (D.1)

On the other hand, using (C.16) \( n \geq 1 \) times, the integrand in Eq. (D.1) can be expanded as

\[ (1-t)^{\mu-1} t^{\nu-1} \prod_{k=1}^n \frac{\nu - \alpha - k}{\nu - k} \sum_{r=0}^n \prod_{p=1}^r \frac{\alpha + p - 1}{\nu - \alpha - p} \left( \frac{n}{r} \right) F(\alpha + r, \beta; \nu - n; zt), \]

\hspace{2cm} (D.2)

where we define \( \prod_{p=1}^0 \equiv 1 \). Then applying (C.15) (with the case \( \gamma = \nu \)) to this expression, the l.h.s. of (D.2) becomes

\[ B(\mu, \nu) \prod_{k=1}^n \frac{\nu - \alpha - k}{\nu - k} \sum_{r=0}^n \prod_{p=1}^r \frac{\alpha + p - 1}{\nu - \alpha - p} \left( \frac{n}{r} \right) F(\alpha + r, \beta; \mu + \nu; z). \]

\hspace{2cm} (D.3)

We thus have the equality

\[ _3F_2(\alpha, \beta, \nu; \nu - n, \mu + \nu; z) = \prod_{k=1}^n \frac{\nu - \alpha - k}{\nu - k} \sum_{r=0}^n \prod_{p=1}^r \frac{\alpha + p - 1}{\nu - \alpha - p} \left( \frac{n}{r} \right) F(\alpha + r, \beta; \mu + \nu; z). \]

\hspace{2cm} (D.4)

Putting \( \alpha = 1, \nu = n + 2 \), and using the identity

\[ \prod_{p=1}^r \frac{p}{n + 1 - p} \left( \frac{n}{r} \right) = 1, \] \hspace{1cm} (D.5)

we therefore have proven the formula (5.14):

\[ _3F_2(1, \beta, n + 2; 2, \mu + \nu; z) = \frac{1}{n + 1} \sum_{r=0}^n F(r + 1, \beta; \mu + \nu; z), \]

\hspace{2cm} (D.6)
which holds for \( \Re(\mu), \Re(\nu) > 0, |z| < 1 \) and \( n \geq 0 \) (we have proven it for \( n \geq 1 \), but the \( n = 0 \) case is trivial).

## E  Feynman diagram results

In this Appendix, we present some Feynman diagram calculations in reference to the results obtained by our method. We follow the same notations as Refs. [17, 18] in the Minkowski space, however use the massive propagator in the (background) Feynman gauge:

\[
\frac{a}{\mu} \gamma^\mu \gamma^\nu b = (-i) \frac{\delta^{ab} g^{\mu\nu}}{k^2 - m^2 + i\epsilon}.
\]

We only deal with the parts which contain the “eight-figure” vacuum diagram. When the massive propagator is introduced, the tadpole contributions remain (see the diagrams (a) and (b) in Figure 2). After some calculations, the tadpole diagram (a) reads

\[
\Pi^{(a)}_{\mu\nu} = g^4 \frac{C_A^2 \delta^{ob}}{(4\pi)^{2-\epsilon}} (m^2)^{1-\epsilon} (3 - 2\epsilon) \Gamma(\epsilon - 1) \left[ 8(k^2 g_{\mu\nu} - k_\mu k_\nu) J_1 + D(k_\mu k_\nu J_1 + 4k_\nu J_2 + 4J_3) \right],
\]

where

\[
J_1 = \int \frac{d^D p}{(2\pi)^{D/2}} \frac{1}{((p + k)^2 - m^2)(p^2 - m^2)^2},
\]

\[
J_2 = \int \frac{d^D p}{(2\pi)^{D/2}} \frac{p_\mu}{((p + k)^2 - m^2)(p^2 - m^2)^2},
\]

\[
J_3 = \int \frac{d^D p}{(2\pi)^{D/2}} \frac{p_\mu p_\nu}{((p + k)^2 - m^2)(p^2 - m^2)^2},
\]

and these are equal to

\[
J_1 = \frac{\Gamma(\epsilon + 1)}{(4\pi)^{2-\epsilon}} j_1, \quad J_2 = \frac{\Gamma(\epsilon + 1)}{(4\pi)^{2-\epsilon}} k_\mu j_2,
\]

\[
J_3 = \frac{\Gamma(\epsilon + 1)}{(4\pi)^{2-\epsilon}} \left( \frac{1}{2\epsilon} g_{\mu\nu} j_3 - \frac{1}{2} k_\mu k_\nu j_2 \right),
\]

with

\[
j_1 = \int_0^1 x \left( m^2 - k^2 (x - x^2) \right)^{-1-\epsilon} dx,
\]

\[
j_2 = \int_0^1 x (1 - x) \left( m^2 - k^2 (x - x^2) \right)^{-1-\epsilon} dx,
\]

