Abstract: Higher derivative couplings of hypermultiplets to 6D, \(N = (1, 0)\) supergravity are obtained from dimensional reduction of 10D heterotic supergravity that includes order \(\alpha'\) higher derivative corrections. Reduction on \(T^4\) is followed by a consistent truncation. In the resulting action the hyperscalar fields parametrize the coset \(\text{SO}(4, 4)/\text{SO}(4) \times \text{SO}(4)\). While the \(\text{SO}(4, 4)\) symmetry is ensured by Sen’s construction based on string field theory, its emergence at the field theory level is a nontrivial phenomenon. A number of field redefinitions in the hypermultiplet sector are required to remove several terms that break the \(\text{SO}(4) \times \text{SO}(4)\) down to its \(\text{SO}(4)\) diagonal subgroup in the action and the supersymmetry transformation rules. Working with the Lorentz Chern-Simons term modified 3-form field strength, where the spin connection has the 3-form field strength as torsion, is shown to simplify considerably the dimensional reduction.

Keywords: Supergravity Models, Superstrings and Heterotic Strings, Supersymmetry and Duality

ArXiv ePrint: 2110.13163
1 Introduction

Studies of higher derivative supergravities in lower than ten dimensions with no known string theory origin have uses in exploring whether they may provide effective field theories that may possibly have a consistent UV completion [1]. Matter coupled $N = (1, 0), 6D$ supergravities [2–4] provide a rich landscape to investigate this question (see, for example, [5, 6]). In particular, $R$-symmetry gauged and remarkably anomaly free such supergravities exist [7–10] that are not embedded in string theory, and as such their higher derivative corrections are of great interest. At the level of two derivatives, such supergravities have been known for sometime [2–4] and one of their salient features is the occurrence of quaternionic Kahler sigma models that describe the hypermultiplet scalars. Their higher derivative extensions, on the other hand, have not been investigated so far, with the exception of [11], where, however, the hypermultiplet couplings were not considered. One of the motivations for the current work is to initiate this program. We shall not consider
$R$-symmetry gauging and Yang-Mills coupling in this paper but we shall study the higher derivative couplings of the hypermultiplets as a first step. We will work on-shell.\footnote{Four-derivative $N = (1, 0)$ invariants have been constructed off-shell \cite{12–17} but they do not include hypermultiplets. Moreover, the elimination auxiliary fields gives rise to infinitely many terms whose relation to Noether procedure construction of higher derivative couplings, or string theory low energy effective action, is not entirely clear. The role of highly nonlinear field redefinitions is another complicating factor. For an earlier preliminary work on on-shell 6$D$ higher derivative supergravity see \cite{18}.}

One approach to study of higher derivative extension of matter coupled supergravities is to employ Noether procedure. However, already at the four-derivative level, even with the assumption that the quaternionic Kahler structure is preserved in the case of $N = (1, 0)$, 6$D$ supergravity, one finds that an appropriate ansatz contains a large number of terms, and their variations under supersymmetry gives even larger set of structures that need to vanish. Furthermore, it is not guaranteed that the quaternionic Kahler structure can be maintained. One exception is the case of Grassmannian coset $Gr(n, 4) = SO(n, 4)/(SO(n) \times SO(4))$. It has been proven by Sen \cite{19} that the dimensional reduction of heterotic supergravity with gauge fields truncated to the Cartan subalgebra must exhibit at string tree level, and therefore to all orders in $\alpha'$, a continuous $O(d, d + 16; R)$ global symmetry, related to the $O(d, d+16; Z)$ T-duality of heterotic strings on a $d$-torus. See also \cite{20} where the symmetries of S-matrix elements of massless states were used to explain this symmetry. At the two-derivative level, and in the bosonic sector, sometime ago Maharana and Schwarz \cite{21} showed that reduction on $T^d$ does give an $O(d, d + 16; R)$ invariant result. In a relatively recent work, it was shown that the effective action for the bosonic string, as well as the bosonic sector of the heterotic string at the four-derivative level, in the absence of Yang-Mills fields, do yield $O(d, d; R)$ invariant action upon reduction on $T^d$ \cite{22}. Soon after, the Yang-Mills were taken into account to obtain $O(d, d + 16; R)$ invariant result \cite{23}, where, however, the fermionic sector was not considered. For an earlier work where only the scalar fields are kept, see \cite{24}. As for the reduction of Type II string effective actions on $K3$ in which only the NS-NS sector fields $(g_{\mu \nu}, B_{\mu \nu}, \varphi)$ are kept at the four-derivative level in 6$D$, see for example \cite{25}. Another approach to obtaining the higher derivative extended $O(d, d)$ invariant supergravities, or their bosonic sector thereof, is to employ the $\alpha'$ extended double field theories \cite{26–30}. The reduction of double field theory in the bosonic sector has been carried out in \cite{29}, and we shall comment further on this in section 6.

Inclusion of the fermionic sector in the reduction requires that the dimension of the torus is specified. In this paper we will work out the dimensional reduction of full heterotic supergravity to six-dimensions, including its fermionic sector, with its order $\alpha'$ four-derivative corrections a la Bergshoeff and de Roo \cite{31}, but leaving out the Yang-Mills multiplets, and consistently truncating to $(1, 0)$ supersymmetry. While the $T^4$ reduction gives $(1, 1)$ supergravity multiplet coupled to four $(1, 1)$ vector multiplets, the truncation sets to zero the vector fields, and appropriate fermions, resulting in (reducible) $(1, 0)$ supergravity, consisting of pure $(1, 0)$ supergravity plus a single tensor multiplet, coupled to four $(1, 0)$ hypermultiplets. As expected, we do find an $O(4, 4)$ invariant result in 6$D$. More specifically, the hyperscalars parametrize the coset space $SO(4, 4)/(SO(4)_+ \times SO(4)_-)$. In arriving at this result, we shall see that there are several terms that naively arise which are
invariant only under the SO(4) diagonal subgroup of SO(4) \(_+ \times SO(4)\)\(_-\), and that the required cancellation of all of these terms is nontrivial, requiring elaborate field redefinitions of hyperscalars and hyperfermions. In the computation of the \(\mathcal{O}(\alpha')\) terms in the action and supertransformations, we work from the outset with the Lorentz Chern-Simons modified field strength in which the spin connection has bosonic torsion furnished by the 3-form field strength itself. This approach is shown to simplify the calculations considerably. In particular the extension of the Lorentz Chern-Simons term modified 3-form field strength to include a Chern-Simons form built out of the composite connection arises readily.

Given the motivation for the higher derivative extension of supergravities with no known string origin, the reasons for studying the reduction of heterotic supergravity are two-folds. Firstly, once we get a handle on the structure of the higher derivative couplings for the Grassmannian coset \(Gr(4,4)\), we expect that it can be extended readily to \(Gr(n,4)\) and more to the point, we can deform the theory by \(R\)-symmetry gauging in an anomaly free fashion. Such extensions typically do not follow from string theory. Second, the lessons learned from the \(Gr(n,4)\) case may be utilized in the direct 6D construction of higher derivative couplings of the other quaternionic Kahler spaces [32–35]. Such couplings, unlike the case of \(Gr(n,4)\), are not guaranteed, and they will be treated elsewhere.

The paper is organized as follows. In section 2 we present the heterotic supergravity action with its four-derivative extension a la Bergshoeff and de Roo. In section 3, we provide the set up and useful results in working out the dimensional reduction. In section 4 we obtain the reduction at the two-derivative level, and in section 5 we carry out the reduction at \(\mathcal{O}(\alpha')\). In section 6, the field redefinitions as well as the resulting SO(4,4) invariant action, and the reduction of the supertransformations at \(\mathcal{O}(\alpha')\) are given. In section 6, the bosonic sector of our results are examined more closely, and are shown to agree completely with those of [22]. Our results are summarized and future directions are pointed out in section 7. Our notations and conventions are given in appendix A, the field redefinitions are described in appendix B, and the 6D action and supertransformations are summarized in their simplest form in appendix C.

2 Higher derivative heterotic supergravity

The heterotic supergravity multiplet consists of the fields

\[
(e_\mu^r, \psi_\mu, B_{\mu\nu}, \chi, \varphi),
\]

where the spinors are Majorana-Weyl with chiralities \(\gamma_{11}\psi_\mu = \psi_\mu\) and \(\gamma_{11}\chi = -\chi\), and \(\mu, r = 0, 1, \ldots, 9\). The Bergshoeff-de Roo extended heterotic supergravity Lagrangian, in the absence of Yang-Mills multiplets, and in string frame and up to quartic fermion terms, takes the form [31]

\[
\mathcal{L} = \mathcal{L}_0 + \mathcal{L}_{\mathcal{O}(\alpha')} + \mathcal{L}_{\alpha'}(R^2),
\]

\[
\mathcal{L}_0 = ee^{2\varphi}\left[\frac{1}{4}R(\omega) + g^{\mu\nu}\partial_\mu\varphi\partial_\nu\varphi - \frac{1}{12}H_{\mu\nu\rho}H^{\mu\nu\rho}
- \frac{1}{2}\bar{\psi}_\mu\gamma^{\mu\nu}D_\nu(\omega)\psi_\rho + 2\bar{\chi}\gamma^{\mu\nu}D_\mu(\omega)\psi_\nu + 2\bar{\chi}\gamma^{\mu\nu\rho}D_\mu(\omega)\chi
\right],
\]

\[
\mathcal{L}_{\mathcal{O}(\alpha')} = 0,
\]

\[
\mathcal{L}_{\alpha'}(R^2) = 0.
\]
\[ -\frac{1}{24} H_{\mu
u\rho} \left( \bar{\psi}^\sigma \gamma_{[\sigma} \gamma^{\mu\nu\rho] \gamma_{\tau]} \psi^\tau + 4 \bar{\psi}_\sigma \gamma^{\rho\sigma\mu
u\rho} \chi - 4 \chi_{\mu\nu\rho} \right) \]
\[ - \partial_\mu \bar{\psi}^{\mu\nu} \left( \bar{\psi}^{\nu} \gamma_\nu \psi_\nu + 2 \bar{\psi}^{\nu} \gamma_\nu \chi_\nu \right) \],
\[ \mathcal{L}_{0; O(a)} = \alpha' e^{2\varphi} \left[ H^{\mu
u\rho} \omega_{\mu
u\rho}^L(\Omega_-) - H^{\mu
u\rho} R_{\mu
u}^{\rho\tau}(\Omega_-) \bar{\psi}_\tau \gamma_\rho \psi_s \right. \]
\[ + \bar{\psi}_\tau \gamma_\rho \psi_s \Omega_{-\rho}^{\tau\rho} \epsilon^{-2\varphi} D_\mu(\Gamma)(e^{2\varphi} H^{\mu
u\rho}) \]
\[ + \frac{1}{4} \omega^{L}_{\mu
u\rho}(\Omega_-) \left( \bar{\psi}^{\sigma} \gamma_{[\sigma} \gamma^{\mu\nu\rho]} \gamma_{\tau]} \psi^\tau + 4 \bar{\psi}_\sigma \gamma^{\rho\sigma\mu\nu\rho} \chi - 4 \chi_{\mu\nu\rho} \right) \],
\[ \mathcal{L}_{\alpha'}(R^2) = \alpha' e^{2\varphi} \left[ -\frac{1}{4} R_{\mu
u\tau\rho}(\Omega_-) R_{\mu\nu\tau\rho}(\Omega_-) - 2 R_{\mu
u\tau\rho}(\Omega_-) \bar{\psi}_\tau \gamma_\rho \psi_s \right. \]
\[ + \bar{\psi}_\tau \gamma_\rho \psi_s \omega^{L}_{\tau\rho}(\Omega_-) \left( \bar{\psi}^{\sigma} \gamma_{[\sigma} \gamma^{\rho\mu\nu} \psi_\rho + 2 \gamma_\rho \chi_\rho \right) - \bar{\psi}_\tau \gamma_\rho \psi_s \omega^{L}_{\tau\rho}(\Omega_-) \psi_s \]
\[ - \frac{1}{12} H_{\mu
u\rho} \bar{\psi}_{\tau\rho} \gamma_{\mu\nu} \psi_s \],
\[ \Omega_{\pm\mu\nu\rho} = \omega_{\mu\nu\rho} \pm H_{\mu\nu\rho}, \quad H_{\mu
u\rho} = 3 \partial_{[\mu} B_{\nu\rho]}.
\]
indices are rotated by the torsionful connection $\Omega_-$. This asymmetric occurrence of the spin connection arises because the construction of $\mathcal{L}_{\alpha'}(R^2)$ relies on treating $R_{\mu\nu rs}(\Omega^{(sc)}_-)$ as Lorentz algebra valued Yang-Mills curvature [12, 31].

The action of the Lagrangian (2.2) is invariant under the following supersymmetry transformation rules up to $O(\alpha'^2)$, and cubic fermion terms,

$$
\begin{align*}
\delta e^\mu_r &= \bar{\epsilon} \gamma^r \psi^\mu , \\
\delta \psi^\mu &= D^\mu (\Omega_+) \epsilon - \frac{3}{2} \alpha' \omega^{L}_{\mu \rho \rho} \gamma^{\mu \rho} \epsilon , \\
\delta B_{\mu \nu} &= - \bar{\epsilon} \gamma_{[\mu} \psi_{\nu]} + 2 \alpha' (\Omega_{-\mu}^{\rho} \delta \Omega^{(sc)}_{-\rho \nu rs}) , \\
\delta \chi &= \frac{1}{2} \gamma^\mu \epsilon \partial_\mu \varphi - \frac{1}{12} H_{\mu \nu \rho} \gamma^{\mu \nu \rho} \epsilon + \frac{1}{2} \alpha' \omega^{L}_{\mu \rho \rho} \gamma^{\mu \nu \rho} \epsilon , \\
\delta \varphi &= \bar{\epsilon} \chi .
\end{align*}
$$

The $\alpha'$ dependent terms in $\delta \psi^\mu$ and $\delta \chi$ can be absorbed into to the definition of $H$ by letting $H \to H$ as in (A.15), but we will work with $H = dB$ and exhibit the $\alpha'$ dependent terms explicitly, as we have been doing so far. Furthermore, $\Omega^{(sc)}_{-\mu rs}$ defined in (2.9) transforms under supersymmetry as

$$
\delta \Omega^{(sc)}_{-\mu rs} = - \bar{\epsilon} \gamma_{\mu} \psi_{rs} .
$$

3 The set up for dimensional reduction

We shall study the ordinary dimensional reduction on $T^4$. From here on, we put hats on all the fields and indices of $10D$ fields, and decompose the indices as $\hat{\mu} = (\mu, \alpha)$ and $\hat{r} = (r, a)$ where $\mu, r = 0, 1, \ldots, 5$ and $\alpha, a = 1, \ldots, 4$. For further notation and conventions, see appendix A. As we truncate supersymmetry from $(1,1)$ to $(1,0)$, we take the $10D$ vielbein to be

$$
\hat{e}^{\hat{\mu}}_{\hat{r}} = \left( e^{\mu}_r \ 0 \\
0 \ E^{a}_\alpha \right) ,
$$

where off-diagonal vector components have been set to zero. As a result, the nonvanishing components of $\hat{\omega}^{\hat{\mu}}_{\hat{r}\hat{s}}$ are

$$
\hat{\omega}^{\hat{\mu}}_{\hat{r}\hat{s}} = \omega_{\mu rs} , \\
\hat{\omega}^{\hat{\mu}}_{\hat{r}ab} = \tilde{Q}^{\hat{\mu}}_{\hat{r}ab} , \\
\hat{\omega}^{\hat{\mu}}_{\hat{r}a\alpha} = - E^{b}_\alpha \tilde{P}^{\hat{r}ab} ,
$$

where

$$
\tilde{Q}^{\hat{\mu}}_{\hat{r}ab} := E^{a}_|\alpha| \partial^\mu E^{|a|\alpha} , \\
\tilde{P}^{\hat{r}ab} := E^{a}_|\alpha| \partial^\mu E^{|a|\alpha} .
$$

The nonvanishing Riemann tensor components are

$$
\begin{align*}
\hat{R}^{\hat{\mu}}_{\hat{r}\hat{s}\hat{a}\hat{b}}(\hat{\omega}) &= R^{\mu rs}_{\nu ab}(\omega) , \\
\hat{R}^{\hat{\mu}}_{\hat{r}\hat{a}\hat{b}}(\hat{\omega}) &= \tilde{Q}^{\hat{\mu}}_{\hat{r}ab} , \\
\hat{R}^{\hat{\mu}}_{\hat{r}\hat{a}\hat{b}}(\hat{\omega}) &= - D^\mu (\Gamma) \tilde{P}^{\hat{r}ab} - \tilde{X}^{\hat{\mu}}_{\hat{r}ab} , \\
\hat{R}^{\hat{\mu}}_{\hat{a}\hat{b}\hat{s}}(\hat{\omega}) &= \tilde{Q}^{\hat{r}ab} , \\
\hat{R}^{\hat{\mu}}_{\hat{a}\hat{b}}^{\hat{c}}(\hat{\omega}) &= - 2 \tilde{P}^{\hat{a}a}_{|\alpha|} \tilde{P}^{\hat{b}b}_{|\alpha|} .
\end{align*}
$$
where
\[
\tilde{Q}_{\mu ab} := \partial_\mu \tilde{Q}_{\nu ab} + \tilde{Q}_{\mu ac} \tilde{Q}^{c}_{\nu cb} - (\mu \leftrightarrow \nu),

