Abstract: The aim of this paper is to present new sixth order iterative methods for solving nonlinear equations. The derivation of these methods is purely based on variational iteration technique. Our methods are verified by means of various test examples and numerical results show that our developed methods are more effective with respect to the previously well known methods. Finally, polynomiography via our developed method is presented which shows the dynamical behavior of our proposed methods.

1. Introduction

One of the most important problems is to find the values of $x$ which satisfy the equation

$$f(x) = 0.$$  

The solution of these problems has many applications in applied sciences. In order to solve these problems, various numerical methods have been developed using different techniques such as adomian decomposition, Taylor’s series, perturbation method, quadrature formulas and variational iteration technique [1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 15, 16, 17, 19, 20, 21, 22, 23, 24] and the references therein.

One of the most famous and oldest method for solving nonlinear equations is classical Newton’s method which can be written as:

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}, \quad n = 0, 1, 2, .... \quad (1.1)$$

This is an important and basic method, which converges quadratically [2].

Modifications of Newton’s method gave various iterative methods with better convergence order. Some of them are given in [1, 4, 5, 6, 9, 15, 22], and the references therein.

In this paper, we develop three new iterative methods using variational iteration technique. The variational iteration technique was developed by He [8]. Using this technique, Noor and Shah [20] has suggested and analyzed some iterative methods for solving the nonlinear equations. The purpose of this technique was to solve a variety of diverse problems [7, 8]. Now we have applied the described technique to obtain higher-order iterative methods. Our methods are of sixth order convergence. We also discuss the convergence criteria of these new iterative methods. Several examples are given to show the performance of our proposed methods as compare to the other similar existing methods. Via our generated methods, Polynomiographs of different complex polynomials is also presented which are quiet new and reflects the dynamical behavior of our methods.
2. Construction of Iterative Methods using Variational Technique

In this section, we develop some new sixth order iterative methods for solving nonlinear equations. By using variational iteration technique, we develop the main recurrence relation from which we derive the new iterative methods for solving nonlinear equations by considering some special cases of the auxiliary functions \( g \). These are multi-step methods consisting of predictor and corrector steps. The convergence of our methods is better than the one-step methods. Now consider the nonlinear equation of the form

\[
f(x) = 0.
\]

(2.1)

Suppose that \( \alpha \) is the simple root and \( \gamma \) is the initial guess sufficiently close to \( \alpha \). Let \( g(x) \) be any arbitrary function and \( \lambda \) be a parameter which is usually called the Lagrange’s multiplier and can be identified by the optimality condition. Consider the auxiliary function

\[
H(x) = \psi(x) + \lambda [f(\psi(x))g(\psi(x))];
\]

(2.2)

where \( \psi(x) \) is the arbitrary auxiliary function of order \( p \) with \( p \geq 1 \).

Using the optimality criteria, we can obtain the value of \( \lambda \) from (2.2) as

\[
\lambda = -\frac{\psi(x)}{g'(\psi(x))f(\psi(x)) + g(\psi(x))f'(\psi(x))}.
\]

(2.3)

From (2.2) and (2.3), we get

\[
H(x) = \psi(x) - \frac{f(\psi(x))g(\psi(x))}{[f'(\psi(x))g(\psi(x)) + f(\psi(x))g'(\psi(x))]}.
\]

(2.4)

Now we are going to apply (2.4) for constructing a general iterative scheme for iterative methods. For this, suppose that

\[
\psi(x) = y = x - \frac{f(x)}{f'(x)} - \frac{f^2(x)f''(x)}{2f'^3(x)},
\]

(2.5)

which is well known Halley’s method of third order of convergence. With the help of (2.4) and (2.5), we can write

\[
H(x) = y - \frac{f(y)g(y)}{[f'(y)g(y) + f(y)g'(y)]},
\]

(2.6)
If $\alpha$ is the root of $f(x)$, then for $x = \alpha$, we can write

$$\frac{g(y)}{g'(y)} = \alpha - \frac{g(\alpha)}{g'(\alpha)} - \frac{g^2(\alpha)g''(\alpha)}{2g^3(\alpha)} = \frac{g(\alpha)}{g'(\alpha)}. \quad (2.7)$$