\[
j_3 = \int_0^1 x \left( m^2 - k^2 (x - x^2) \right)^{-\epsilon} dx = \frac{1}{2} (m^2)^{-\epsilon} - \frac{1}{2} \epsilon k^2 (2j_2 - j_1).
\]
Thus Eq. (E.1) becomes
\[
\Pi^{(a)}_{\mu\nu} = g^4 \frac{C_2^2 \delta^{ab}}{(4\pi)^{4-2\epsilon}} (m^2)^{1-\epsilon} (3 - 2\epsilon) \Gamma(\epsilon - 1) \Gamma(\epsilon + 1) \left[ \frac{D}{\epsilon} (m^2)^{-\epsilon} 
+ (k^2 g_{\mu\nu} - k_\mu k_\nu) \left( (D - 8) j_1 - 2Dj_2, \right) \right],
\] (E.9)
and the other tadpole diagram (b) is calculated as
\[
\Pi^{(b)}_{\mu\nu} = g^4 \frac{C_2^2 \delta^{ab}}{(4\pi)^{4-2\epsilon}} (m^2)^{1-2\epsilon} g_{\mu\nu} (3 - 2\epsilon) D \Gamma(\epsilon - 1) \Gamma(\epsilon) .
\] (E.10)
As a result, the sum of these tadpole contributions takes the transversal form:
\[
\Pi^{ab}_{\mu\nu} = \Pi^{(a)}_{\mu\nu} + \Pi^{(b)}_{\mu\nu}
= g^4 \frac{C_2^2 \delta^{ab}}{(4\pi)^{4-2\epsilon}} (m^2)^{1-\epsilon} (3 - 2\epsilon) \Gamma(\epsilon - 1) \Gamma(\epsilon + 1) 
\times (k^2 g_{\mu\nu} - k_\mu k_\nu) \left[ (D - 8) j_1 - 2Dj_2 \right].
\] (E.11)
When \( k^2 \to 0 \) (\(|k^2| << m^2\)), the quantities \( j_i \) behave as
\[
\begin{align*}
j_1 & = \frac{1}{2} (m^2)^{-1-\epsilon} , \quad j_2 = \frac{1}{6} (m^2)^{-1-\epsilon} , \quad j_3 = \frac{1}{2} (m^2)^{-\epsilon} ,
\end{align*}
\] (E.12)
and when \( m^2 \to 0 \), they reduce to
\[
\begin{align*}
j_1 & = \frac{1}{2} (-k^2)^{-1-\epsilon} B(\epsilon, -\epsilon) , \quad j_2 = (-k^2)^{-1-\epsilon} B(1 - \epsilon, 1 - \epsilon) , \quad j_3 = \frac{1}{2} (-k^2)^{-\epsilon} B(1 - \epsilon, 1 - \epsilon) .
\end{align*}
\] (E.13)
Therefore in these limits Eq. (E.11) behaves
\[
\Pi^{ab}_{\mu\nu} = g^4 \frac{C_2^2 \delta^{ab}}{(4\pi)^{4}} (k^2 g_{\mu\nu} - k_\mu k_\nu) \left\{ \begin{array}{ll}
\frac{10}{\epsilon} & (k^2 \to 0) \\
0 & (m = 0)
\end{array} \right. + O(1).
\] (E.14)
Next, the diagram (c) amounts to
\[
\Pi^{(c)}_{\mu\nu} = -6g^4 \frac{C_2^2 \delta^{ab}}{(4\pi)^{4}} (k^2 g_{\mu\nu} - k_\mu k_\nu) \exp[2\epsilon \ln(4\pi\mu^2)] \Gamma^2(\epsilon)(2j_3)^2 ,
\] (E.15)
where \( j_3 \) is given by (E.8). Substituting Eqs. (E.12) and (E.13) for this \( j_3 \) in each limit, we derive the following limits of (E.15):
\[
\Pi^{(c)}_{\mu\nu} = g^4 \frac{C_2^2 \delta^{ab}}{(4\pi)^{4}} (k^2 g_{\mu\nu} - k_\mu k_\nu) \left\{ \begin{array}{ll}
-\frac{6}{\epsilon^2} + \frac{12}{\epsilon} \rho_m & (k^2 \to 0) \\
-\frac{6}{\epsilon^2} - \frac{24}{\epsilon} + \frac{12}{\epsilon} \rho & (m = 0)
\end{array} \right. + O(1),
\] (E.16)
where $\rho_m$ is given by (5.19), and

$$\rho = \gamma_E + \ln \frac{-k^2}{4\pi \mu^2}. \quad (E.17)$$

We therefore conclude that our results coincide with the Feynman diagram calculations in the situation $k^2 \to 0$ ($m \neq 0$) (q.v. (5.23) and (5.24)):

$$\Pi_{T, \mu\nu}^{ab} = g_0 \frac{C^2}{(4\pi)^4} (k^2 g_{\mu\nu} - k_{\mu}k_{\nu}) (-10C_6) = \Pi_{6, \mu\nu}^{ab}, \quad (E.18)$$

$$\Pi^{(e), \mu\nu}^{ab} = g_0 \frac{C_2^2}{(4\pi)^4} (k^2 g_{\mu\nu} - k_{\mu}k_{\nu}) (-6C_5) = \Pi_{5, \mu\nu}^{ab}. \quad (E.19)$$