\tilde{X}_{\mu ab} = \tilde{P}_{\mu a}^c \tilde{P}_c^{\nu b},

D_\mu (\Gamma) \tilde{P}_{\nu ab} = \partial_\mu \tilde{P}_{\nu ab} - \Gamma^{\rho}_{\mu \nu} \tilde{P}_{\rho ab} + \tilde{Q}_{\mu ac} \tilde{P}_{\nu cb} + \tilde{Q}_{\mu bc} \tilde{P}_{\nu ac}.
\] (3.5)

The 10D scalar curvature is
\[
\hat{R} = R - 2D_\mu \tilde{P}_{\mu a}^a - \tilde{P}_{\mu ab} \tilde{P}^{\mu ab} - \tilde{P}_{\mu a}^a \tilde{P}_{\mu b}^b.
\] (3.6)

We also decompose the 2-form potential as
\[
\hat{B}_{\hat{\mu} \hat{\nu}} = (B_{\mu \nu}, B_{\mu \alpha} = 0, B_{\alpha \beta}).
\] (3.7)

Its field strength \(\hat{H}_{\hat{\mu} \hat{\nu} \hat{\rho}}\) has the only non-vanishing components
\[
\hat{H}_{\mu \nu \rho} = \hat{H}_{\mu \nu \rho} := 3\partial_{[\mu} B_{\nu \rho]} ,

\hat{H}_{\mu \alpha \beta} = \partial_\mu B_{\alpha \beta}.
\] (3.8)

In order to uncover the parametrization of the coset
\[
Gr(4, 4) = \frac{SO(4, 4)}{SO(4)_+ \times SO(4)_-},
\] (3.9)

by scalar fields other than the dilaton, we introduce the \(SO(4, 4)\)-valued field
\[
V = \begin{pmatrix} V_{a}^\alpha V_{a}^\alpha \\ V_{a}^{\alpha \alpha} V_{a}^\alpha \end{pmatrix} = \begin{pmatrix} E_{a}^\alpha -2E_{a}^\beta B_{\beta \alpha} \\ 0 \end{pmatrix},
\] (3.10)

which satisfies \(V^T \eta V = \eta\), where \(\eta = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}\). This parametrization of the vielbein is in a triangular gauge, and it is preserved only by the diagonal subgroup of \(SO(4)_+ \times SO(4)_-\). The associated Maurer-Cartan form is
\[
V \partial_\mu V^{-1} = \begin{pmatrix} E_{a}^\alpha \partial_\mu E_{a}^\alpha \\ 0 \end{pmatrix} 2E_{a}^\alpha E_{b}^\beta \partial_\mu B_{\alpha \beta} \begin{pmatrix} -E_{b}^\alpha \partial_\mu E_{a}^\alpha \\ 0 \end{pmatrix}.
\] (3.11)

It is convenient to change the basis such that \(W = \rho^T V \rho\) where \(\rho = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 & -1 \\ 1 & 1 \end{pmatrix}\), diagonalizes \(\eta\) as \(\rho^T \eta \rho = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}\). In this basis the \(SO(4)_+ \times SO(4)_-\) transformations act in a block diagonal form, and the Maurer-Cartan form is given by
\[
W \partial_\mu W^{-1} = \begin{pmatrix} Q_{+\mu ab} -P_{\mu ab} \\ -P_{\mu ba} Q_{-\mu ab} \end{pmatrix},
\] (3.12)

where
\[
Q_{\pm \mu ab} = E_{a}^\alpha \partial_\mu E_{a | b}^\alpha \pm E_{a}^\alpha E_{b}^\beta \partial_\mu B_{\alpha \beta},

P_{\mu ab} = E_{a}^\alpha \partial_\mu E_{a | b}^\alpha - E_{a}^\alpha E_{b}^\beta \partial_\mu B_{\alpha \beta}.
\] (3.13)
It follows from these equations that

\[ Q_{+\mu ab} - Q_{-\mu ab} = -2P_{\mu [ab]} . \]  

(3.14)

This relation, and (3.13) from which it follows, are both valid in the partially gauged fixed parametrization of the vielbein given in (3.10). Undoing the gauge fixing, the resulting Maurer-Cartan form gives \( Q_{\pm \mu ab} \) that are the composite connections associated with \( \text{SO}(4)_\pm \), and \( P_{\mu ab} \) transforms under \( \text{SO}(4)_\pm \) as

\[ \delta P_{\mu ab} = \Lambda_{+a}^c P_{\mu cb} + \Lambda_{-b}^c P_{\mu ac} . \]  

(3.15)

The equations (3.13) play central role in uncovering the \( \text{SO}(4,4) \) symmetry of the dimensionally reduced action, through the use of the relations they imply such as

\[ E_a^\alpha \partial_\mu E_{\alpha b} = Q_{+\mu ab} + P_{\mu ab} , \quad 2E_a^\alpha E_b^\beta \partial_\mu B_{\alpha \beta} = -2P_{\mu [ab]} . \]  

(3.16)

Other key relations follow from the Maurer-Cartan equation

\[ d(WdW^{-1}) + WdW^{-1} \wedge WdW^{-1} = 0 , \]

which gives

\begin{align*}
Q_{+\mu\nu ab} &= -2P_{[\mu|a}^c P_{\nu]|c} , \\
Q_{-\mu\nu ab} &= -2P_{[\mu|a}^c P_{\nu]|c} .
\end{align*}

(3.17)

where

\[ Q_{+\mu\nu ab} := 2\partial_{[\mu|Q_{+\nu]|a}b + 2Q_{+\mu|a}^c Q_{+\nu]|c} , \]

\[ Q_{-\mu\nu ab} := 2\partial_{[\mu|Q_{-\nu]|a}b + 2Q_{-\mu|a}^c Q_{-\nu}|c} . \]  

(3.18)

Note also the identities

\begin{align*}
\partial_\mu E_a^\alpha + Q_{+\mu a}^b E_a^b &= P_{\mu b}^a E_a^b , \\
\partial_\mu E_a^\alpha + Q_{-\mu a}^b E_a^b &= P_{\mu b}^a E_a^b .
\end{align*}

(3.19)

Turning to the fermionic fields, we write \( \text{SO}(1,9) \) gamma matrices \( \hat{\gamma}^m \) as

\[ \hat{\gamma}^m = \gamma^m \otimes 1 \]  

\[ (m = 0, 1, \cdots, 5) , \]

\[ \hat{\gamma}^{a+5} = \gamma_{\gamma} \otimes \gamma^a \]  

\[ (a = 1, 2, 3, 4) , \]  

(3.20)

where \( \gamma^m \) and \( \gamma^a \) are \( \text{SO}(1,5) \) and \( \text{SO}(4) \) gamma matrices respectively, and \( \gamma_{\gamma} \) is the \( \text{SO}(1,5) \) chirality matrix. The \( \text{SO}(1,9) \) chirality matrix is

\[ \hat{\gamma}_{11} = \gamma_{\gamma} \otimes \gamma_5 . \]  

(3.21)

\[ ^3\text{The general matrix } V \text{ satisfying the conditions } V^T \eta V = \eta \text{ can be obtained from } V \text{ given in (3.10) by applying a } \text{SO}(4)_+ \times \text{SO}(4)_- \text{ transformation which is not in the diagonal SO(4) subgroup.} \]
where $\gamma_5$ is the SO(4) chirality matrix. SO(4) gamma matrices and chirality matrix can be represented as

$$
\gamma^a = \begin{pmatrix}
0 & i(\sigma^a)_{AB'} \\
-i(\bar{\sigma}^a)^{AB} & 0
\end{pmatrix} \quad (A, B = 1, 2, A', B' = 1, 2),
$$

$$
\gamma_5 = \gamma^1 \gamma^2 \gamma^3 \gamma^4 = \begin{pmatrix}
\delta_{AB} & 0 \\
0 & -\delta_{A'B'}
\end{pmatrix},
$$

where

$$
\sigma^a = (\sigma^1, \sigma^2, \sigma^3, i), \quad \bar{\sigma}^a = (\sigma^1, \sigma^2, \sigma^3, -i).
$$

A general 10D spinor has components

$$
\hat{\psi} = \begin{pmatrix}
\psi_A \\
\psi_{A'}
\end{pmatrix}.
$$

In dimensional reduction we truncate the spinor fields as

$$
\hat{\psi}_\mu = \begin{pmatrix}
\hat{\psi}_{\mu A} \\
0
\end{pmatrix}, \quad \hat{\psi}_\alpha = \begin{pmatrix}
0 \\
\hat{\psi}_{A'}^\alpha
\end{pmatrix}, \quad \hat{\chi} = \begin{pmatrix}
\hat{\chi}_A \\
0
\end{pmatrix}, \quad \hat{\epsilon} = \begin{pmatrix}
\hat{\epsilon}_A \\
0
\end{pmatrix}.
$$

The 10D chirality conditions imply the following 6D chiralities

$$
\gamma_7 \hat{\psi}_{\mu A} = +\hat{\psi}_{\mu A}, \quad \gamma_7 \hat{\psi}_\alpha^{A'} = -\hat{\psi}_\alpha^{A'}, \quad \gamma_7 \hat{\chi}_A = -\hat{\chi}_A, \quad \gamma_7 \hat{\epsilon}_A = +\hat{\epsilon}_A.
$$

The 6D spinor fields are defined as

$$
\psi_{\mu A} = \hat{\psi}_{\mu A}, \quad \psi_{A'}^\alpha = E_b^a \hat{\psi}_\alpha^{A'}, \quad \chi_A = \hat{\chi}_A - \frac{1}{2}(\sigma^a)_{AB'} \psi_{B'}^A, \quad \epsilon_A = \hat{\epsilon}_A.
$$

In what follows, we will use the notation

$$
\Gamma^a := \gamma_7 \otimes \gamma^a, \quad \{\Gamma^a, \gamma^\mu\} = 0.
$$

The indices $A, A'$ are raised and lowered as

$$
\psi^A = \epsilon^{AB} \psi_B, \quad \psi_A = \psi_{B'}^B \epsilon_{BA'}, \quad \epsilon^{AB} = \epsilon_{AB} = \begin{pmatrix}
0 & 1 \\
-1 & 0
\end{pmatrix}
$$

and similar equations with primed indices $A', B'$. The 10D Dirac conjugate is

$$
\bar{\psi} = \psi^A i \gamma^0 = \left((\psi_A)^\dagger i \gamma^0, (\psi_{A'})^\dagger i \gamma^0\right) = \left(\bar{\psi}^A, -\bar{\psi}_{A'}\right),
$$

where 6D Dirac conjugates are defined as

$$
\bar{\psi}^A = (\psi_A)^\dagger i \gamma^0, \quad \bar{\psi}_{A'} = (\psi_{A'})^\dagger i \gamma^0.
$$

The 10D Majorana condition is

$$
\hat{\psi} = C_{10} \bar{\psi}^T,
$$
where $C_{10}$ is an SO(1, 9) charge conjugation matrix satisfying

$$C_{10}^{-1} \gamma^m C_{10} = -\gamma^m T, \quad C_{10}^T = -C_{10}.$$  \hfill (3.33)

For the representation of $\hat{\gamma}^m$ in (3.20) $C_{10}$ can be chosen as

$$C_{10} = C_6 \otimes C_4,$$  \hfill (3.34)

where $C_6$ and $C_4$ are SO(1, 5) and SO(4) charge conjugation matrices respectively satisfying

$$C_6^{-1} \gamma^m C_6 = -\gamma^m T, \quad C_6^T = C_6,$$

$$C_4^{-1} \gamma^a C_4 = \gamma^a T, \quad C_4^T = -C_4.$$  \hfill (3.35)

The explicit form of $C_4$ is

$$C_4 = \begin{pmatrix} -\epsilon_{AB} & 0 \\ 0 & -\epsilon_{A'B'} \end{pmatrix}, \quad C_4^{-1} = \begin{pmatrix} \epsilon^{AB} & 0 \\ 0 & \epsilon_{A'B'} \end{pmatrix}.$$  \hfill (3.36)

The 10D Majorana condition (3.32) on (3.24) implies 6D symplectic Majorana conditions

$$\psi^A = \epsilon^{AB} C_6 \bar{\psi}^T_B, \quad \psi^{A'} = \epsilon^{A'B'} C_6 \bar{\psi}^T_{B'}. $$  \hfill (3.37)

In this notation, we have, for example,

$$\Gamma^a \psi^b = -\sigma^a \psi^b, \quad \Gamma^a \epsilon = \bar{\sigma}^a \epsilon.$$  \hfill (3.38)

Note also the ‘flipping’ property

$$\bar{\psi}_1 \Gamma^{a_1 \ldots a_n} \gamma^{\mu_1 \ldots \mu_m} \psi_2 = (-1)^{n+m} \bar{\psi}_2 \gamma^{\mu_m \ldots \mu_1} \Gamma^{a_n \ldots a_1} \psi_1,$$  \hfill (3.39)

where $\psi_1$ and $\psi_2$ are any two symplectic Majorana-Weyl spinors in 6D.

### 4 Dimensional reduction of $\mathcal{L}_0$

From the 10D supertransformations (2.12) we obtain the 6D supertransformations at zeroth order in $\alpha'$ as

$$\delta_0 e^m_\mu = \bar{\epsilon} \gamma^m \psi_\mu,$$

$$\delta_0 \psi_\mu = D_\mu (\Omega_+) \epsilon,$$

$$\delta_0 B_{\mu\nu} = -\bar{\epsilon} \gamma_{[\mu} \psi_{\nu]},$$

$$\delta_0 \chi = \frac{1}{2} \gamma^\mu \epsilon \partial_\mu \varphi - \frac{1}{12} H_{\mu
u\rho} \gamma^{\mu\nu\rho} \epsilon,$$

$$\delta_0 \varphi = \bar{\epsilon} \chi,$$

$$W \delta_0 W^{-1} = \begin{pmatrix} 0 & -\bar{\epsilon} \Gamma_a \psi_b \\ -\bar{\epsilon} \Gamma_b \psi_a & 0 \end{pmatrix},$$

$$\delta_0 \psi_a = -\frac{1}{2} \gamma^\mu \Gamma^a_\mu \epsilon P_{\mu\beta a}, $$  \hfill (4.1)
where we have defined the 6D dilaton $\varphi$ as
\[ \varphi = \phi + \frac{1}{2} \ln E, \quad E = \det E_{\alpha}{}^{a}, \quad (4.2) \]
and the covariant derivative on $\epsilon$ is given by
\[ D_{\mu}(\Omega_{+})\epsilon = \left( \partial_{\mu} + \frac{1}{4} \Omega_{+\mu mn} \gamma^{mn} + \frac{1}{4} Q_{+\mu ab} \Gamma^{ab} \right) \epsilon \quad (4.3) \]
We have suppressed the connection $Q_{+}$ in the covariant derivative $D_{\mu}(\Omega_{+})\epsilon$, in accordance with our notational convention described in appendix A. The supertransformations of the hyperscalars are obtained by using
\[ \delta_{0}E_{\alpha}{}^{a} = \epsilon \Gamma^{a}_{\alpha}, \quad \delta_{0}B_{\alpha\beta} = -\epsilon \Gamma_{[\alpha \psi_{\beta]}}. \quad (4.4) \]
To begin with this gives
\[ W \delta_{0}W^{-1} = \begin{pmatrix} -2\epsilon \Gamma_{[\alpha]} & -\epsilon \Gamma_{\alpha} \\ -\epsilon \Gamma_{\alpha} & 0 \end{pmatrix}. \quad (4.5) \]
We can add a compensating $SO(4)$ transformation $\delta_{SO(4)}$ such that $W \delta W^{-1}$ takes values only in the coset direction:
\[ W(\delta_{0} + \delta_{SO(4)})W^{-1} = \begin{pmatrix} -2\epsilon \Gamma_{[\alpha]} & -\epsilon \Gamma_{\alpha} \\ -\epsilon \Gamma_{\alpha} & 0 \end{pmatrix} \]
\[ = \begin{pmatrix} 0 & -\epsilon \Gamma_{\alpha} \\ -\epsilon \Gamma_{\alpha} & 0 \end{pmatrix}, \quad (4.6) \]
where we have chosen the $SO(4)$ transformation parameter as $\lambda_{+ab} = -2\epsilon \Gamma_{[\alpha]}$. In (4.1), we have denoted this result as $W \delta_{0}W^{-1}$ for short. Other fields which transform under $SO(4)$ are fermi fields, for which this compensating transformation is higher order in fermi fields and can be ignored. $B_{\mu\nu}$ transforms only under $SO(4)_{-}$. For later convenience, let us also record the supertransformations
\[ \delta_{0}Q_{-\mu ab} = 2P_{\mu\gamma} \epsilon \Gamma^{c}_{\gamma} \psi_{\eta}, \]
\[ \delta_{0}Q_{+\mu ab} = 2P_{\mu\gamma} \epsilon \Gamma_{[\gamma]}^{c} + 2D_{\mu}(Q_{+}, Q_{-})(\epsilon \Gamma_{[\gamma]}^{c}) \]
\[ = 2P_{\mu\gamma} \epsilon \Gamma_{\gamma}^{c} + 2D_{\mu}(Q_{+}, Q_{-})(\epsilon \Gamma_{\gamma}^{c}), \]
\[ \delta_{0}P_{ab} = D_{\mu}(Q_{+}, Q_{-})(\epsilon \Gamma_{a} \psi_{b}) + 2\epsilon \Gamma_{[\gamma]}^{c} P_{\mu\gamma}. \quad (4.7) \]
The covariant derivatives are defined as
\[ D_{\mu}(Q_{+}, Q_{-})(\epsilon \Gamma_{b} \psi_{a}) = \partial_{\mu}(\epsilon \Gamma_{b} \psi_{a}) + Q_{+\mu cb}(\epsilon \Gamma_{c} \psi_{a}) + Q_{-\mu ac}(\epsilon \Gamma_{b} \psi_{c}), \]
\[ D_{\mu}(Q_{+}, Q_{-})(\epsilon \Gamma_{b} \psi_{a}) = \partial_{\mu}(\epsilon \Gamma_{b} \psi_{a}) + Q_{+\mu cb}(\epsilon \Gamma_{c} \psi_{a}) + Q_{-\mu ac}(\epsilon \Gamma_{b} \psi_{c}). \quad (4.8) \]
\[ \delta_{0}Q_{-\mu ab} \] has the right $SO(4)_{+} \times SO(4)_{-}$ index structure. $\delta_{0}Q_{+\mu ab}$ has undesirable index structures in the first line. But it can be written as in the second line, in which the first term has the right index structure and the second term is a local $SO(4)_{+}$ transformation. So, if
we add a compensating SO(4)_+ transformation with the same parameter λ_{+ab} as in (4.6) to the supertransformation so that the second term is cancelled, we obtain the right index structure. The second term of δ_0 P_{µab} has a undesirable index structure but it is also a local SO(4)_+ transformation with the same parameter as for δ_0 Q_{+µab}. Supertransformations of the truncated components automatically vanish

\[ \delta_0 \left( \tilde{e}_\mu^a, \tilde{e}_\alpha^m, \tilde{B}_\mu^{a}, \tilde{\psi}_\mu^A, \tilde{\psi}_\alpha^A, \tilde{\chi}_\alpha^A \right) = 0, \tag{4.9} \]

which shows the consistency of the truncation from (1,1) to (1,0) supersymmetry.