Also,

$$\frac{g(x)}{g'(x)} = \frac{g(\alpha)}{g'(\alpha)}. \quad (2.8)$$

With the help of (2.7) and (2.8), we get

$$\frac{g(y)}{g'(y)} = \frac{g(x)}{g'(x)}. \quad (2.9)$$

Using (2.9) in (2.6), we obtain

$$H(x) = y - \frac{f(y)g(x)}{[f'(y)g(x) + f(y)g'(x)]}, \quad (2.10)$$

which enable us to define the following iterative scheme

$$x_{n+1} = y_n - \frac{f(y_n)g(x_n)}{[f'(y_n)g(x_n) + f(y_n)g'(x_n)]}, \quad (2.11)$$

where $y_n = x_n - \frac{f(x_n)}{f'(x_n)} - \frac{f^2(x_n)f''(x_n)}{2f^3(x_n)}$.

Relation (2.11) is the main and general iterative scheme, which we use to deduce iterative methods for solving nonlinear equations by considering some special cases of the auxiliary functions $g$.

### 2.1. Case 1

Let $g(x_n) = e^{\beta x_n}$. Then $g'(x_n) = \beta g(x_n)$. Using these values in (2.11), we obtain the following algorithm.

Using these values in (2.11), we obtain the following algorithm.

**Algorithm 2.1.** For a given $x_0$, compute the approximate solution $x_{n+1}$ by the following iterative schemes:

\[
y_n = x_n - \frac{f(x_n)}{f'(x_n)} - \frac{f^2(x_n)f''(x_n)}{2f^3(x_n)}, \quad n = 0, 1, 2, ...,
\]

\[
x_{n+1} = y_n - \frac{f(y_n)}{[f'(y_n) + \beta f(y_n)]}.
\]
2.2. Case 2

Let $g(x_n) = e^{\beta f(x_n)}$. Then $g'(x_n) = \beta f'(x_n)g(x_n)$. Using these values in (2.11), we obtain the following algorithm.

**Algorithm 2.2.** For a given $x_0$, compute the approximate solution $x_{n+1}$ by the following iterative schemes:

$$y_n = x_n - \frac{f(x_n)}{f'(x_n)} - \frac{f^2(x_n)f''(x_n)}{2f'^3(x_n)}, \quad n = 0, 1, 2, ..., $$

$$x_{n+1} = y_n - \frac{f(y_n)}{[f'(y_n) + \beta f(y_n)f'(x_n)]}.$$

2.3. Case 3

Let $g(x_n) = e^{-\beta f(x_n)}$. Then $g'(x_n) = \beta f'(x_n)g(x_n)$. Using these values in (2.11), we obtain the following algorithm.

**Algorithm 2.3.** For a given $x_0$, compute the approximate solution $x_{n+1}$ by the following iterative schemes:

$$y_n = x_n - \frac{f(x_n)}{f'(x_n)} - \frac{f^2(x_n)f''(x_n)}{2f'^3(x_n)}, \quad n = 0, 1, 2, ..., $$

$$x_{n+1} = y_n - \frac{f^2(x_n)f(y_n)}{[f^2(x_n)f'(y_n) + \beta f'(x_n)f(y_n)]}.$$

By assuming different values of $\beta$, we can obtain different iterative methods. To obtain best results in all above algorithms, choose such values of $\beta$ that make the denominator non-zero and greatest in magnitude.

3. Convergence Analysis

In this section, we discuss the convergence order of the main and general iteration scheme (2.11).

**Theorem 3.1.** Suppose that $\alpha$ is a root of the equation $f(x) = 0$. If $f(x)$ is sufficiently smooth in the neighborhood of $\alpha$, then the convergence order of the main and general iteration scheme, described in relation (2.11) is at least six.

**Proof.** To analysis the convergence of the main and general iteration scheme, described in relation (2.11), suppose that $\alpha$ is a root of the equation $f(x) = 0$.
and \( e_n \) be the error at \( n \)-th iteration. Then \( e_n = x_n - \alpha \) and by using Taylor series expansion, we have

\[
f(x) = f'(\alpha)e_n + \frac{1}{2!}f''(\alpha)e_n^2 + \frac{1}{3!}f'''(\alpha)e_n^3 + \frac{1}{4!}f^{(iv)}(\alpha)e_n^4 + \frac{1}{5!}f^{(v)}(\alpha)e_n^5 \\
+ \frac{1}{6!}f^{(vi)}(\alpha)e_n^6 + O(e_n^{13}),
\]

\[
f(x) = f'(\alpha)[e_n + c_2e_n^2 + c_3e_n^3 + c_4e_n^4 + c_5e_n^5 + c_6e_n^6 + O(e_n^7)], \tag{3.1}
\]