Using the ingredients described in considerable detail above, it is now straightforward to perform the dimensional reduction of the two-derivative Lagrangian \( L_0 \) given in (2.3), which yields the 6D Lagrangian

\[
L_0 = ee^{2\varphi} \left[ \frac{1}{4} R + g^{\mu\nu}\partial_\mu\varphi\partial_\nu\varphi - \frac{1}{12} H_{\mu\nu\rho}H^{\mu\nu\rho} - \frac{1}{4} P_{\muab}P^{\muab} - \frac{1}{2} \psi_\mu^\alpha \gamma^{\mu\nu} \bar{D}_\nu \psi_\mu - \frac{1}{2} \psi_\mu^\alpha \gamma^{\mu\nu} \bar{D}_\nu \psi_\mu - \frac{1}{2} \psi_\mu^\alpha \gamma^{\mu\nu} \bar{D}_\nu \psi_\mu \right]
\]

The definitions of the covariant derivatives occurring above are listed in appendix A. In obtaining the 6D Lagrangian, we have also used the relations

\[
D_\mu(\omega, \tilde{Q}) \psi_\alpha = E^a_\alpha D_\mu(\omega, \tilde{Q}) \psi_a + \tilde{P}^a_\mu b E_a^b \psi_a,
\]

\[
\tilde{P}^a_\mu = E^{-1} \partial_\mu E,
\]

\[
G_{\alpha\beta} := E^a_\alpha E^a_\beta,
\]

\[
P_{\muab} = \tilde{P}_{\muab} - E^a_\alpha E^b_\beta \partial_\mu E_{\alpha\beta}. \tag{4.11} \]

We conclude by emphasizing that the 6D Lagrangian (4.10) and supertransformations (4.1) are manifestly SO(4,4) invariant, as well as SO(4)_+ × SO(4)_- symmetric. The lowest order bosonic field equations are

\[
\mathcal{E}_\varphi = \frac{1}{2} R(\varphi) - 2 \Box \varphi - 2(\partial_\mu \varphi) (\partial^\mu \varphi) - \frac{1}{6} H_{\mu\nu\rho}H^{\mu\nu\rho} - \frac{1}{2} P_{\muab}P^{\muab},
\]

\[
\mathcal{E}_\mu^\nu = \frac{1}{4} R_{\mu\nu}(\omega) - \frac{1}{4} (D_\mu(\Gamma)\partial_\nu \varphi) - \frac{1}{4} H_{\mu\rho\sigma}H^{\rho\sigma} - \frac{1}{4} P_{\muab}P_\nu^{\ab} - \frac{1}{4} \mathcal{E}_\varphi g_{\mu\nu},
\]

\[
\mathcal{B}_{\mu\nu} = D_\mu(e^{2\varphi} H_{\mu\nu}),
\]

\[
\mathcal{E}^a_{\mu} = D_\mu(e^{2\varphi} P_{\muab}), \tag{4.12} \]

where \( \mathcal{E}_\varphi, \mathcal{E}_\mu^\nu, \mathcal{B}_{\mu\nu}, \) and \( \mathcal{E}^a_{\mu} \) are dilaton field equation, Einstein equation, B-field equation,
and hyperscalar field equation respectively. The lowest order fermionic field equations are
\[
\mathcal{E}_\chi = \gamma^\mu D_\mu (\omega) \chi + \frac{1}{2} \gamma^{\mu \nu} D_\mu (\omega) \psi_\nu + \frac{1}{4} \gamma^{\mu \nu} \Gamma^a \psi^b P_{\mu ab} + \gamma^\mu \chi \partial_\mu \varphi - \frac{1}{2} \gamma^\mu \gamma^\nu \psi_\mu \partial_\nu \varphi + \frac{1}{24} \gamma^{\mu \nu \rho} \psi_\sigma H_{\mu \nu \rho}, \\
\mathcal{E}_\psi = \gamma^{\mu \nu} D_\nu (\omega) \psi_\mu + 2 \gamma^\nu D_\nu (\omega) \chi - \frac{1}{2} \gamma^\nu \gamma^\rho \Gamma^a \psi^b P_{\rho ab} - \gamma^{\mu \nu} \psi_\mu \partial_\nu \varphi + 4 \gamma^\mu \chi \partial_\nu \varphi + \gamma^\nu \psi_\rho \partial_\mu \varphi - \gamma^\mu \psi_\rho \partial_\nu \varphi + 2 \gamma^\nu \gamma^\rho \chi \partial_\mu \varphi + \frac{1}{12} \gamma^{\rho \sigma \tau} \gamma^\mu \psi_\rho \partial_\nu \varphi + \frac{1}{12} \gamma^{\mu \nu \rho} \gamma^\rho \psi_\sigma H_{\mu \nu \sigma} - \frac{1}{6} \gamma^{\mu \nu \rho} \psi_\sigma H_{\mu \nu \rho}, \\
\mathcal{E}_a = \gamma^\mu D_\mu (\omega) \chi_a + \frac{1}{2} \gamma^\mu \gamma^\nu \Gamma^b \psi_\mu P_{\nu ba} + \gamma^\mu \Gamma^b \chi P_{\mu ba} + \gamma^\mu \psi_a \partial_\mu \varphi + \frac{1}{12} \gamma^{\mu \nu \rho} \psi_a H_{\mu \nu \rho},
\]
where \( \mathcal{E}_\chi, \mathcal{E}_\psi, \) and \( \mathcal{E}_a \) are \( \chi \)-field equation, gravitino field equation, and hyperino field equation respectively.

5 Dimensional reduction of \( \mathcal{O}(\alpha') \) terms

5.1 Building blocks

We begin by the dimensional reduction of the \( H \)-torsionful Lorentz connection
\[
\hat{\Omega}_{\pm \hat{\mu} \hat{\nu} \hat{\rho} \hat{\sigma}} = \omega_{\mu \nu \rho} \pm \hat{H}_{\mu \nu \rho},
\]
where \( \hat{\omega} = \hat{\omega}(\hat{e}) \) and \( \hat{H} = d\hat{B} \). Its dimensional reduction gives the only nonvanishing components
\[
\hat{\Omega}_{\pm \mu \nu \rho} = \omega_{\mu \nu \rho} \pm H_{\mu \nu \rho}, \\
\hat{\Omega}_{\pm \mu \nu} = Q_{\pm \mu \nu}, \\
\hat{\Omega}_{\pm \alpha \nu} = -E_{\alpha \beta} P_{\nu \beta}, \\
\hat{\Omega}_{- \alpha \nu} = -E_{\alpha \beta} P_{\nu \beta},
\]
where \( \omega = \omega(e) \) and \( H = dB \). It follows that the only nonvanishing components of the 10\( D \) Riemann tensor for \( \hat{\Omega}_- \) are
\[
\hat{R}_{\mu \nu \rho \sigma} (\hat{\Omega}_-) = R_{\mu \nu \rho \sigma} (\Omega_-), \\
\hat{R}_{\mu \nu \rho \sigma} (\hat{\Omega}_-) = Q_{- \mu \nu \rho \sigma}, \\
\hat{R}_{\mu \nu \rho \sigma} (\hat{\Omega}_-) = -D_\mu (\Gamma_+) P_{\nu \rho \sigma} - X_{\mu \nu \rho \sigma}, \\
\hat{R}_{\nu \mu \rho \sigma} (\hat{\Omega}_-) = Q_{+ \nu \mu \rho \sigma}, \\
\hat{R}_{\nu \mu \rho \sigma} (\hat{\Omega}_-) = -2 P_{[\mu}^{\alpha} P_{\nu \rho] \sigma}^\alpha d,
\]
where
\[
D_\mu (\Gamma_+) P_{\nu \rho \sigma} = \partial_\mu P_{\nu \rho \sigma} - \Gamma_{+ \mu \nu}^\rho P_{\rho \sigma} + Q_{+ \mu \alpha}^\rho P_{\nu \rho \sigma} + Q_{- \mu \rho}^\sigma P_{\nu \nu \sigma}, \\
X_{\mu \nu \rho \sigma} := P_{\mu \nu}^\alpha P_{\nu \rho \sigma}^\alpha,
\]
and \( \Gamma_{\pm \mu \nu}^\rho = \Gamma_{\mu \nu}^\rho \pm H_{\mu \nu}^\rho \). We shall often adhere to the convention in which the dependence of \( Q_{\pm} \) in covariant derivatives will be suppressed if they act normally on the \( \text{SO}(4)_+ \times \text{SO}(4)_- \) indices as above.
Next, we consider the dimensional reduction of the 10D Lorentz Chern-Simons form
\[ \hat{\omega}_{\hat{\mu}\hat{\nu}\hat{\rho}}^{L} = \text{tr} \left( \hat{\Omega}_{-}^{\hat{\mu}} \hat{\partial}_{\hat{\nu}} \hat{\Omega}_{-}^{\hat{\rho}} + \frac{2}{3} \hat{\Omega}_{-}^{\hat{\mu}} \hat{\Omega}_{-}^{\hat{\nu}} \hat{\Omega}_{-}^{\hat{\rho}} \right). \] (5.5)

Its only nonvanishing components are
\[ \hat{\omega}_{\mu
u}^{Q} = \omega_{\mu
u}^{Q}(Q_{-}) + \omega_{\mu
u}^{Q}(Q_{-}), \]
\[ \hat{\omega}_{\mu
u}^{L} = \frac{2}{3} P_{\mu a} \epsilon^{\hat{a}P_{\nu}bc} (D_{\mu} \Gamma_{+}^{P_{\nu}bc} + X_{\mu
u}^{bc}) \bigg|_{\{ab\}}, \] (5.6)
where
\[ \omega_{\mu
u}^{Q}(Q_{-}) = \text{tr} \left( Q_{-}^{\hat{\mu}} \hat{\partial}_{\hat{\nu}} Q_{-}^{\hat{\rho}} + \frac{2}{3} Q_{-}^{\hat{\mu}} Q_{-}^{\hat{\nu}} Q_{-}^{\hat{\rho}} \right). \] (5.7)

We see that the Chern-Simons form built out of the composite local connection \( Q_{-\mu
u} \) naturally arises as a result of the dimensional reduction.

The building blocks for the fermionic Lagrangian at \( \mathcal{O}(\alpha') \) are as follows. Components of \( \hat{\psi}_{\bar{m}n} \) defined in (2.10) decompose in 6D as
\[ \hat{\psi}_{rs} = \psi_{ra} := 2D_{[r}(\Omega_{+}, Q_{+})\psi_{s]}, \]
\[ \hat{\psi}_{ra} = E_{a}^{\alpha} D_{r}(\Omega_{+}, Q_{+})\psi_{\alpha} + \frac{1}{2} P_{\mu ba} \gamma^{b} \psi_{r}, \]
\[ = D_{r}(\Omega_{+}, Q_{+}, Q_{-})\psi_{a} + P_{\mu ba} \gamma^{b} \psi_{r}, \]
\[ \hat{\psi}_{ab} = -P_{\mu [a} \gamma^{b} \Gamma^{c} \psi_{b]}, \] (5.8)
and the components of \( \hat{D}_{\mu}(\hat{\omega}, \hat{\Omega}_{-})\hat{\psi}_{r} \) in 6D are
\[ \hat{D}_{\mu}(\hat{\omega}, \hat{\Omega}_{-})\hat{\psi}_{r} = D_{\mu}(\omega, \Omega_{-})\psi_{r} + \frac{1}{4} P_{\mu ab} \Gamma^{ab} \psi_{r}, \]
\[ \hat{D}_{\mu}(\hat{\omega}, \hat{\Omega}_{-})\hat{\psi}_{a} = D_{\mu}(\omega)\psi_{a} + \frac{1}{4} P_{\mu cd} \Gamma^{cd} \psi_{a}, \]
\[ \hat{D}_{\mu}(\hat{\omega}, \hat{\Omega}_{-})\hat{\psi}_{b} = -\frac{1}{2} P_{\mu(ab)} \gamma^{b} \psi_{r} - P_{rab} \psi_{b}, \]
\[ \hat{D}_{\mu}(\hat{\omega}, \hat{\Omega}_{-})\hat{\psi}_{b} = -\frac{1}{2} \gamma^{a} \Gamma^{c} P_{\mu[ac]} \psi_{b} + P_{\mu ab} \psi_{a}. \] (5.9)

where
\[ D_{\mu}(\omega, \Omega_{-})\psi_{r} = \left( \partial_{\mu} + \frac{1}{4} \omega_{\mu pq} \gamma^{pq} + \frac{1}{4} Q_{+\mu ab} \Gamma^{ab} \right) \psi_{r} + \Omega_{-\mu} \gamma_{s} \psi_{s}. \] (5.10)

5.2 The bosonic Lagrangian at \( \mathcal{O}(\alpha') \)

The first contribution to the bosonic Lagrangian at \( \mathcal{O}(\alpha') \) from (2.4) and (2.5) reduces as
\[ -\frac{1}{4} \tilde{e} e^{2\varphi} \tilde{R}_{\hat{\mu}\hat{\nu}\hat{\rho}\hat{\sigma}}(\hat{\Omega}_{-}) \tilde{R}^{\hat{\mu}\hat{\nu}\hat{\rho}\hat{\sigma}}(\hat{\Omega}_{-}) \]
\[ = e e^{2\varphi} \left[ -\frac{1}{4} R_{\mu
u mn}(\Omega_{-}) R^{\mu
u mn}(\Omega_{-}) - \frac{1}{4} Q_{+\mu
u ab} Q_{+}^{\mu\nu ab} - \frac{1}{4} Q_{-\mu
u ab} Q_{-}^{\mu\nu ab} \right. \]
\[ - \left( D_{\mu}(\Gamma_{+}) P_{\nu ab} + X_{\mu\nu ab} \right) \left( D^{\mu}(\Gamma_{+}) P^{\nu ab} + X^{\mu\nu ab} \right) \]
\[ - \frac{1}{2} Y_{\mu\nu} Y_{ab}^{\mu\nu} + \frac{1}{2} Z_{\mu\nu ab} Z_{ab}^{\mu\nu}, \] (5.11)
where
\[ Y_{\mu
u} := P_{\mu}{}^{ab} P_{\nu ab}, \quad Z_{\mu\nu} := P_{\mu ca} P_{\nu cb}, \]
and the only other contribution to the bosonic Lagrangian at \( O(\alpha') \) from (2.4) and (2.5) reduces as
\[
\hat{\epsilon} e^{2\hat{\phi}} \hat{H}^{\mu\nu} \hat{\Omega}^{L}_{\mu\nu} = ee^{2\hat{\phi}} \left[ H^{\mu\nu}(\omega^{L}_{\mu\nu} + \omega^{Q}_{\mu\nu}) + X^{\mu\nu}(D_{\mu}(\Gamma_{+})P_{\nu ab} + X_{\mu\nu}) \right. \\
\left. - Z^{\mu\nu}(D_{\mu}(\Gamma_{+})P_{\nu ab} + X_{\mu\nu}) \right].
\]
Combining the two results we get
\[
\mathcal{L}_{B} \bigg|_{O(\alpha')} = \hat{\epsilon} e^{2\hat{\phi}} \left[ \hat{H}^{\mu\nu} \hat{\Omega}^{L}_{\mu\nu} - \frac{1}{4} \hat{R}^{\mu\nu\rho\sigma}(\hat{\Omega}_{+}) \hat{R}^{\mu\nu\rho\sigma}(\hat{\Omega}_{+}) \right]
\]
\[
= ee^{2\hat{\phi}} \left[ H^{\mu\nu}(\omega^{L}_{\mu\nu} + \omega^{Q}_{\mu\nu}) - \frac{1}{4} R^{\mu\nu\rho\sigma}(\Omega_{+}) R^{\mu\nu\rho\sigma}(\Omega_{+}) - \frac{1}{4} Q_{+\mu\nu} Q_{+\mu\nu} \right. \\
\left. - \frac{1}{4} Q_{-\mu\nu} Q_{-\mu\nu} - D_{\mu}(\Gamma_{+}) P_{\nu ab} D_{\mu}(\Gamma_{+}) P_{\nu ab} - \frac{1}{2} Y_{\mu\nu} Y_{\mu\nu} + \frac{1}{2} Z_{\mu\nu} Z_{\mu\nu} \right. \\
\left. + \Delta \mathcal{L}_{B} \right],
\]
where
\[
\Delta \mathcal{L}_{B} = - P_{\mu a} D_{\mu} Y_{ab} - X_{ab} Y_{ab}, \quad X_{ab} := P_{\mu a} c P_{\mu c}, \quad Y_{ab} := P_{\mu a} c P_{\mu b}.
\]
Note that \( Y_{ab} \) transforms as an SO(4)+ tensor, and the \( Q_{+} \) connections acting on its indices have been suppressed. We have separated the terms called \( \Delta \mathcal{L}_{B} \) because they are the only terms in (5.14) that are not invariant under SO(4)+ \times SO(4)−. These terms break SO(4)+ \times SO(4) down to the diagonal SO(4). They will be removed by a field redefinition which will also produce a SO(4)+ \times SO(4)− invariant term \(-ee^{2\hat{\phi}} Z_{\mu\nu} Z_{\mu\nu} \), as will be shown in the next subsection.

In obtaining (5.14) we have used the relations
\[ (X^{\mu\nu} + Z^{\mu\nu}) D_{\mu} P_{\nu ab} = P_{\mu a} c P_{\nu cb}, \quad Z^{\mu\nu} X_{\mu\nu} = X^{\mu a} Y_{ab}. \]

We shall continue by reducing the fermionic Lagrangian at \( O(\alpha') \) as well, and collecting all such problematic terms that break the SO(4)+ \times SO(4)− symmetry. The total of such terms will be called \( \Delta \mathcal{L}_{F} \) below. At the end we shall find the field redefinitions of the hyperscalar and hyperfermions which will remove \( \Delta \mathcal{L}_{B} + \Delta \mathcal{L}_{F} \) completely, and producing few new terms that are SO(4)+ \times SO(4)− invariant.

### 5.3 The fermionic Lagrangian at \( O(\alpha') \)

In addition to the definitions for the covariant derivatives given in (5.4) and (5.10), in what follows it is understood that
\[ D_{\mu} \bar{\psi}_{a} = D_{\mu}(\Omega_{+}) \bar{\psi}_{a} = \left( \partial_{\mu} + \frac{1}{4} \Gamma_{+\mu rs}^{\gamma rs} + \frac{1}{4} Q_{+\mu cd} \Gamma_{cd} \right) \bar{\psi}_{a} + Q_{-\mu a} \bar{\psi}_{b}, \]
\[ D_{\mu} P_{\mu ab} = D_{\mu}(\Gamma_{+}) P_{\mu ab} = \partial_{\mu} P_{\mu ab} - \Gamma_{+\mu} P_{\mu ab} + Q_{+\mu c} P_{\nu cb} + Q_{-\mu c} P_{\nu ac}. \]
where $\Gamma_{\mu\nu\rho} = \Gamma_{\mu\nu}\gamma^\rho + H_{\mu\nu\rho}$ and $\Gamma_{\mu\nu}$ is the Christoffel symbol. Thus, we suppress the connections $Q_{+}$ in the covariant derivatives, if their action on the $\text{SO}(4)_+ \times \text{SO}(4)_-$ indices is the standard one, as explained in appendix A.

Next, we dimensionally reduce the fermionic Lagrangian at $O(\alpha')$ and in the order they appear in (2.4) and (2.5). Not all terms that result from the dimensional reduction are $\text{SO}(4)_+ \times \text{SO}(4)_-$ invariant. Such terms are invariant only under the diagonal subgroup, and they are collected as $\Delta L_i, i = 1, \ldots, 7$ below.

$$1=\varepsilon^{2\hat{P}}\left[-\hat{H}^{\hat{\mu}\hat{\rho}}\hat{R}_{\hat{\mu}\hat{\rho}}(\hat{\Omega}_-)\psi_{\bar{\hat{\nu}}}\tilde{\gamma}^a\hat{\psi}_a+\psi_{\bar{\hat{\nu}}}\hat{\gamma}_a\hat{\psi}_a\hat{\Omega}_-\cdot\hat{\rho}\cdot\hat{\tau}\cdot\varepsilon^{-2\hat{P}}\hat{D}_\hat{\rho}(\hat{\Gamma})\left(\varepsilon^{2\hat{P}}\hat{H}^{\hat{\mu}\hat{\rho}}\right)\right]$$

$$=-\varepsilon^{2\hat{P}}\left[-\hat{H}_{\mu\nu\rho}(\Omega_--)\psi_{\bar{\nu}}\hat{\gamma}_\mu\psi_\nu+\hat{H}_{\mu\nu\rho}Q_{-\mu\nu}^{ab}\hat{\psi}_a\gamma_\rho\hat{\psi}_b\right.

$$\left.+\left(\tilde{\psi}_{\bar{\nu}}\gamma_\nu\psi_{\nu}+\hat{\omega}_{\mu\nu\rho}(\Omega_-)\tilde{\psi}_{\bar{\nu}}\gamma_\mu\psi_\nu-\hat{\omega}_{\mu\nu\rho}Q_{-\mu\nu}^{ab}\hat{\psi}_a\gamma_\rho\hat{\psi}_b\right)e^{-2\hat{P}}D_{\mu}(\hat{\Gamma})\left(\varepsilon^{2\hat{P}}\hat{H}^{\mu\nu\rho}\right)+\Delta L_1\right].$$

$$2=\varepsilon^{2\hat{P}}\left[\frac{1}{4}\hat{\omega}_{\mu\nu\rho}(\Omega_-)+\hat{\omega}_{\mu\nu\rho}(Q_-)\left(\tilde{\psi}_{\bar{\nu}}\gamma_\nu\psi_{\nu}+\hat{\omega}_{\mu\nu\rho}Q_{-\mu\nu}^{ab}\hat{\psi}_a\gamma_\rho\hat{\psi}_b\right)\right]

$$-\varepsilon^{2\hat{P}}\left[\frac{1}{4}\hat{\omega}_{\mu\nu\rho}(\Omega_-)+\hat{\omega}_{\mu\nu\rho}(Q_-)\left(\tilde{\psi}_{\bar{\nu}}\gamma_\nu\psi_{\nu}+\hat{\omega}_{\mu\nu\rho}Q_{-\mu\nu}^{ab}\hat{\psi}_a\gamma_\rho\hat{\psi}_b\right)\right]P^{a\sigma}_{\sigma}D_{\nu}P_{\sigma a b}+\Delta L_2\right].$$

$$3=\varepsilon^{2\hat{P}}\left[-\hat{R}_{\hat{\rho}\hat{\mu}\hat{\nu}}(\hat{\Omega}_-)(\tilde{\psi}_{\bar{\nu}}\gamma_\nu\psi_{\nu}+\hat{\omega}_{\mu\nu\rho}(\Omega_-))\right]

$$-\varepsilon^{2\hat{P}}\left[-\hat{R}_{\hat{\rho}\hat{\mu}\hat{\nu}}(\hat{\Omega}_-)(\tilde{\psi}_{\bar{\nu}}\gamma_\nu\psi_{\nu}+\hat{\omega}_{\mu\nu\rho}(\Omega_-))\right]P^{a\sigma}_{\sigma}D_{\nu}P_{\sigma a b}+\Delta L_3\right].$$

$$4=\varepsilon^{2\hat{P}}\left[\frac{1}{2}\hat{R}_{\hat{\rho}\hat{\mu}\hat{\nu}}(\hat{\Omega}_-)(\tilde{\psi}_{\bar{\nu}}\gamma_\nu\psi_{\nu}+\hat{\omega}_{\mu\nu\rho}(\Omega_-))\right]

$$-\varepsilon^{2\hat{P}}\left[\frac{1}{2}\hat{R}_{\hat{\rho}\hat{\mu}\hat{\nu}}(\hat{\Omega}_-)(\tilde{\psi}_{\bar{\nu}}\gamma_\nu\psi_{\nu}+\hat{\omega}_{\mu\nu\rho}(\Omega_-))\right]P^{a\sigma}_{\sigma}D_{\nu}P_{\sigma a b}+\Delta L_4\right].$$

$$5=\varepsilon^{2\hat{P}}\left[-\tilde{\psi}_{\bar{\nu}}\hat{\gamma}_{\mu}\hat{D}_{\mu}(\hat{\Omega}_-)(\tilde{\psi}_{\bar{\nu}}\gamma_\nu\psi_{\nu}+\hat{\omega}_{\mu\nu\rho}(\Omega_-))\right]

$$=\varepsilon^{2\hat{P}}\left[-\tilde{\psi}_{\bar{\nu}}\hat{\gamma}_{\mu}\hat{D}_{\mu}(\hat{\Omega}_-)(\tilde{\psi}_{\bar{\nu}}\gamma_\nu\psi_{\nu}+\hat{\omega}_{\mu\nu\rho}(\Omega_-))\right]P^{a\sigma}_{\sigma}D_{\nu}P_{\sigma a b}+\Delta L_5\right].$$
The terms in (5.19) can be absorbed into the CS terms in (5.21) can be absorbed into the Riem

Furthermore, $D_\mu \psi_a$ and $D_\mu P_{\mu ab}$ are as defined in (5.17) and (5.18) and

The terms in (5.19) can be absorbed into the CS terms in $H_{\mu \nu \rho}$ occurring in $\mathcal{L}_0$, if we use supercovariant $\tilde{Q}_-$ and $\tilde{Q}_-$ and $\tilde{Q}_-$. The first term in (5.21) can be absorbed into the Riem$(\Omega_-)^2$ term upon supercovariantization of $\Omega_-$. The two 10$D$ terms in (5.23) are reduced together for the
following reason. The covariant derivative in the first term becomes $D_\mu(\omega, Q, \Omega_-, Q_-)$ in 6D. When we add the $H_{\mu ab}$ contributions of the second term to the first term, the covariant derivative becomes $D_\mu(\omega, Q_+, \Omega_-, Q_-)$, as $Q$ in the first term combines with $H_{\mu ab}$ in the second term and becomes $Q_+$. Summing all the $SO(4)_+ \times SO(4)_-$ breaking terms found above, while a large number of cancellations occur, we are still left with several terms given by

$$\Delta L = \Delta L_1 + \Delta L_2 + \Delta L_3 + \Delta L_4 + \Delta L_5 + \Delta L_6 + \Delta L_7$$

$$= 2\bar{\psi}\gamma^a \Gamma^b (X_\mu c P_{\mu c}) + 2\bar{\psi}\gamma^a \Gamma^b (P^\mu_a c D_\mu P_{\mu c})$$

$$+ 2\bar{\psi}\gamma^a \Gamma^b \bar{\psi} \psi^{bc} e^{-2\sigma} Di(x\Gamma) (e^{2\varphi} P^{\mu ab}) - 2\bar{\psi}\gamma^a \Gamma^b \bar{\psi} \psi^{bc} D_i (e^{2\varphi} P^{\mu ac})$$

$$- 2\bar{\psi}\gamma^a \Gamma^b \bar{\psi} \psi^{bc} D_\mu P_{\mu c} - 2(\bar{\psi}\gamma^a \Gamma^b \psi^{bc}) X_\mu E_{\mu c} + 2\bar{\psi}\gamma^a \Gamma^b \psi^{bc} P_{\mu c}$$

$$+ 2(\bar{\psi}\gamma^a \Gamma^b \gamma^\mu \chi) (P^{\mu c} D_\mu P_{\mu c})$$

$$+ \left( -\frac{1}{2} \bar{\psi} \gamma^a \gamma^\mu \gamma^\nu \gamma^\sigma \bar{\psi} \psi^{d} - 2\bar{\psi} \gamma^a \gamma^\mu \gamma^\nu \bar{\psi} \psi^{d} + 2\bar{\psi} \gamma^a \gamma^\mu \gamma^\nu \bar{\psi} \psi^{d} + 2\bar{\psi} \gamma^a \gamma^\mu \gamma^\nu \bar{\psi} \psi^{d} \right) Y_{ac \mu bc}$$

$$+ 2\bar{\psi} \gamma^a \gamma^\mu \gamma^\nu \gamma^\sigma \bar{\psi} \psi^{d} (P_{\mu c} Y_{ac \nu cd})$$

$$+ \bar{\psi} \gamma^a \gamma^\mu \gamma^\nu \gamma^\sigma \bar{\psi} \psi^{d} \left( -2P^{\mu c} Y_{ac \nu bd} + P_{\mu c} X_{ac \mu bd} \right)$$

$$- 2(\bar{\psi} \gamma^a \gamma^\mu \gamma^\nu \gamma^\sigma \bar{\psi} \psi^{d}) P_{\mu ab} - 2(D^\mu \bar{\psi} \gamma^a \gamma^\nu \gamma^\sigma \bar{\psi} \psi^{d}) P_{\mu ab}$$

$$- 2\bar{\psi} \gamma^a \gamma^\mu \gamma^\nu \gamma^\sigma \bar{\psi} \psi^{d} (D_\mu (\omega, \Omega_-) \psi^{bc}) Y_{ac \mu bd}$$

$$+ 2\bar{\psi} \gamma^a \gamma^\mu \gamma^\nu \gamma^\sigma \bar{\psi} \psi^{d} (D_\mu \psi^{bc}) Y_{ac \mu bd} - 2\bar{\psi} \gamma^a \gamma^\mu \gamma^\nu \gamma^\sigma \bar{\psi} \psi^{d} \left( -2P^{\mu c} Y_{ac \mu bd} + P_{\mu c} X_{ac \mu bd} \right)$$

$$- \frac{1}{6} H_{\mu \nu \rho} \left( 2\bar{\psi} \gamma^a \gamma^\mu \gamma^\nu \gamma^\sigma \bar{\psi} \psi^{d} (D_\sigma \psi^{ab}) P_{\sigma bc} \right)$$

$$+ \bar{\psi} \gamma^a \gamma^\mu \gamma^\nu \gamma^\sigma \bar{\psi} \psi^{d} (D_\sigma \psi^{ab}) P_{\sigma bc} + \bar{\psi} \gamma^a \gamma^\mu \gamma^\nu \gamma^\sigma \bar{\psi} \psi^{d} (D_\sigma \psi^{ab}) P_{\sigma bc}$$

$$+ \bar{\psi} \gamma^a \gamma^\mu \gamma^\nu \gamma^\sigma \bar{\psi} \psi^{d} (D_\sigma \psi^{ab}) P_{\sigma bc} + \bar{\psi} \gamma^a \gamma^\mu \gamma^\nu \gamma^\sigma \bar{\psi} \psi^{d} Y_{ab} \right).$$

(5.26)

6 Field redefinitions and the total Lagrangian

Combining the results for $\Delta L_B$ and $\Delta L_F$ given (5.15) and (5.26), respectively, with the Lagrangian generated by the field redefinitions in $L_0$ described in appendix B, most remarkably we find that

$$ee^{2\varphi} (\Delta L_B + \Delta L_F) + \Delta L_0 \bigg|_{E \rightarrow YE} + \Delta L_0 \bigg|_{E \rightarrow YE} + \Delta L_0 \bigg|_{E \rightarrow YE} + \Delta L_0 \bigg|_{E \rightarrow YE} + \Delta L_0 \bigg|_{E \rightarrow YE}$$

$$= ee^{2\varphi} \left[ -Z_{\mu ab} Z_{\mu ab} + \left( \bar{\psi} \gamma^a \gamma^\mu \gamma^\nu \gamma^\sigma \bar{\psi} \psi^{d} (D_\mu \psi^{ab}) \right) P_{\mu c} Y_{ac \mu bd} - \bar{\psi} \gamma^a \gamma^\mu \gamma^\nu \gamma^\sigma \bar{\psi} \psi^{d} \left( P_{\mu c} Y_{ac \mu bd} \right) \right].$$