\[
f'(x_n) = f'(\alpha)[1 + 2c_2e_n + 3c_3e_n^2 + 4c_4e_n^3 + 5c_5e_n^4 + 6c_6e_n^5 \\
+ 7c_7e_n^6 + O(e_n^7)], \tag{3.2}
\]

\[
f''(x_n) = f'(\alpha)[2c_2 + 6c_3e_n + 12c_4e_n^2 + 20c_5e_n^3 + 30c_6e_n^4 + 42c_7e_n^5 \\
+ 56c_8e_n^6 + O(e_n^7)], \tag{3.3}
\]

where

\[
c_n = \frac{1}{n!} \frac{f^{(n)}(\alpha)}{f'(\alpha)}.
\]

With the help of (3.1), (3.2) and (3.3), we get

\[
y_n = \alpha + (-c_2 + 2c_2^2)e_n^2 + (12c_2c_3 - 9c_3^2 - 3c_4)e_n^4 \\
+ (15c_3^2 - 63c_3c_2^2 + 30c_2^2 + 24c_2c_4 - 6c_5)e_n^5 \\
+ (-10c_5 + 40c_2c_5 + 55c_4c_3 - 112c_4c_2 - 136c_2c_3^2 \\
+ 251c_3c_2^2 - 88c_5^2)e_n^6 + O(e_n^7), \tag{3.4}
\]

\[
f(y_n) = f'(\alpha)[-c_2 + 2c_2^2)e_n^2 + (12c_2c_3 - 9c_3^2 - 3c_4)e_n^4 \\
+ (15c_3^2 - 63c_3c_2^2 + 30c_2^2 + 24c_2c_4 - 6c_5)e_n^5 \\
+ (-10c_5 + 40c_2c_5 + 55c_4c_3 - 112c_4c_2 - 135c_2c_3^2 \\
+ 247c_3c_2^2 - 84c_5^2)e_n^6 + O(e_n^7)], \tag{3.5}
\]

\[
f'(y_n) = f'(\alpha)[1 + (-2c_2c_3 + 4c_3^2)e_n^3 + (24c_3c_2^2 - 18c_2^2 - 6c_2c_4)e_n^4 \\
+ (30c_2c_3^2 - 126c_3c_2^2 + 60c_2^2 + 48c_4c_2^2 - 12c_2c_5)e_n^5 \\
+ (-20c_2c_6 + 80c_2c_5 + 110c_2c_4c_3 - 224c_4c_2^2 - 284c_2c_3^2 \\
+ 514c_3c_2^4 - 176c_2^6 + 3c_3^3)e_n^6 + O(e_n^7)], \tag{3.6}
\]

\[
g(x_n) = g(\alpha) + g'(\alpha)e_n + g''(\alpha)\frac{e_n^2}{2!} + g'''(\alpha)\frac{e_n^3}{3!} + g^{(4)}(\alpha)\frac{e_n^4}{4!} \\
+ g^{(5)}(\alpha)\frac{e_n^5}{5!} + g^{(6)}(\alpha)\frac{e_n^6}{6!} + O(e_n^7), \tag{3.7}
\]
\[ g'(x_n) = g'(\alpha) + \frac{g''(\alpha)}{2!}c_n^2 + \frac{g'''(\alpha)}{3!}c_n^3 + \frac{g''''(\alpha)}{4!}c_n^4 + \frac{g^{(6)}(\alpha)}{5!}c_n^5 + \frac{g^{(7)}(\alpha)}{6!}c_n^6 + O(e_n^7). \]  

(3.8)

Using equations (3.1)-(3.8) in general iteration scheme (2.11), we get

\[ x_{n+1} = \alpha + \frac{4(-c_2^2 + c_3^2)[g(\alpha)c_2 + g'(\alpha)]}{g(\alpha)}e_6^6 + O(e_n^7), \]

which implies that

\[ e_{n+1} = \frac{4(-c_2^2 + c_3^2)[g(\alpha)c_2 + g'(\alpha)]}{g(\alpha)}e_6^6 + O(e_n^7). \]

The above relation shows that the main and general iteration scheme (2.11) is of sixth order of convergence and all iterative methods deduce from it have also convergence of order six.

4. Numerical Examples

In this section we included some nonlinear functions to illustrate the efficiency of our developed algorithms for \( \beta = 1 \). We compare our developed algorithms with Newton’s method (NM) [2], Ostrowski’s method (OM) [3], Traub’s method (TM) [24], and modified Halley’s method (MHM) [18]. We used \( \varepsilon = 10^{-15} \). The following stopping criteria is used for computer programs:

1. \( |x_{n+1} - x_n| < \varepsilon \).
2. \( |f(x_{n+1})| < \varepsilon \).

Tables 1-7. Shows the numerical comparisons of Newton’s method, Ostrouski’s method, Traub’s method, modified Halley’s method and our developed methods. The columns represent the number of iterations \(N\) and the number of functions or derivatives evaluations \(N_f\) required to meet the stopping criteria, and the magnitude \(|f(x)|\) of \(f(x)\) at the final estimate \(x_n\).

5. Polynomiography

Polynomials are one of the most significant objects in many fields of mathematics. Polynomial root-finding has played a key role in the history of mathematics. It is one of the oldest and most deeply studied mathematical problems. The last interesting contribution to the polynomials root finding history was made by Kalantari [11], who introduced the polynomiography. As a method which generates nice looking graphics, it was patented by Kalantari in 2005 [12]. Polynomiography is defined to be “the art and science of visualization in approximation of the zeros of complex polynomials, via fractal and non fractal images created using the mathematical convergence properties of iteration functions”. [11]. An individual image is called a “polynomiograph”. Polynomiography combines both art and science aspects.
Polynomiography gives a new way to solve the ancient problem by using new algorithms and computer technology. Polynomiography is based on the use of one or an infinite number of iteration methods formulated for the purpose of approximation of the root of polynomials e.g., Newton’s method, Halley’s method, etc. The word “fractal”, which partially appeared in the definition of polynomiography, was coined by the famous mathematician Benoit Mandelbrot [13]. Both fractal images and polynomiographs can be obtained via different iterative schemes. Fractals are self-similar has typical structure and independent of scale. On the other hand, polynomiographs are quite different. The “polynomiographer” can control the shape and designed in a more predictable way by using different iteration methods to the infinite variety of complex polynomials. Generally, fractals and polynomiographs belong to different classes of graphical objects. Polynomiography has diverse applications in math, science, education, art and design. According to Fundamental Theorem of Algebra, any complex polynomial with complex coefficients \( \{a_n, a_{n-1}, ..., a_1, a_0 \} \):

\[
p(z) = a_n z^n + a_{n-1} z^{n-1} + \cdots + a_1 z + a_0
\]

or by its zeros (roots) \( \{r_1, r_2, ..., r_{n-1}, r_n \} \):

\[
p(z) = (z - r_1)(z - r_2) \cdots (z - r_n)
\]

of degree \(n\) has \(n\) roots (zeros) which may or may not be distinct. The degree of polynomial describes the number of basins of attraction and placing roots on the complex plane manually localization of basins can be controlled.

Usually, polynomiographs are colored based on the number of iterations needed to obtain the approximation of some polynomial root with a given accuracy and a chosen iteration method. The description of polynomiography, its theoretical background and artistic applications are described in [11, 12, 14].

### 5.1. Iteration

During the last century, the different numerical techniques for solving nonlinear equation \(f(x) = 0\) have been successfully applied. Now we define our developed algorithms as

\[
y_n = x_n - \frac{2f(x_n)f'(x_n)}{2f^2(x_n) - f(x_n)f''(x_n)}, \quad n = 0, 1, 2, ...
\]

\[
x_{n+1} = y_n - \frac{f^2(x_n)f'(y_n)}{[f^2(x_n)f'(y_n) - 2\beta x_n f(y_n)]},
\]
which we call Algorithm 2.1 for solving nonlinear equations.

\[ y_n = x_n - \frac{2f(x_n)f'(x_n)}{2f'^2(x_n) - f(x_n)f''(x_n)}, \quad n = 0, 1, 2, \ldots, \]

\[ x_{n+1} = y_n - \frac{f(y_n)}{f'(y_n) - \beta f(y_n)f'(x_n)}, \]

which we call Algorithm 2.2 for solving nonlinear equations.

\[ y_n = x_n - \frac{2f(x_n)f'(x_n)}{2f'^2(x_n) - f(x_n)f''(x_n)}, \quad n = 0, 1, 2, \ldots, \]

\[ x_{n+1} = y_n - \frac{f(y_n)}{f'(y_n) - \beta f(y_n)f'(x_n)}, \]

which we call Algorithm 2.3 for solving nonlinear equations.