(6.1)

All terms displayed in (5.15) and (5.26), which are only invariant under the diagonal $SO(4)$ subgroup, have cancelled as a result of the field redefinitions, and a handful new terms are produced that are invariant under $SO(4)_+ \times SO(4)_-$. Putting together all the results described above we obtain

$$L \bigg|_{\Omega(a')} = L_B \bigg|_{\Omega(a')} + \Delta L_0 \bigg|_{E \rightarrow YE} + \Delta L_0 \bigg|_{E \rightarrow YE} + \Delta L_0 \bigg|_{E \rightarrow YE} + \Delta L_0 \bigg|_{E \rightarrow YE} + \Delta L_0 \bigg|_{E \rightarrow YE}.$$
\[
\begin{align*}
+ \delta L_0 &\bigg|_{\psi \to Y \psi} + \delta L_0 &\bigg|_{E \to \psi, \psi, \psi \to P E} \\
= &\alpha' e^{2\tau} \left\{ \left[ H^{\mu
u}(\omega^L_{\mu\nu}(\Omega_\omega) + \omega^Q_{\mu\nu}(Q_\omega)) - \frac{1}{4} R^{\nu\rho\sigma\tau}(\Omega_\omega) R^{\mu\nu\rho\sigma}(\Omega_\omega) - \frac{1}{4} \bar{Q}_{\mu\nu\rho\sigma} Q_{\mu\nu\rho\sigma} \right] - \frac{1}{2} Q_{\mu\nu\rho\sigma} Q_{\mu\nu\rho\sigma} - D_{\mu} P_{\nu\rho\sigma} D_{\mu} P_{\nu\rho\sigma} - \frac{1}{2} Z_{\mu\nu\rho\sigma} Z_{\mu\nu\rho\sigma} \right. \\
&\left. + \left[ - H^{\mu\nu}(\omega^L_{\mu\nu}(\Omega_\omega) + \omega^Q_{\mu\nu}(Q_\omega)) - \frac{1}{2} Q_{\mu\nu\rho\sigma} Q_{\mu\nu\rho\sigma} \right] - \frac{1}{2} \bar{Q}_{\mu\nu\rho\sigma} Q_{\mu\nu\rho\sigma} \right. \\
&\left. + \frac{1}{4} \left( \omega^L_{\mu\nu\rho\sigma}(\Omega_\omega) + \omega^Q_{\mu\nu\rho\sigma}(Q_\omega) \right) \left( \bar{\psi}_\sigma \gamma^\sigma \bar{\gamma}^{\mu\nu\rho\sigma} \gamma_\tau \right) \psi^\tau + 4 \bar{\psi}_\alpha \gamma^\sigma \bar{\gamma}^{\mu\nu\rho\sigma} \psi_\sigma - 4 \bar{\psi}_\sigma \gamma^\sigma \bar{\gamma}^{\mu\nu\rho\sigma} \psi_\sigma + \bar{\psi}_\sigma \gamma^\sigma \bar{\gamma}^{\mu\nu\rho\sigma} \psi_\sigma \right) \\
&\left. \left. + \frac{1}{2} \left( - \bar{\psi}_\sigma \gamma^\sigma \bar{\gamma}^{\mu\nu\rho\sigma} \gamma_\tau \psi_\tau + 4 \bar{\psi}_\sigma \gamma^\sigma \bar{\gamma}^{\mu\nu\rho\sigma} \psi_\sigma - 4 \bar{\psi}_\sigma \gamma^\sigma \bar{\gamma}^{\mu\nu\rho\sigma} \psi_\sigma + \bar{\psi}_\sigma \gamma^\sigma \bar{\gamma}^{\mu\nu\rho\sigma} \psi_\sigma \right) \right|_{\psi \to Y \psi} \bigg|_{E \to \psi, \psi, \psi \to P E}
\end{align*}
\]
The term $-\epsilon\bar{\psi}_{[a}Z_{\mu_{a}b]}\psi_{b}^{\mu}$ and the last four terms arise from the field redefinitions. The sum of $L_{0}$ and the $O(\alpha')$ Lagrangian above can be simplified by the modification of the 3-form field strength by Chern-Simons terms and various supercovariantizations. This is done in appendix C, where the terms in the total Lagrangian are grouped in a systematic way according to their structures.

### 6.1 Supersymmetry transformations at $O(\alpha')$

The dimensional reduction of the supersymmetry transformations at lowest order in $\alpha'$ is given in (4.1). Here, we shall determine the supersymmetry transformations at $O(\alpha')$. In doing so we shall also take into account the field redefinitions discussed in appendix B.

Prior to the field redefinitions, the dimensional reduction up to $O(\alpha')$ gives the supertransformations to cubic terms in fermions as

\[
\delta e_{\mu}^{r} = \tilde{e}^{\gamma} \gamma^{\mu} \psi_{\mu},
\]

\[
\delta \psi_{\mu} = D_{\mu}(\Omega_{+})\epsilon - \frac{3}{2} \alpha' \left[ \omega^{L}_{\mu \rho \sigma}(\Omega_{-}) + \omega^{Q}_{\mu \rho \sigma}(\Omega_{-}) \right] \gamma^{\rho \sigma} \epsilon
\]

\[
- \alpha' P_{\nu c} \left( D_{\mu} P_{\nu \beta c} + X_{\mu} P_{\nu \beta c} \right) \Gamma^{ab} \epsilon,
\]

\[
\delta B_{\mu \nu} = -\tilde{e} \gamma_{[\mu} \psi_{\nu]} + 2\alpha' \Omega_{-\mu \nu \rho s} \delta_{0}^{(sc)} \Omega_{-\nu \rho s} + 2\alpha' Q_{-\mu \nu \alpha b} \delta_{0}^{(sc)} Q_{-\nu \alpha b}^{(sc)},
\]

\[
\delta \chi = \frac{1}{2} \gamma^{\mu} \epsilon_{a} \partial_{\mu} \chi - \frac{1}{12} H_{\mu \nu \rho} \gamma^{\mu \nu \rho} \epsilon + \frac{1}{2} \alpha' \left[ \omega^{L}_{\mu \nu \rho}(\Omega_{-}) + \omega^{Q}_{\mu \nu \rho}(\Omega_{-}) \right] \gamma^{\mu \nu \rho} \epsilon,
\]

\[
\delta \varphi = \tilde{e} \chi,
\]

\[
W \delta W^{-1} = \frac{\left( -2 \epsilon_{a} \gamma^{b} \epsilon_{b} \psi_{a} + 4 \alpha' P_{[a} \epsilon \delta P_{b]c} \psi_{c} \right)}{-\epsilon_{a} \gamma^{b} \epsilon_{b} \psi_{a} + 4 \alpha' P_{[a} \epsilon \delta P_{b]c} \psi_{c}}
\]

\[
- \frac{\left( \epsilon_{a} \gamma^{b} \epsilon_{b} \psi_{a} + 4 \alpha' P_{[a} \epsilon \delta P_{b]c} \psi_{c} \right)}{-\epsilon_{a} \gamma^{b} \epsilon_{b} \psi_{a} + 4 \alpha' P_{[a} \epsilon \delta P_{b]c} \psi_{c}}
\]

\[
\delta \psi_{a} = \frac{1}{2} \gamma^{a} \Gamma^{b} \epsilon P_{\mu a} + 2\alpha' P_{\mu c} \left( D_{\mu} P_{\nu \beta c} + X_{\mu} P_{\nu \beta c} \right) \bigg|_{[ab]} \gamma^{\mu \nu \epsilon} \epsilon,
\]

\[
Q_{[\alpha}^{(sc)} = \Omega_{-\alpha \beta}, \quad \psi_{\gamma} = \psi_{\gamma} \mu_{\mu} \psi_{\mu}, \quad Q_{-\alpha \beta}^{(sc)} = Q_{-\alpha \beta} + \psi_{\gamma} \mu_{\mu} \psi_{\mu}.
\]

For later purposes, let us also record the transformation of $B_{\mu \nu}$ under the $SO(4)_{-}$ transformations:

\[
\delta \Lambda B_{\mu \nu} = 2\alpha' \Lambda_{ab} \partial_{[\mu \nu]} Q_{-\alpha \beta}.
\]

Performing the field redefinition $E_{\alpha}^{a} = E_{\alpha}^{a} + \delta E_{\alpha}^{a}$ with $\delta E_{\alpha}^{a} = -2\alpha' Y_{b}^{a} E_{\alpha}^{b}$, and noting the formula (B.2) that gives

\[
Q_{+\mu a b} = Q_{+\mu a b}^{(sc)} + 4\alpha' P_{\mu [a} \epsilon \delta Y_{b]c} \psi_{c},
\]

\[
Q_{+\mu a b} = Q_{+\mu a b}^{(sc)} + 4\alpha' P_{\mu [a} \epsilon \delta Y_{b]c} \psi_{c}.
\]
we find that

\[
\delta \psi_\mu = D_\mu (\Omega_+, Q'_+) \epsilon - \frac{3}{2} \alpha' \left[ \omega^L_{\mu \nu} (\Omega_-) + \omega^Q_{\mu \nu} (Q_-) \right] \gamma^\nu \epsilon - \alpha' P_{\nu a} c D_\mu P^\nu_{bc} \Gamma^{ab} \epsilon.
\]  

(6.7)

In the last two terms \( Q_- \) and \( P \) can be primed since we are interested only at \( O(\alpha') \) terms. Next, considering the redefinitions \( \psi_a \) specified in appendix B as well, we have the redefined fields

\[
\psi'_a = \psi_a + 2 \alpha' \psi^b Y_{ab} + 2 \alpha' \gamma^\nu \Gamma^b \psi^\mu_{\nu ab} + 4 \alpha' P_{\mu ab} D^\mu (\Omega_+) \psi^b,
\]

(6.8)

\[
E'^a_\alpha = E^a_\alpha + 2 \alpha' E_{ab} Y^{ab} - 4 \alpha' \bar{\psi}^\beta \Gamma^{(a} \psi^b) c E_{ab}.
\]

(6.9)

It is noteworthy that the third term in (6.8) supercovariantizes the derivative in the last term, and the third term in (6.9) supercovariantizes \( Y_{ab} \) up to quartic fermion terms. It follows from (6.8) that

\[
\delta \psi'_a = - \frac{1}{2} \gamma^\mu \Gamma^b c P_{\mu ba} - \alpha' \gamma^\mu \Gamma^b c P_{\mu a} c Y_{ac} - 2 \alpha' \gamma^\mu \Gamma^b c P_{\nu a} c D_\mu P^\nu_{bc} + 2 \alpha' P_{\nu a} c (D_\mu P^\nu_{bc} + X_{\mu bc}) \bigg|_{[ab]} \gamma^\mu \Gamma^b c \epsilon.
\]

(6.10)

In the last three terms \( P_{\mu ab} \), and therefore \( Y_{ab} \) by \( X_{\mu bc} \), can be primed since we are interested in \( O(\alpha') \) terms. Next, using

\[
P'_{\mu ab} = P_{\mu ab} + 2 \alpha' D_\mu Y_{ab} + 2 \alpha' (P_{\mu c} - P_{\nu c}) Y_{ac}
\]

(6.11)

in the first term of (6.10), a number of \( SO(4)_+ \times SO(4)_- \) symmetry breaking terms cancel out, and we end up with the \( O(\alpha') \) result invariant under \( SO(4)_+ \times SO(4)_- \) given by

\[
\delta \psi'_a = - \frac{1}{2} \gamma^\mu \Gamma^b c P_{\mu ba} - \alpha' \gamma^\mu \Gamma^b c P_{\mu a} c Y_{bc}.
\]

(6.12)

Turning to the supertransformation of the hyperscalars,

\[
W' \delta W'^{-1} = \begin{pmatrix} E'_{[a} \delta E'_{b]} + E'_{[a} E'_{b]} \delta B_{\alpha \beta} & -E'_{[a} \delta E'_{\alpha \nu} + E'_{[a} E'_{\alpha \nu} \delta B_{\alpha \beta} \\ -E'_{[a} \delta E'_{\beta \delta} + E'_{[a} E'_{\beta \delta} \delta B_{\alpha \beta} & E'_{[a} \delta E'_{\alpha \beta} - E'_{[a} E'_{\alpha \beta} \delta B_{\alpha \beta} \end{pmatrix},
\]

(6.13)

where we recall that \( B_{\alpha \beta} \) does not undergo any field redefinition. The supertransformation of (6.9) up to \( O(\alpha') \) yields

\[
\delta E'^{a \beta} = E^{a \beta}_\alpha \left( \bar{c} \Gamma_b \psi_a - 2 \alpha' Y_{ac} \bar{c} \Gamma_a \psi_b + 4 \alpha' \bar{c} \Gamma_a \psi_b \right)
\]

(6.14)

+ \( 4 \alpha' P_{\mu (a} c \Gamma_b D^\mu c \psi_r - 2 \alpha' \bar{c} \gamma^\mu \Gamma_{(a} \Gamma^c \psi^r Y_{\mu bc]} \),

while the reduction of the 10D supertransformations gives

\[
\delta B_{\alpha \beta} = E'_{[a} E'_{b]} (\bar{c} \Gamma_a \psi_b - 4 \alpha' P_{\mu (a} c \Gamma_b D_\mu \psi_r - 4 \alpha' Y^c_{(a} \bar{c} \Gamma_a \psi_r c - 2 \alpha' Y_{(a} \psi_b \bar{c} \Gamma_a \Gamma^c \psi^r Y_{\mu bc]}).
\]

(6.15)

Passing over to the primed fields, and up to \( O(\alpha') \), the last two supertransformations take the form

\[
\delta E'^{a \beta} = E'^{a \beta}_\alpha \left( \bar{c} \Gamma^b \psi^{[a} + 4 \alpha' \Gamma^{(a \nu} \psi^r Y_{\mu b]} + 4 \alpha' \bar{c} \Gamma^r \psi^{[a} \Gamma_{\nu b]} c + 4 \alpha' \bar{c} \Gamma_{(a} \psi_r Y^r_{\mu bc]} \right)
\]

+ \( 4 \alpha' \bar{c} \Gamma^{(a \nu} \psi_r Y^r_{\mu b]} + 4 \alpha' \bar{c} \Gamma_{(a} \psi_r Y^r_{\mu b]} c \). 

(6.16)

\[
\delta B_{\alpha \beta} = E'_{[a} E'_{b]} [\bar{c} \Gamma_a \psi_b - 2 \alpha' \bar{c} \Gamma_a \psi_b Y_{ac}] .
\]

(6.17)
In (6.13) the terms in the upper and lower block on the diagonal can be removed by SO(4)\(+\) and SO(4)\(-\) gauge transformations respectively. As for the remaining components in (6.13), using the results for \(\delta E'_a\) and \(\delta B_{\alpha\beta}\) in (6.13), we obtain up to \(\mathcal{O}(\alpha')\) the supertransformation

\[
W'(\delta + \delta_{\text{SO(4)+}} + \delta_{\text{SO(4)-}}) W'^{-1} = \begin{pmatrix} 0 & -\iota \Gamma_a \psi_b' + 2\alpha' \iota \Gamma_a \psi_b' Y_a^c \\ -\iota \Gamma_b \psi_b' + 2\alpha' \iota \Gamma_b \psi_b' Y_b^a & 0 \end{pmatrix}.
\]

(6.18)

The lower right block of (6.13) is

\[
\Lambda_{ab} = E'_{[a} \delta E'_{b]} - E'_{a} E'_b \delta B_{\alpha\beta}
= -4\alpha' \iota \Gamma^c \psi_{b}' Y_a^c + 4\alpha' \iota \Gamma_{[a} \psi_{b} Y_{b}^c + 4\alpha' \iota \Gamma_{[a} (D_{\mu} \psi_{b}') P_{\mu |b}^c
- 2\alpha' \iota \Gamma_{\mu} \Gamma_{[a} \Gamma^c \psi_{b} Y_{\mu|b|c}.
\]

(6.19)

The upper left block of (6.13) is

\[
\Lambda_{ab} = E'_{[a} \delta E'_{b]} + E'_{a} E'_b \delta B_{\alpha\beta}
= 2\iota \Gamma_{[b} \psi_{b} + 4\alpha' \iota \Gamma_{[a} \psi_{b} Y_{b}^c + 4\alpha' \iota \Gamma_{[a} (D_{\mu} \psi_{b}') P_{\mu |b}^c
- 2\alpha' \iota \Gamma_{\mu} \Gamma_{[a} \Gamma^c \psi_{b} Y_{\mu|b|c}.
\]

(6.20)

The compensating SO(4)\(+\) transformation acts on fermions thereby giving higher order in fermion terms which we are neglecting. As for the compensating SO(4)\(-\) transformations, they act on \(B_{\mu\nu}\) but giving rise to quadratic in \(\alpha'\) terms, which we are also neglecting.