Let \( p(z) \) be the complex polynomial. Then

\[ y_n = z_n - \frac{2f(z_n)f'(z_n)}{2f'^2(z_n) - f(z_n)f''(z_n)}, \quad n = 0, 1, 2, \ldots, \]

\[ z_{n+1} = y_n - \frac{f^2(z_n)f(y_n)}{f^2(z_n)f'(y_n) - 2\beta z_n f(y_n)}, \]

which is Algorithm 2.1 for solving nonlinear complex equations.

\[ y_n = z_n - \frac{2f(z_n)f'(z_n)}{2f'^2(z_n) - f(z_n)f''(z_n)}, \quad n = 0, 1, 2, \ldots, \]

\[ z_{n+1} = y_n - \frac{f(y_n)}{f'(y_n) - \beta f(y_n)f'(z_n)}, \]

which is Algorithm 2.2 for solving nonlinear complex equations.

\[ y_n = z_n - \frac{2f(z_n)f'(z_n)}{2f'^2(z_n) - f(z_n)f''(z_n)}, \quad n = 0, 1, 2, \ldots, \]

\[ z_{n+1} = y_n - \frac{f(y_n)}{f'(y_n) - \beta f(y_n)}, \]

which is Algorithm 2.3 for solving nonlinear complex equations.

Where \( z_0 \in \mathbb{C} \) is a starting point. The sequence \( \{z_n\}_{n=0}^\infty \) is called the orbit of the point \( z_0 \) converges to a root \( z^* \) of \( p \) then, we say that \( z_0 \) is attracted to \( z^* \). A set of all such starting points for which \( \{z_n\}_{n=0}^\infty \) converges to root \( z^* \) is called the basin of attraction of \( z^* \).
6. Convergence Test

In the numerical algorithms that are based on iterative processes we need a stop criterion for the process, that is, a test that tells us that the process has converged or it is very near to the solution. This type of test is called a convergence test. Usually, in the iterative process that use a feedback, like the root finding methods, the standard convergence test has the following form:

\[ |z_{n+1} - z_n| < \varepsilon, \] (6.1)

where \( z_{n+1} \) and \( z_n \) are two successive points in the iteration process and \( \varepsilon > 0 \) is a given accuracy. In this paper we also use the stop criterion (6.1).

7. Applications

In this section we present some examples of polynomiographs for different complex polynomials equation \( p(z) = 0 \) and some special polynomials using our developed algorithms. The different colors of a images depend upon number of iterations to reach a root with given accuracy \( \varepsilon = 0.001 \). One can obtain infinitely many nice looking polynomiographs by changing parameter \( k \), where \( k \) is the upper bound of the number of iterations.

7.1. Polynomiographs of Different Complex Polynomial

In this section, we present polynomiographs of the following complex polynomials, using our developed methods for \( \beta = 1 \). (Figures 1-13)

Example 7.1. Polynomiograph for \( z^2 - 1 = 0 \) via Newton’s method (row one, left figure), Ostrowski’s method (row one, middle (left) figure), Traub’s method (row one, middle (right) figure), modified Halley’s method (row one, right figure), Algorithm 2.1 (row two, left figure), Algorithm 2.2 (row two, middle figure) and Algorithm 2.3 (row two, right figure) are given below.

![Polynomiographs of Different Complex Polynomial](image-url)
Example 7.2. Polynomiograph for $z^2 + 1 = 0$ via Newton’s method (row one, left figure), Ostrowski’s method (row one, middle (left) figure), Traub’s method (row one, middle (right) figure), modified Halleys’s method (row one, right figure), Algorithm 2.1 (row two, left figure), Algorithm 2.2 (row two, middle figure) and Algorithm 2.3 (row two, right figure) are given below.

Example 7.3. Polynomiograph for $z^3 - 1 = 0$ via Newton’s method (row one, left figure), Ostrowski’s method (row one, middle (left) figure), Traub’s method (row one, middle (right) figure), modified Halleys’s method (row one, right figure), Algorithm 2.1 (row two, left figure), Algorithm 2.2 (row two, middle figure) and Algorithm 2.3 (row two, right figure) are given below.
Example 7.4. Polynomiograph for $z^3 + 1 = 0$ via Newton’s method (row one, left figure), Ostrowski’s method (row one, middle (left) figure), Traub’s method (row one, middle (right) figure), modified Halley’s method (row one, right figure), Algorithm 2.1 (row two, left figure), Algorithm 2.2 (row two, middle figure) and Algorithm 2.3 (row two, right figure) are given below.

Example 7.5. Polynomiograph for $z^4 - 1 = 0$ via Newton’s method (row one, left figure), Ostrowski’s method (row one, middle (left) figure), Traub’s method (row one, middle (right) figure), modified Halley’s method (row one, right figure), Algorithm 2.1 (row two, left figure), Algorithm 2.2 (row two, middle figure) and Algorithm 2.3 (row two, right figure) are given below.
Example 7.6. Polynomiograph for $z^4 + 1 = 0$ via Newton’s method (row one, left figure), Ostrowski’s method (row one, middle (left) figure), Traub’s method (row one, middle (right) figure), modified Halleys’s method (row one, right figure), Algorithm 2.1 (row two, left figure), Algorithm 2.2 (row two, middle figure) and Algorithm 2.3 (row two, right figure) are given below.

Example 7.7. Polynomiograph for $z^5 - 1 = 0$ via Newton’s method (row one, left figure), Ostrowski’s method (row one, middle (left) figure), Traub’s method (row one, middle (right) figure), modified Halleys’s method (row one, right figure), Algorithm 2.1 (row two, left figure), Algorithm 2.2 (row two, middle figure) and Algorithm 2.3 (row two, right figure) are given below.
Example 7.8. Polynomiograph for $z^5 + 1 = 0$ via Newton’s method (row one, left figure), Ostrowski’s method (row one, middle (left) figure), Traub’s method (row one, middle (right) figure), modified Halley’s method (row one, right figure), Algorithm 2.1 (row two, left figure), Algorithm 2.2 (row two, middle figure) and Algorithm 2.3 (row two, right figure) are given below.

Example 7.9. Polynomiograph for $z^6 - 1 = 0$ via Newton’s method (row one, left figure), Ostrowski’s method (row one, middle (left) figure), Traub’s method (row one, middle (right) figure), modified Halley’s method (row one, right figure), Algorithm 2.1 (row two, left figure), Algorithm 2.2 (row two, middle figure) and Algorithm 2.3 (row two, right figure) are given below.
Example 7.10. Polynomiograph for $z^7 - 1 = 0$ via Newton’s method (row one, left figure), Ostrowski’s method (row one, middle (left) figure), Traub’s method (row one, middle (right) figure), modified Halley’s method (row one, right figure), Algorithm 2.1 (row two, left figure), Algorithm 2.2 (row two, middle figure) and Algorithm 2.3 (row two, right figure) are given below.

Example 7.11. Polynomiograph for $z^8 - 1 = 0$ via Newton’s method (row one, left figure), Ostrowski’s method (row one, middle (left) figure), Traub’s method (row one, middle (right) figure), modified Halley’s method (row one, right figure), Algorithm 2.1 (row two, left figure), Algorithm 2.2 (row two, middle figure) and Algorithm 2.3 (row two, right figure) are given below.
Example 7.12. Polynomiograph for $z^9 - 1 = 0$ via Newton’s method (row one, left figure), Ostrowski’s method (row one, middle (left) figure), Traub’s method (row one, middle (right) figure), modified Halley’s method (row one, right figure), Algorithm 2.1 (row two, left figure), Algorithm 2.2 (row two, middle figure) and Algorithm 2.3 (row two, right figure) are given below.

Example 7.13. Polynomiograph for $z^{10} - 1 = 0$ via Newton’s method (row one, left figure), Ostrowski’s method (row one, middle (left) figure), Traub’s method (row one, middle (right) figure), modified Halley’s method (row one, right figure), Algorithm 2.1 (row two, left figure), Algorithm 2.2 (row two, middle figure) and Algorithm 2.3 (row two, right figure) are given below.
8. Conclusions

We have established three new sixth order methods for solving nonlinear functions. Our developed methods are all free from second and higher derivatives having efficiency index $6^{\frac{2}{3}} \approx 1.8171$. We compared our methods with other well known iterative methods and comparison Tables 1-7 show that our methods are quite fast and efficient from other similar methods. We also presented polynomiographs of different complex polynomials via our developed methods. The obtained polynomiographs are quite new, different from images by the Newton’s method, Halley’s method, Traub’s method and interesting from the aesthetic point of view.