### 6.2 Closer look at the bosonic action

Let us have a closer look at the bosonic part of this Lagrangian, which we denote by \(\mathcal{L}_{\text{Bos.},\mathcal{O}(\alpha')}\). Noting that

\[
Q_{+\mu\nu ab} = -2(P_{\mu} P_{\nu}^T)_{[ab]}, \quad Q_{-\mu\nu ab} = -2(P_{\mu} P_{\nu}^T)_{[ab]}, \quad Z_{\mu\nu ab} = (P_{\mu}^T P_{\nu})_{ab},
\]

\[
Y_{\mu\nu} = \text{tr}(P_{\mu} P_{\nu}^T),
\]

it can be written as

\[
\mathcal{L}_{\text{Bos.},\mathcal{O}(\alpha')} = e e^2 F \left[ H^{\mu\nu\rho} (\Omega_+^\rho) + \omega^{Q}_{\mu\nu\rho} (Q_-) \right] - \frac{1}{4} R_{\mu\nu\rho\sigma} (\Omega_-) R^{\mu\nu\rho\sigma} (\Omega_-)
- \text{tr}(D_{\mu} (\Gamma_+) P_{\nu} D_{\mu} (\Gamma_+ P_{\nu}) P_{\nu}) - \frac{1}{2} \text{tr}(P_{\mu} P_{\nu}^T) \text{tr}(P_{\mu} P_{\nu}^T)
- \frac{3}{2} \text{tr}(P_{\mu} P_{\mu}^T P_{\nu} P_{\nu}) - \frac{1}{2} \text{tr}(P_{\mu} P_{\mu}^T P_{\nu} P_{\nu})
+ \frac{3}{2} \text{tr}(P_{\mu} P_{\mu}^T P_{\nu} P_{\nu}) \right].
\]

(6.22)

To compare this result with that of [22], we need to evaluate it on the \(\mathcal{L}_0\)-shell. To begin with, using the fact that

\[
R_{\mu\nu\rho\sigma} (\Gamma_+) = R_{\mu\nu\rho\sigma} (\Gamma) - 2D_{[\mu} (\Gamma) H_{\nu] \rho \sigma} - 2H_{\mu\rho, \nu \sigma},
\]

(6.23)
where $H_{\mu\nu,\rho\sigma} := H_{\mu\nu} H_{\rho\sigma}^T$, we find the following relations

\[
\int e^{2\varphi} R_{\mu\nu\rho\sigma} (\Gamma_+) R^{\mu\nu\rho\sigma} (\Gamma_+) = \int e^{2\varphi} \left[ R_{\mu\nu\rho\sigma} (\Gamma) R^{\mu\nu\rho\sigma} (\Gamma) + 2 R_{\mu\nu\rho\sigma} (\Gamma) H^{\mu\nu,\rho\sigma} \right. \\
- 2 H^{\mu\nu,\rho\sigma} H^{\mu\nu,\rho\sigma} - 2 H^{2\mu\nu} H^{2\mu\nu} - 4 H^{2\mu\nu} \text{tr} (P_{\mu} P_{\nu}^T) - 16 H^{2\mu\nu} E_{\mu\nu} \\
\left. + \left( - 4 H^2 E_{\rho} + 8 H_{\mu\nu\rho} (\partial^\rho \varphi) B^\rho - 4 H_{\mu\nu\rho} D^\mu B^\rho \right) \right], \tag{6.24}
\]

\[
- \int e^{2\varphi} \left( (D_\mu (\Gamma_+) P_{\nu}) \left( D^\mu (\Gamma_+) P^{\nu T} \right) \right) = \int e^{2\varphi} \left[ \text{tr} (P_{\mu} P_{\nu}^T) \left( P_{\mu} P^{\nu T} \right) \right. \\
- \text{tr} (P_{\mu} P_{\nu}^T P_{\mu} P^{\nu T}) - \text{tr} (P_{\mu} P_{\mu}^T P_{\nu} P^{\nu T}) + \text{tr} (P_{\mu} P_{\nu}^T P_{\nu} P^{\nu T}) + \text{tr} (P_{\mu} P_{\mu}^T P_{\nu} P^{\nu T}) \\
\left. + \left( 4 E_{\mu\nu} + \varepsilon_{\rho\mu\nu} \right) \text{tr} (P_{\mu} P_{\nu}^T) + (D_\rho E_{\rho}^{ab} P_{\mu}^{\rho a b} - 2 E_{\rho}^{ab} P_{\mu}^{\rho a b} \partial_\rho \varphi) \right], \tag{6.25}
\]

\[
\int H^{\mu\nu\rho\omega L_{\mu\nu\rho}} (\Omega_-) = \int \left[ H^{\mu\nu\rho\omega L_{\mu\nu\rho}} (\omega) + R_{\mu\nu\rho\sigma} (\Gamma) H_{\mu\nu,\rho\sigma} \right. - \frac{2}{3} H_{\mu\nu,\rho\sigma} H_{\mu\nu,\rho\sigma} \left. \right], \tag{6.26}
\]

where $H^{2}_{\mu\nu} := H_{\mu\rho\sigma} H_{\nu,\rho\sigma}$ and the field equations that follow from $\mathcal{L}_0$ are given in (4.12). Using these relations in (6.22) we find the on $\mathcal{L}_0$-shell result

\[
\mathcal{L}_{\text{Bas.,O}(\alpha')} = e^{2\varphi} \left[ H^{\mu\nu\rho\omega L_{\mu\nu\rho}} (\omega) + \omega_{\mu\rho\nu} (Q-) \right] - \frac{1}{4} R_{\mu\nu\rho\sigma} (\omega) R^{\mu\nu\rho\sigma} (\omega) \\
+ \frac{1}{2} R_{\mu\rho\nu\sigma} H^{\mu\nu,\rho\sigma} + \frac{1}{2} H_{\mu\rho,\nu\sigma} H^{2\mu\nu} - \frac{1}{6} H_{\mu\nu,\rho\sigma} H^{\mu\nu,\rho\sigma} + H^{2\mu\nu} \text{tr} (P_{\mu} P_{\nu}^T) \\
+ \frac{1}{2} \left( P_{\mu} P_{\nu}^T \right) \text{tr} (P_{\mu} P^{\nu T}) - \frac{1}{2} \text{tr} (P_{\mu} P_{\mu}^T P_{\nu} P^{\nu T}) + \frac{1}{2} \text{tr} (P_{\mu} P_{\nu}^T P_{\nu} P^{\nu T}) \\
- \frac{1}{2} \left( P_{\mu} P_{\mu}^T P_{\nu} P^{\nu T} \right). \tag{6.27}
\]

Comparison of this result with that of [22] requires the introduction of the $O(4,4)$ matrix

\[
S = \eta V^T V = \rho W^{-1} \sigma_3 W \rho^{-1}, \quad \eta = \begin{pmatrix} 0 & I \\ I & 0 \end{pmatrix}, \quad \sigma_3 = \begin{pmatrix} I & 0 \\ 0 & -I \end{pmatrix}. \tag{6.28}
\]

It follows that

\[
\partial_\mu S = \rho W^{-1} [W \partial_\mu W^{-1}, \sigma_3] W \rho^{-1} = \rho W^{-1} \begin{pmatrix} 0 & 2 P_{\mu} \\ -2 P_{\mu}^T & 0 \end{pmatrix} W \rho^{-1}. \tag{6.29}
\]

Thus we derive the identities,

\[
\text{tr} (\partial_\mu S \partial_\nu S) = -4 \text{tr} (P_{\mu} P_{\nu}^T) - 4 \text{tr} (P_{\mu}^T P_{\nu}), \\
\text{tr} (\partial_\mu S \partial_\nu S) \text{tr} (\partial^\mu S \partial^\nu S) = 64 \text{tr} (P_{\mu} P_{\nu}^T) \text{tr} (P_{\mu} P_{\nu}^T) \\
\text{tr} (\partial_\mu S \partial_\nu S \partial_\sigma S \partial^\sigma S) = 16 \text{tr} (P_{\mu} P_{\nu} P_{\nu} P_{\mu}^T) + 16 \text{tr} (P_{\mu} P_{\nu} P_{\nu} P_{\mu}^T) \\
\text{tr} (\partial_\mu S \partial_\nu S \partial_\rho S \partial^\rho S) = 32 \text{tr} (P_{\mu} P_{\nu} P_{\nu} P_{\mu}^T) \\
\text{tr} (S \partial_\sigma S \partial_\rho S \partial_\sigma S \partial^\rho S) = 16 \text{tr}(P_{\mu} P_{\nu} P_{\nu} P_{\mu}^T) - 16 \text{tr}(P_{\mu} P_{\nu} P_{\nu}^T P_{\nu} P_{\mu}^T) \tag{6.30}
\]
Using these identities, (6.22) takes the form

\[ 
L_{\text{Bos.}, \mathcal{O}(\alpha')} = e e^{2\varphi} \left\{ H^{\mu\nu\rho} (\omega^L_{\mu\nu\rho}(\omega) + \omega^Q_{\mu\nu\rho}(Q_-)) - \frac{1}{4} R_{\mu\nu mn}(\omega) R^{\mu\nu mn}(\omega) 
+ \frac{1}{2} R_{\mu\nu\rho\sigma} H^{\mu\nu\rho,\sigma} + \frac{1}{2} H^2_{\mu\nu} H^{2\mu\nu} - \frac{1}{6} H_{\mu\nu\rho\sigma} H^{\mu\nu,\rho\sigma} - \frac{1}{8} H^{2\mu\nu} \text{tr}(\partial_\mu S \partial_\nu S) 
+ \frac{1}{32} \left[ \frac{1}{4} \text{tr}(\partial_\mu S \partial_\nu S) \text{tr}(\partial^\mu S \partial^\nu S) - \frac{1}{2} \text{tr}(\partial_\mu S \partial_\nu S \partial^\mu S \partial^\nu S) 
- \text{tr}(S \partial_\mu S \partial^\mu S \partial_\nu S \partial^\nu S) \right] \right\}. 
\]

(6.31)

Finally, we note that the CS form satisfies

\[ d\left[ \omega^Q(\mathcal{Q}_+) + \omega^Q(\mathcal{Q}_-) \right] = 0, \]

(6.32)

which implies

\[ \omega^Q(\mathcal{Q}_+) = -\omega^Q(\mathcal{Q}_-) + d\theta, \]

(6.33)

for some 2-form \( \theta \). With this relation at hand, we find that our result (6.31) agrees with that of [22] in their eq. (7.16), upon setting the vector fields equal to zero, and taking into account the convention differences. Similarly we also find that our results agree with those of [29].

7 Conclusions

Motivated by the exploration of higher derivative couplings of quaternionic Kahler sigma models to \( N = (1,0) \) supergravity in 6D, we have started with heterotic supergravity at \( \mathcal{O}(\alpha') [31] \), and reduced it on \( T^4 \) with a consistent \( N = (1,0) \) supersymmetric truncation. We have found that the manifest rigid GL(4) and composite local SO(4) symmetry gets enhanced to rigid SO(4,4) and composite local SO(4)_+ \times SO(4)_-, with the hyperscalars parametrizing the Grassmannian coset \( \text{Gr}(4,4) \). A series of field redefinitions in the hypermultiplet sector are found to cancel a large number of terms arising in the reduction of the action and supersymmetry transformation rule that have only \( O(4) \) invariance. These results generalize the well known work of Maharana and Schwarz [21] who showed how the \( O(d,d) \) invariance emerges in the bosonic action and at the two-derivative level, and the results of [22, 23] where the \( \mathcal{O}(\alpha') \) terms in the bosonic action were dimensionally reduced. We have also shown that the treatment of the 3-form field strength in heterotic supergravity as torsion part of the spin connection, and the modification of its field strength by Lorentz Chern-Simons form defined in terms of the torsionful spin connection, simplify the reduction considerably. In the resulting 6D Lagrangian, many \( H \) dependent terms are absorbed into a torsionful spin connection, but there exist terms in which the three form field strength appears explicitly.

The cancellations of duality symmetry offending terms is expected in view of Sen’s result based on string field theory [19]. However, the emergence of the duality symmetry

\[ ^* \text{We thank Carmen Nunez for communications on this comparison.} \]
at the field theory level is a nontrivial symmetry enhancement phenomenon, which remains to be better understood. The requirement that the dimensionally reduced supersymmetry transformations take an appropriate form may provide a good start for understanding the field redefinitions in a simpler way. The inclusion of the abelian sector of the Yang-Mills couplings in heterotic supergravity remains to be carried out, and it is expected to give the $O(20, 4)$ symmetry in 6D.

One of the motivations for the current work has been the construction of higher derivative couplings of $N = (1, 0)$ supergravity to hypermultiplets where the hyperscalars parametrize a noncompact quaternionic Kahler sigma model with negative curvature constant. The Grassmannian coset $Gr(n, 4)$ is one of the Wolf spaces that have this property. For $n = 4$ we have shown explicitly here how this coupling emerges from dimensional reduction. The complexity of the result shows that a direct construction of these couplings by means of Noether procedure would be very complicated. Dimensional reduction proves a relatively simpler approach to this problem. However, there are no compactification schemes that we know of for obtaining the higher derivative couplings of the other QK sigma models that are relevant to 6D supergravity couplings. For those cases, apparently we need to resort to the Noether procedure. The results of the current paper provide a guide in writing down an ansatz for the all possible four-derivative couplings in this construction. The consequences of the fact that the structure group in $Gr(n, 4)$ is $SO(n) \times SO(3) \times Sp(1)_{R}$, while in the other Wolf spaces it is either $SU(n) \times U(1) \times Sp(1)_{R}$, or $G \times Sp(1)_{R}$ where $G$ is a particular simple group, remains to be investigated. Ultimately, the Yang-Mills sector is to be included, and $R$-symmetry is to be gauged, in an anomaly-free fashion. The investigation of dyonic string solutions in that framework is expected to play role in the analysis of the consistencies of these theories [10].

Acknowledgments

Special thanks are due to Guillaume Bossard for helpful discussions and for suggesting the dimensional reduction of higher derivative heterotic supergravity. We also thank Katrin Becker, Eric Bergshoeff, Daniel Butter, Falk Hassler, Olaf Hohm, Axel Kleinschmidt, James Liu, Yi Pang and Toine van Proeyen for useful discussions, and Jose Fernandez-Melgarejo and Carmen Nunez for correspondence on the comparison of our results. The work of ES is supported in part by the NSF grants PHY-1803875 and PHYS-2112859, and the work of HC is supported in part by the Mitchel Institute for Physics and Astronomy.

A Notation and conventions

In our conventions the spacetime signature is $(- + + \ldots +)$, and the fields of [31] need to be scaled as follows:

$$\psi_{\mu} \rightarrow \sqrt{2} \psi_{\mu}, \quad \epsilon \rightarrow \sqrt{2} \epsilon, \quad B_{\mu\nu} \rightarrow -\sqrt{2} B_{\mu\nu}, \quad H_{\mu\nu\rho} \rightarrow -\left(\sqrt{2}/3\right) H_{\mu\nu\rho},$$

$$\phi \rightarrow \exp(-2\Phi/3), \quad \omega \rightarrow -\omega, \quad \Omega_{\pm} \rightarrow -\Omega_{\pm}.$$  

(A.1)
We frequently use the definitions
\[
X_{\mu\nuab} := P_{\muac} P_{\nuca}, \quad Y_{\mu\nuab} := P_{\muac} P_{\nubc}, \quad Z_{\mu\nuab} := P_{\muca} P_{\nucb},
\]
\[
X_{\mu\nu} := \delta_{\ab} X_{\mu\nuab}, \quad Y_{\mu\nu} := \delta_{\ab} Y_{\mu\nuab}, \quad Y_{\mu\nu} = \delta_{\ab} Z_{\mu\nuab},
\]
\[
X_{\muab} := g^{\mu\nu} X_{\mu\nuab}, \quad Y_{\muab} := g^{\mu\nu} Y_{\mu\nuab}, \quad Y_{\muab} = g^{\mu\nu} Z_{\mu\nuab}.
\] (A.2)
Thus, \( Y_{\mu\nuab} = -\frac{1}{2} Q_{+\mu\nuab} \) and \( Z_{\mu\nuab} = -\frac{1}{2} Q_{-\mu\nuab} \). The vielbein postulates are
\[
\partial_{\mu} e_{\nu} + \omega_{\mu \nu \rho} e_{\rho} = 0, \quad \partial_{\mu} e_{\nu} + \Omega_{\mu \nu \rho} e_{\rho} = 0,
\] (A.3)
where
\[
\Omega_{\pm \mu \nu \rho} = \omega_{\mu \nu \rho} \pm H_{\mu \nu \rho}, \quad \Gamma_{\pm \mu \nu \rho} = \Gamma_{\mu \nu \rho} \pm H_{\mu \nu \rho}, \quad H_{\mu \nu \rho} = 3 \partial_{[\mu} B_{\nu \rho]} \]. (A.4)
and \( \Gamma_{\mu \nu} \) represents the torsion-free Christoffel symbol. The gamma matrices are covariantly constant,
\[
D_{\mu}(\omega, \Gamma) \gamma_{\nu} = 0, \quad D_{\mu}(\Omega_{\pm}, \Gamma_{\pm}) \gamma_{\nu} = 0.
\] (A.5)
The curvatures are defined as
\[
R_{\mu \nu \rho \sigma}(\omega) \equiv \partial_{\mu} \omega_{\nu \rho \sigma} - \partial_{\nu} \omega_{\mu \rho \sigma} + \omega_{\nu \mu \rho} \omega_{\sigma \rho} - \omega_{\nu \sigma \rho} \omega_{\mu \rho},
\]
\[
R_{\mu \nu \rho \sigma}(\Gamma) \equiv \partial_{\mu} \Gamma_{\nu \rho \sigma} - \partial_{\nu} \Gamma_{\mu \rho \sigma} + \Gamma_{\mu \tau \rho} \Gamma_{\nu \sigma \tau} - \Gamma_{\nu \tau \rho} \Gamma_{\mu \sigma \tau}.
\] (A.6)
The two curvatures are related by
\[
R_{\mu \nu \rho \sigma}(\Gamma_{\pm}) = R_{\mu \nu \rho \sigma}(\omega) \pm 2 D_{[\mu}(\Gamma_{\pm}) H_{\nu] \rho \sigma} + 2 H_{[\mu \rho] \tau} H_{\nu] \sigma \tau}.
\] (A.7)
The curvatures of \( \Gamma_{\pm} \) are related to each other by
\[
R_{\mu \nu \rho \sigma}(\Gamma_{\pm}) = R_{\rho \sigma \mu \nu}(\Gamma_{\mp}).
\] (A.8)
These identities can be easily derived by considering commutator of covariant derivatives acting on vielbein, and make use of (A.3). The curvatures of \( \Gamma_{\pm} \) are related to \( \Gamma \) by
\[
R_{\mu \nu \rho \sigma}(\Gamma_{\pm}) = R_{\mu \nu \rho \sigma}(\Gamma) \mp 2 D_{[\mu}(\Gamma) H_{\nu] \rho \sigma} + 2 H_{[\mu \rho] \tau} H_{\nu] \sigma \tau}.
\] (A.9)
The curvatures of \( \Gamma_{\pm} \) are related to each other by
\[
R_{\mu \nu \rho \sigma}(\Gamma_{\pm}) = R_{\rho \sigma \mu \nu}(\Gamma_{\mp}).
\] (A.10)
We also have the relation
\[
D_{\mu}(\Omega_{-}) P_{\nuab} := \partial_{\mu} P_{\nuab} + \Omega_{- \mu \nu \rho} P_{\rho \sigma} + Q_{+ \mu \nu \rho} P_{\rho \sigma} + Q_{- \mu \nu \rho} P_{\rho \sigma}
\]
\[
= e_{\mu} e_{\nu} D_{\mu}(\Gamma_{+}) P_{\nuab}.
\] (A.11)
with \( D_{\mu}(\Gamma_{+}) P_{\nuab} \) as defined in (5.18), and
\[
D_{\mu}(\Gamma_{+}) P_{\nuab} = -H_{\mu \nu \rho} P_{\rho \sigma}.
\] (A.12)
Finally, our notation for the covariant derivatives is as follows. From section 4 onward, in covariant derivatives we only indicate the connections that act on the Lorentz spinor and
vector indices, and suppress the composite local connections \( Q_\pm \) that act according to the \( \text{SO}(4)_+ \times \text{SO}(4)_- \) representations carried by the fields they act on. When we encounter a term in which this symmetry is broken, we display the composite connections in the covariant derivatives. For reader’s convenience, we list the definition of variety of covariant derivatives that arise in the body of the paper:

\[
D_\mu(\Omega_+)^\epsilon = \left( \partial_\mu + \frac{1}{4} \Omega_{\mu mn} \gamma^{mn} + \frac{1}{4} Q_{+\mu ab} \Gamma^{ab} \right) \epsilon, \\
D_{[\mu}(\omega)\psi_{\nu]} = \left( \partial_{[\mu} + \frac{1}{4} \omega_{[\mu rs} \gamma^{rs} + \frac{1}{4} Q_{+|\mu|ab} \Gamma^{ab} \right) \psi_{|\nu]}, \\
D_\mu(\omega)\chi = \left( \partial_\mu + \frac{1}{4} \omega_{\mu rs} \gamma^{rs} + \frac{1}{4} Q_{+\mu ab} \Gamma^{ab} \right) \chi, \\
D_\mu(\omega)\psi_a = \left( \partial_\mu + \frac{1}{4} \omega_{\mu rs} \gamma^{rs} + \frac{1}{4} Q_{+\mu cd} \Gamma^{cd} \right) \psi_a + Q_{-\mu a} \bar{\psi}_b, \\
D_\mu(\omega, \Omega_-)\psi_r = \left( \partial_\mu + \frac{1}{4} \omega_{\mu pq} \gamma^{pq} + \frac{1}{4} Q_{+\mu ab} \Gamma^{ab} \right) \psi_r + \Omega_{-\mu r} \bar{\psi}_s, \\
D_\mu \psi_a = D_\mu(\Omega_+) \psi_a = \left( \partial_\mu + \frac{1}{4} \Omega_{+\mu rs} \gamma^{rs} + \frac{1}{4} Q_{+\mu cd} \Gamma^{cd} \right) \psi_a + Q_{-\mu a} \bar{\psi}_b, \\
D_\mu P_{\nu ab} = D_\mu(\Gamma_+) P_{\nu ab} = \partial_\mu P_{\nu ab} - \Gamma_{+\mu}{}^{\rho} \Gamma_{\rho ab} + Q_{+\mu a} \hat{P}_{\nu cb} + Q_{-\nu b} \hat{P}_{\mu ca}, \\
D_\mu(\omega, \Omega_-) \psi_r = \left( \partial_\mu + \frac{1}{4} \omega_{\mu pq} \gamma^{pq} + \frac{1}{4} Q_{+\mu ab} \Gamma^{ab} \right) \psi_r + \Omega_{-\mu r} \bar{\psi}_s + \Omega_{-\nu s} \bar{\psi}_p. 
\]

(A.13)

In defining the Chern-Simons modified field strength, in order to adopt the same convention as [22], we perform the field redefinition

\[
B_{\mu \nu} = B_{\mu \nu}^\prime + 3\alpha \theta_{\mu \nu}, 
\]

(A.14)

with \( \theta \) satisfying (6.33). Dropping the prime, this leads to the definition

\[
\mathcal{H}_{\mu \nu \rho} = 3\partial_{[\mu} B_{\nu \rho]} - 6\alpha \left( \Omega_{\mu [\nu} \partial_\rho \Omega_{\rho \mu]}^{(sc)} + \frac{2}{3} \Omega_{\mu [\nu} \Omega_{\rho \mu]}^{(sc)} \Omega_{\rho \mu]}^{(sc)} \right) - 3\alpha \omega_{\mu \rho \nu}^{Q_+}(Q_+) + 3\alpha \omega_{\mu \rho \nu}^{Q_-}(Q_-), 
\]

(A.15)

where

\[
\Omega_{\mu \rho \nu}^{(sc)} = \Omega_{-\mu s} + \bar{\psi}_r \gamma_\mu \psi_s, \\
\omega_{\mu \rho \nu}^{Q_+}(Q_+) = \text{tr} \left( Q_{\pm [\mu} \partial_\nu Q_{\pm \rho]} + \frac{2}{3} Q_{\pm [\mu} Q_{\pm \nu} Q_{\pm \rho]} \right). 
\]

(A.16)

Further supercovariantizations that will be used in appendix C are given by

\[
D^{(sc)}_\mu \psi_a = D_\mu \psi_a + \frac{1}{2} \gamma^\nu \Gamma^{ab} \psi_b P_{\nu ab}, \\
P^{(sc)}_{\mu ab} = P_{\mu ab} - \bar{\psi}_a \Gamma_\mu \psi_b, \\
Y^{(sc)}_{\mu ab} = P^{(sc)}_{\mu ab} P_{\nu (sc) ab}, \\
Q^{(sc)}_{-\mu ab} = -2 P_{[\mu}^{ca} P_{\nu]b (sc)}, \\
Z^{(sc)}_{ab} = P^{(sc)}_{\mu c a} P_{\mu b (sc)}, 
\]

(A.17)

where terms up to quadratic in fermions are to be kept. Note that the dimensional reduction gives \( \Omega_{-\mu ab}^{(sc)} = Q_{-\mu ab} + \bar{\psi}_a \gamma_\mu \psi_b \), where \( Q_{-\mu ab} \) is supercovariant by itself. In fact, \( Q_{+\mu ab} \) is supercovariant by itself as well.
B Field redefinitions

Consider the field redefinition $E_\alpha^a \to E_\alpha^a + \delta E_\alpha^a$ with

$$\delta E_\alpha^a = E_\alpha^b S_{br}^a,$$  \hspace{1cm} (B.1)

where $S_{ab} = S_{ba}$. Under this redefinition,

$$\delta Q_{+\mu ab} = P_{\mu a}^c S_{cb} - P_{\mu b}^c S_{ac},$$
$$\delta Q_{-\mu ab} = P_{\mu a}^c S_{cb} + Q_{+\mu a}^c S_{cb} + Q_{-\mu b}^c S_{ac} = D_\mu (Q_+ S_{ab} + (P_{\mu b}^c - P_{\mu c}^b) S_{ac}).$$  \hspace{1cm} (B.2)

The variation of the zeroth order Lagrangian under this redefinition is

$$\delta L_0 = e e^2 \phi \left[ \left( \frac{1}{8} \bar{\psi}_\nu \gamma^{\mu \nu} \Gamma_{ab} \psi_\rho + \frac{1}{2} \bar{\chi} \gamma^\mu \Gamma_{ab} \chi - \frac{1}{8} \bar{\psi}_\nu \gamma^{\mu \nu} \Gamma_{ab} \psi_\rho + \frac{1}{2} \bar{\chi} \gamma^\mu \Gamma_{ab} \chi \right) - \frac{1}{2} \bar{\psi}_\nu \gamma^\mu \Gamma_{ab} \psi_\rho + \frac{1}{2} \bar{\chi} \gamma^\mu \Gamma_{ab} \chi \right] \delta Q_{+\mu ab}$$
$$- \frac{1}{2} \bar{\psi}_\nu \gamma^\mu \Gamma_{ab} \psi_\rho \delta Q_{-\mu ab} + \frac{1}{2} \left( \bar{\psi}_\nu \gamma^\mu \Gamma_{ab} \psi_\rho + 2 \bar{\chi} \gamma^\mu \Gamma_{ab} \chi \right) \delta P_{\mu ab} - \frac{1}{2} P_{\mu ab} \delta P_{\mu ab}. \hspace{1cm} (B.3)$$

Let us now consider the redefinition

$$S_{ab} = -2 \alpha' Y_{ab}.$$  \hspace{1cm} (B.4)

It gives rise to

$$\delta L_0 \bigg|_{E \to Y E} = \alpha' e e^2 \phi \left[ P_{\mu ab} D_\mu Y_{ab} + X_{ab} Y_{ab} - Z_{\mu ab} Z_{\mu ab} \right] - \left( \bar{\psi}_\nu \gamma^\mu \Gamma_{ab} \psi_\rho + 2 \bar{\chi} \gamma^\mu \Gamma_{ab} \chi \right) \left( P_{\mu a}^c Y_{bc} \right) + \left( \bar{\psi}_\nu \gamma^\mu \Gamma_{ab} \psi_\rho \right) \left( P_{\mu b}^c Y_{ac} \right) \delta Q_{+\mu ab} \left[ \left( \bar{\psi}_\nu \gamma^\mu \Gamma_{ab} \psi_\rho + 2 \bar{\chi} \gamma^\mu \Gamma_{ab} \chi \right) - \left( \bar{\psi}_\nu \gamma^\mu \Gamma_{ab} \psi_\rho \right) \delta Q_{-\mu ab} + \left( \bar{\psi}_\nu \gamma^\mu \Gamma_{ab} \psi_\rho + 2 \bar{\chi} \gamma^\mu \Gamma_{ab} \chi \right) \delta P_{\mu ab} - \frac{1}{2} P_{\mu ab} \delta P_{\mu ab} \right]. \hspace{1cm} (B.5)$$

The term $- e e^2 \phi Z_{\mu ab} Z_{\mu ab}$ and the last two terms are $SO(4)_+ \times SO(4)_-$ invariant. The rest will remove some of the terms that break this symmetry as shown in (6.2). The remaining symmetry breaking terms will be removed by further field redefinitions discussed below.

Next, let us consider the redefinition

$$S_{ab} = 4 \alpha' \bar{\psi}_\nu \gamma^a \Gamma^{(a} \psi_\nu \Gamma^{b c)}.$$  \hspace{1cm} (B.6)

In this case only the last term in (B.3) contributes, giving

$$\delta L_0 \bigg|_{S \text{-terms}} = - \frac{1}{2} e e^2 \phi \left[ P_{\mu ab} D_\mu (Q_+ + Q_-) S_{ab} \right], \hspace{1cm} (B.7)$$

- 27 -
where $Q_+$ rotates the first index and $Q_-$ rotates the second index on $S_{ab}$. Integration by part gives
\[ \delta L_0 \bigg|_{E \to \psi_+ \psi_+ P_E} = 2e \bar{\psi}^a \Gamma^a \psi_+ \frac{e_{ab}}{c} D_{\mu}(e^{2\varphi} P_{ab}) \psi_b. \] (B.8)

Next, we consider the redefinition of the hyperino. The lowest order Lagrangian $L_0$ under a general variation of the hyperino gives
\[ \delta L_0 = e^{2\varphi} \left[ - \frac{1}{2} (\delta \bar{\psi}) \bar{\psi} (\omega) \psi_a - \frac{1}{2} \bar{\psi} \delta \bar{\psi} (\omega) (\delta \psi_a) \right. \]
\[ \left. - \frac{1}{12} H_{\mu \nu \rho} \bar{\psi}^a \gamma_{\mu \nu \rho} \delta \psi_a + \frac{1}{2} P_{ab} \left( \bar{\psi}_b \gamma^a \Gamma^b \delta \psi_a + 2 \bar{\chi} \gamma^b \Gamma^a \delta \psi_b \right) \right]. \] (B.9)

It follows that the field redefinition
\[ \delta \psi_a = -2\alpha^i \psi^b Y_{ab} - 2\alpha^i \gamma^\nu \Gamma^b \psi^\nu Y_{\mu ab} - 4\alpha^i P_{ab} D^\mu \psi^b, \] (B.10)
yields the results
\[ \delta L_0 \bigg|_{\psi \to \psi Y} = \alpha^i e^{2\varphi} \left[ 2Y_{ab} \bar{\psi}^a \bar{\psi} (\omega) \psi_b + \frac{1}{6} H_{\mu \nu \rho} \bar{\psi}^a \gamma_{\mu \nu \rho} \psi_b Y_{ab} \right. \]
\[ \left. - \left( \bar{\psi}_b \gamma^a \Gamma^b \psi^b + 2 \bar{\chi} \gamma^b \Gamma^a \psi^b \right) (P_{ab} Y_{bc}) \right], \] (B.11)
\[ \delta L_0 \bigg|_{\psi \to \psi P P} = \alpha^i e^{2\varphi} \left[ Y_{\mu ab} \bar{\psi}^b \gamma^\nu \gamma^a \Gamma^a D_{\mu} (\omega, \Gamma_+) \psi^\nu + Y_{\mu ab} \bar{\psi}^b \gamma^a \Gamma^b \psi^\nu \bar{\psi} (\omega) \psi^a \right. \]
\[ \left. - \bar{\psi}_b \gamma^a \gamma^\nu \gamma^\nu \Gamma^a \psi^b D_{\mu} Y_{\mu ba} + \frac{1}{6} H_{\mu \nu \rho} \bar{\psi}^a \gamma_{\mu \nu \rho} \gamma^a \Gamma^b \psi^b Y_{\gamma \sigma ab} \right. \]
\[ \left. + \bar{\psi}_b \gamma^a \gamma^\nu \gamma^\nu \Gamma^a \psi^b (P_{\mu ac} Y_{\nu ba}) + 2 \bar{\chi} \gamma^b \gamma^a \Gamma^a \psi^b (P_{\mu bc} Y_{\nu dc}) \right. \]
\[ \left. - \bar{\psi}_b \gamma^a \gamma^\nu \gamma^\nu \Gamma^a \psi^b P_{ab} \gamma^\nu Y_{\mu ca} + \bar{\psi}^a \gamma^\nu \gamma^\nu \Gamma^a \psi^b H_{\mu \nu} \gamma^\nu Y_{\mu ab} \right. \]
\[ \left. - \bar{\psi}^a \gamma^\nu \gamma^\nu \Gamma^a \psi^b (P_{\mu ac} Y_{\nu ba}) \right], \] (B.12)
\[ \delta L_0 \bigg|_{\psi \to \psi PD \psi} = \alpha^i e^{2\varphi} \left[ 2P_{ab} \bar{\psi}^a \bar{\psi} (\omega, \Gamma_+) D^\mu \psi^b + 2 (\bar{\psi}^b \gamma^\nu D^\nu \psi^a) D_{\mu} \psi^b \right. \]
\[ \left. + 2P_{ab} (D^m \bar{\psi}^a) D (\omega) \psi^b + \frac{1}{3} H_{\mu \nu \rho} \bar{\psi}^a \gamma_{\mu \nu \rho} (D_m \psi^b) P^m_{ab} \right. \]
\[ \left. - 2 \bar{\psi} \gamma^a \gamma^\nu \gamma^\nu \Gamma^b \psi^a P_{\mu ba} + 4 \bar{\chi} \gamma^b \gamma^a \Gamma^a \psi^b P_{\mu ba} \right. \]
\[ \left. + 2 \bar{\psi} \gamma^a \gamma^\nu \gamma^\nu \Gamma^b \psi^a X_{\mu ab} - 2 \psi^a \gamma^\nu \gamma^\nu \Gamma^b \psi^b Z_{\mu ab} \right], \] (B.13)

where $\Gamma$ refers to the Christoffel symbol which is torsion-free. The last term in (B.12) and the last term in (B.13) are $SO(4)_+ \times SO(4)_-$ invariant. The rest will remove the remaining symmetry breaking terms, as shown in (6.2). In the above equations we have used the following notations. We have denoted the torsionful connection by $\Gamma \pm = \Gamma \pm H$. In (B.12) we have converted $D_\rho (\Gamma, Q_-, Q_+) Y_{\mu ab}$ in which the connection $Q_-$ acts on the $b$ and $Q_+$ acts on a index, to the standard one $D_\rho (\Gamma_+, Q_+, Q_+) Y_{\mu ab} = D_\rho Y_{\mu ba}$ by adding and subtracting the required terms. In (B.12) we have also converted $D_\rho (\omega, \Gamma) \psi_\nu$ where $\omega$ rotates the spinor
index and $\Gamma$ acts on the vector index of the gravitino, to $D_{\mu}(\omega, \Gamma_+)|\psi_\nu$, again by adding and subtracting the required terms. Similarly, in (B.13), we have converted $\psi(\omega, \Gamma_+)D^\mu\psi^b$ into $\psi(\omega, \Gamma_+)D^\mu\psi^b$, and $D_{\mu}(\Gamma, Q_-, Q_-)P_{\nu ba}$ into $D_{\mu}(\Gamma_+, Q_+, Q_-)P_{\nu ba} = D_{\mu}P_{\nu ba}$, again by adding and subtracting appropriate terms.

C The total Lagrangian in 6D

The lowest order in $\alpha'$ Lagrangian (4.10), which we reproduce here for reader’s convenience, is given by

$$\mathcal{L}_0 = ee^{2\varphi} \left[ \frac{1}{4} R + g^{\mu\nu} \partial_\mu \varphi \partial_\nu \varphi - \frac{1}{12} H_{\mu\nu\rho} H^{\mu\nu\rho} - \frac{1}{4} P_{\mu ab} P^{\mu ab} \right. \\
- \frac{1}{2} \bar{\psi}_\mu \chi^{\mu\nu\rho} D_\nu(\omega) \psi_\rho + 2 \bar{\chi} \chi^{\mu} D_\mu(\omega) \psi_\nu + 2 \bar{\chi} \chi^{\mu} D_\mu(\omega) \chi \\
- \frac{1}{2} \bar{\psi}_\mu \chi^{\mu\nu\rho} D_\nu(\omega) \psi_\rho - \partial_\mu \varphi \left( \bar{\psi}^{\mu\nu} \psi_\nu + 2 \bar{\psi}_\nu \chi^{\mu\nu} \chi \right) \\
+ \frac{1}{2} P_{\mu ab} \bar{\psi}_\mu \chi^{\mu\nu\rho} \Gamma^{\nu\alpha\beta} \chi^{\beta} + 2 \bar{\chi} \chi^{\mu} \Gamma^{\mu\alpha\beta} \chi^{\beta} \right] - \frac{1}{24} H_{\mu\nu\rho} \left( \bar{\psi}^\sigma \gamma^\mu \gamma^{\mu\rho\gamma} \gamma^\tau \psi^\tau \\
+ 4 \bar{\psi}_\sigma \chi^{\sigma \mu \nu \rho} \chi - 4 \bar{\chi} \chi^{\mu \nu \rho} \psi_\alpha \right) \] \hspace{1em} (C.1)

As for the $\mathcal{O}(\alpha')$ Lagrangian (6.2), it can be simplified by performing some algebra of Dirac matrices, the replacement $H \to \mathcal{H}$ in $\mathcal{L}_0$, with $\mathcal{H}$ defined in (A.15), and the use of supercovariantizations defined in (A.16) and (A.17). In that context the following relations are useful:

$$- \frac{1}{12} H_{\mu\nu\rho} H^{\mu\nu\rho} = - \frac{1}{12} H_{\mu\nu\rho} H^{\mu\nu\rho} + \alpha' H^{\mu\nu\rho} \left( \omega^L_{\mu\nu\rho}(\Omega_-) + \frac{1}{2} \omega^Q_{\mu\nu\rho}(Q_-) - \frac{1}{2} \omega^Q_{\mu\nu\rho}(Q_+) \right)$$

$$- \alpha' H^{\mu\nu\rho} R^{rs}_{\mu\nu\rho}(\Omega_-) \bar{\psi}_r \gamma^\rho \psi_s + \alpha' \bar{\psi}_r \gamma_\delta \psi_s \Omega_\rho^{-rs} e^{-2\varphi} D_\mu(\Gamma)(e^{2\varphi} H^{\mu\nu\rho}),$$

$$- \frac{1}{4} \alpha' R^{rs}_{\mu\nu\rho}(\Omega_-^{(sc)}) R^{rs}_{\mu\nu\rho}(\Omega_-^{(sc)}) = - \frac{1}{4} \alpha' R^{rs}_{\mu\nu\rho}(\Omega_-^{(sc)}) R^{rs}_{\mu\nu\rho}(\Omega_-)$$

$$- 2 \alpha' R^{rs}_{\mu\nu\rho}(\Omega_-^{(sc)}) \bar{\psi}^r \gamma^\mu D^\rho(\omega, \Omega_-^{(sc)}) \psi^s, \hspace{1em} (C.2)$$

where $H = dB$. Carrying out the algebra of Dirac matrices to determine the independent structures in order to separate the terms that are amenable to the use of the lowest order field equations, further remarkable simplifications occurs and the total 6D Lagrangian takes the form

$$\mathcal{L} = \mathcal{L}_0 \bigg|_{H \to \mathcal{H}} + \mathcal{L}(R^2) + \mathcal{L}_1 + \mathcal{L}_2 + \mathcal{L}_3 + \mathcal{L}_4 + \mathcal{L}_5 + \mathcal{L}_6, \hspace{1em} (C.3)$$

with $\mathcal{L}_0$ as given in (4.10), and various parts of the Lagrangian are organized according to the structures of the terms they consist of as follows:

$$\mathcal{L}(R^2) = \alpha' ee^{2\varphi} \left[ - \frac{1}{4} R^{rs}_{\mu\nu\rho}(\Omega_-^{(sc)}) R^{rs}_{\mu\nu\rho}(\Omega_-^{(sc)}) - \bar{\psi}_r \gamma^\mu D_\mu(\omega, \Omega_-) \psi_s - \frac{1}{12} H_{\mu\nu\rho} \bar{\psi}_r \gamma^\sigma \gamma^{\mu\rho} \psi_s \\
+ \frac{1}{2} R^{rs}_{\mu\nu}(\Omega_-) (\bar{\psi}_r \gamma^\mu \gamma^\rho - 2 \bar{\chi} \chi^{\mu \rho}) \psi_s \right] \hspace{1em} (C.4)$$
\[ \mathcal{L}_1 = \alpha' e e^2 \rho \left[ - \left( D_{\mu} P^{(sc)}_{\nu \rho} \right) D^{\mu} P^{(sc)}_{\nu \rho} b - \frac{3}{4} Q^{(sc)}_{-\rho \nu \mu} Q^{(sc)}_{-\mu \nu \rho} - \frac{1}{2} Y^{(sc)}_{\mu \nu} Y^{(sc)}_{\mu \nu} \right] \]

\[ \mathcal{L}_2 = \alpha' e e^2 \rho \left[ \left( - \frac{1}{2} \bar{\psi} \gamma^\mu \psi \Gamma^\nu \bar{\psi} - 2 \bar{\psi} \gamma^\mu \Gamma^\nu \bar{\psi} - 2 \bar{\chi} \gamma^\mu \Gamma^\nu \bar{\psi} + \frac{1}{2} \bar{\psi} \gamma^\mu \Gamma^\nu \bar{\psi} \right) P^{\sigma \rho} D_{\mu} P_{\sigma \rho} \right] \]

\[ \mathcal{L}_3 = \alpha' e e^2 \rho \left[ \left( - \frac{1}{2} \bar{\psi} \gamma^\mu \psi \Gamma^\nu \bar{\psi} \right) P^{\nu \rho} D_{\mu} P_{\nu \rho} - 2 \bar{\psi} \gamma^\mu \psi \right] \]

\[ \mathcal{L}_4 = \alpha' e e^2 \rho \left[ \left( - \frac{1}{2} \bar{\psi} \gamma^\mu \psi \Gamma^\nu \bar{\psi} \right) P^{\nu \rho} D_{\mu} P_{\nu \rho} - 2 \bar{\psi} \gamma^\mu \psi \right] \]

\[ \mathcal{L}_5 = \alpha' e e^2 \rho \left[ \left( - \frac{1}{2} \bar{\psi} \gamma^\mu \psi \Gamma^\nu \bar{\psi} \right) P^{\nu \rho} D_{\mu} P_{\nu \rho} - 2 \bar{\psi} \gamma^\mu \psi \right] \]

\[ \mathcal{L}_6 = \alpha' e e^2 \rho H_{\mu \nu} \left[ \frac{1}{12} \bar{\psi} \gamma^\mu \psi \Gamma^{\nu \rho} \Gamma^{\tau \sigma} \gamma^\mu \gamma^\nu \psi \right] - \frac{1}{12} P_{\lambda \rho} P_{\lambda \rho} \bar{\psi} \gamma^\mu \Gamma^{\nu \rho} \gamma^\mu \gamma^\nu \]

where we have used the relation \( D_\mu (\omega, \Gamma_+) \gamma^\nu = -H_{\mu \nu} \gamma^\mu \), and the non-standard covariant derivatives are as defined in (A.13) and

\[ D_\mu (\omega, \Gamma_+) (D_\mu \psi) = \left( \partial_\mu + \frac{1}{4} \omega_{\mu pq} \gamma^p + \frac{1}{4} Q_{\mu abc} \Gamma^{bc} \right) (D_\mu \psi) , \]

\[ + \Omega_{-\mu \nu} \right) (D_\nu \psi) + Q_{-\mu \nu} (D_\mu \psi) . \]

The structures that arise in the result for Lagrangian are grouped as follows. In the first term in (C.3), with \( \mathcal{L}_0 \) from (4.10), only the zeroth and first order in \( \alpha' \) that are to be
kept. In the Lagrangian $\mathcal{L}(R^2)$, the dependence on the hyperscalars enters only through the composite connections in the covariant derivatives. The Lagrangian $\mathcal{L}_1$ contains the bosonic four derivative terms built out of hyperscalars. Denoting a generic fermion by $\psi$, the terms in $\mathcal{L}_2$ schematically are of the form $\bar{\psi}\psi$ (PDP), where the PDP factor cannot be written as $D(PP)$. Thus there is no room for use of equations of motion here. Similarly, $\mathcal{L}_3$ contains terms of the form $\bar{\psi}\psi P^3$ with no room for equations of motion. The Lagrangian $\mathcal{L}_4$ contains terms of the form $P^2 \bar{\psi}D\psi$ or $(DP)\bar{\psi}D\psi$. Terms in which the lowest order in $\alpha'$ field equations can arise directly or upon partial integration are collected in $\mathcal{L}_5$, and the Lagrangian $\mathcal{L}_6$ has the terms in which $H$ appears explicitly, as opposed to entering through covariant derivative as torsion. It is worth noting that many simplifications have occurred by working with the supercovariant derivative of the hyperino $D_{\mu}^{(sc)}\psi_a$ defined in (A.17).

The supertransformations in terms of the redefined fields, including $B'_{\mu\nu}$ given in (A.14), and with primes dropped, are given by

$$
\delta e_\mu^r = \bar{\epsilon} \gamma^r \psi_\mu, \\
\delta \bar{\psi}_\mu = D_\mu (\Omega) \epsilon - \frac{3}{2} \lambda \left[ \omega_{\mu\rho\nu} (\Omega_-) + \frac{1}{2} \omega_{\mu\rho\nu} (Q_-) - \frac{1}{2} \omega_{\mu\rho\nu} (Q_+) \right] \gamma^\mu \epsilon - \lambda' P^a \epsilon D_\mu P_{\nu} \Gamma^{ab} \epsilon, \\
\delta B_{\mu\nu} = -\epsilon \gamma_{[\mu} \psi_{\nu]} + 2\alpha' \Omega_{-}[\mu_{rs} \delta_{[\nu} \Omega_{-]}^{(sc)\rho}s + \alpha' Q_{-}[\mu_{ab} \delta_{[\nu} Q_{-\nu]} ab - \alpha' Q_{-}[\mu_{ab} Q_{-\nu]} ab, \\
\delta \chi = \frac{1}{2} \gamma^\mu \partial_\mu \varphi - \frac{1}{12} H_{\mu\rho\nu} \gamma^\mu \epsilon + \frac{1}{2} \alpha' \left[ \omega_L^L (\Omega_-) + \frac{1}{2} \omega_L^Q (Q_-) - \frac{1}{2} \omega_L^Q (Q_+) \right] \gamma^\mu \epsilon, \\
\delta \varphi = \bar{\epsilon} \chi, \\
W \delta W^{-1} = \begin{pmatrix} 0 & -\partial_\mu \psi_2 + 2\alpha' \Gamma_{\nu} \psi_2 Y_3^c \cr -\partial_{\nu} \psi_3 + 2\alpha' \Gamma_{\nu} \psi_2 Y_3^c & 0 \end{pmatrix}, \\
\delta \psi_a = -\frac{1}{2} \gamma^\mu \Gamma^b_{\mu a} P_{\nu b a} - \alpha' \gamma^\mu \Gamma^b_{\nu a} P_{\mu b a}. 
$$

(C.12)

It is understood that the quartic fermion terms in the action and the cubic fermion terms in the supertransformations are to be dropped.

We find the commutation relation of these supertransformations as

$$
[\delta_1, \delta_2] = \delta_{g.c.}(\xi) + \delta_L(\lambda) + \delta_{\text{tensor}}(\Lambda) + \delta_{\text{SO}(4)}(\Lambda_+) + \delta_{\text{SO}(4)}(\Lambda_-),
$$

(C.13)

where

$$
\xi^\mu = \bar{\epsilon} \gamma^\mu \epsilon_1, \\
\lambda_{rs} = -\xi^\mu \Omega_{-\mu rs} + 6 \alpha' \xi^\mu \left[ \omega_{\mu rs}^{(sc)} (\Omega_-) + \frac{1}{2} \omega_{\mu rs} (Q_-) - \frac{1}{2} \omega_{\mu rs} (Q_+) \right], \\
\Lambda_\mu = \frac{1}{2} \xi^\mu - \xi^\nu B_{\mu \nu}, \\
\Lambda_{\pm ab} = \xi^\mu Q_{\pm ab}. 
$$

(C.14)

To find supertransformation which may appear on the right-hand side of (C.13) we need cubic fermion terms in the supertransformations. In our conventions $\delta_L(\lambda) \epsilon^r = -\lambda' s \epsilon^s$. Note also the transformation rules $\delta B_{\mu \nu} = 2 \partial_{[\mu} \Lambda_{\nu]}$, and those given in (3.15) and (6.5). It
is easy to check (C.13) for $e_{\mu}^{\tau}$ and $\varphi$. To check (C.13) for $B_{\mu\nu}$ we used

$$
\delta_0 \Omega_{-\mu rs}^{(sc)} = -\bar{\epsilon}_\mu \psi_{rs}, \quad \delta_0 Q_{-\mu ab}^{(sc)} = 2P_{\mu [a} \bar{\epsilon} \Gamma^c \psi_{b]} \tag{C.15}
$$

and

$$
[\delta_{01}, \delta_{02}] \Omega_{-\mu rs}^{(sc)} = -\xi^{\nu} R_{\mu rs}^{(\Omega_-)},
[\delta_{01}, \delta_{02}] Q_{-\mu ab}^{(sc)} = -\xi^{\nu} Q_{-\mu ab}. \tag{C.16}
$$

To check (C.13) for $W$ we used

$$
\delta_1 (-\bar{\epsilon}_2 \Gamma_a \psi_b + 2\alpha' \bar{\epsilon}_2 \Gamma_c \psi_b Y_a^c) - (1 \leftrightarrow 2) = -\xi^{\mu} P_{\mu ab} \tag{C.17}
$$

and found

$$
[\delta_1, \delta_2] W^{-1} = W^{-1} \begin{pmatrix} 0 & -\xi \cdot P \\ -\xi \cdot P^T & 0 \end{pmatrix} = \xi^{\mu} \partial_{\mu} W^{-1} - W^{-1} \begin{pmatrix} \xi \cdot Q_+ & 0 \\ 0 & \xi \cdot Q_- \end{pmatrix}, \tag{C.18}
$$

where we have used (3.12) in the second line. We have not checked (C.13) for fermi fields, which needs cubic fermi terms in the supertransformations.
