ABSTRACT

Background: Hanging is the most preferred method of Suicide. Individuals are known to use different Ligature material and suspend completely or partially. hence, it is important to understand the Parameters involved in it. Large number of Suicidal death are reported.

Objective: To Understand Suicidal Hanging by studying different parameters involved in it like Ligature Material, Type of Knot. Sex and Age Group, involved, kind of Suspension and Position of knot.

Materials & Methods: A total of 634 cases were studied . Crime scene examination was done only in those cases where their were Suspicion on the Suspension Deaths. Rest of the cases the crime scene photographs and investigating officer records were the inputs. Only Suicidal Hanging were Considered for the Study.

Result: Suicidal Hanging contributed to 6.5% of the Total Cases. The Ropes[27%] and Stole [36%]Contributed to the Most Preferred Ligature Material and Shoe Lace contribute[0.5%] to the least preferred Material for Self Suspension. Complete Suspension was observed in 62% of cases. The Majority of the Victims were Females contributing to 62% of the Deaths. The Major Age Group[50.76%] Involved was between 21-30years and the Uneffected Age group were those in the Extremes of Life i.e 1-10 and 61-70years. A Slip Knot was used on 97.73% of suspensions. In 78% of Suspension the Position of the Knot was situated over the [Typical Hanging]Nape of Neck. Married Victims Contributed to 37.45% of cases.

Conclusion: The different Parameters of Suicidal Hanging are necessary to understand the Suicidal Nature of Hanging.

1. Introduction

Hanging is a Form of Mechnical Asphyxia, wherein the Constriction of the Neck is from a Ligature Encircling the Neck, the Constricting Force being the Weight of the Body [Whole Body weight or Mere Weight of the Head]. It is well known Form of Asphyxial Death, Since 2500 Years, with its Origin in Persia. The Oxford English Dictionary states that hanging in this sense is "specifically to put to death by suspension by the neck", though it formerly also referred to crucifixion and death by impalement in which the body would remain "hanging". Hanging has been a common method of capital punishment since medieval times, and is the primary execution method in numerous countries and regions. The first known account of execution by hanging was in Homer’s Odyssey (Book XXII).¹ ² In this specialised meaning of the common word hang, the past and past participle is hanged³ instead of hung.

Hanging is a common method of suicide in which a person applies a ligature to the neck and brings about unconsciousness and then death by suspension or partial suspension. Hanging is a common suicide method. The materials necessary for suicide by hanging are readily
available to the average person, compared with firearms or poisons. In Canada, hanging is the most common method of suicide, and in the U.S., hanging is the second most common method, after self-inflicted gunshot wounds.

In the United Kingdom, where firearms are less easily available, in 2001 hanging was the most common method among men and the second most commonplace among women (after poisoning).

In hanging, ligature material may be any substance that is available at the time of the impulse and the Knot is frequently in the form of a single knot to produce a running noose or fixed by a granny or reef knot, occasionally a simple loop is used. About 800,000 people die by suicide worldwide every year, of these 135,000 (17%) are residents of India, a nation with 17.5% of world population. Between 1987 and 2007, the suicide rate increased from 7.9 to 10.3 per 100,000, with higher suicide rates in southern and eastern states of India. Hanging contributes to 26% of the primary methods used to die by suicide in 2012. Though the Numbers known to have increased since then. Hence, this Study helps us to Understand Suicidal Hanging better given the Long Period of Study and High Number of Cases Studied.

2. Materials and Methods
The study was conducted between 2009 and 2020 at various regions, Kingston & Bangalore. A total of 9684 Autopsies were conducted of which Suicidal Hanging contributed to 6.5% (n — 634) of cases. Crime scene examination was done only in those cases where their were Suspicion on the Suspension Deaths. Rest of the cases the crime scene photographs and investigating officer records were the inputs. Autopsies were conducted with enmasse removal of Thoracic and Abdominal Organs and the neck was the last to be dissected after Exploring all the body Cavities.

to correlate with the Possible Suspension Material. Internal findings of the neck studied layer by layer dissection of the neck. Carotid artery damage to the Intimae was by gross examination and Toluidine blue dye examination. Cervical vertebra fracture, thyroid, cricoid and hyoid bone fractures were confirmed by Radiological examination and further confirmed through the dissection method. The ligature material was always brought along with the dead body with the noose and knot intact (Figure 1).

3. Results

This Study was carried out between 2009 to 2020, a total of 9684 Autopsies were conducted of which 6.5% (n — 634) cases were Deaths due to Self Suspension. The Most preferred Ligature materials [Figure 1]were Stole 36%(n-228) and Bed Sheet-12%(n-76), Sari 19%(n-121), Ropes-27%(n-171), Belt-04%(n-25), Shoe Lace 0.5%(n-3),Clothes-1.5%(n-10). In 72% [n-456] of the cases, Hanging was Complete [Figure 2]. Females Contributed to 62% (n-393) of Cases and Males 48% (n-241) [Figure 3], were equally affected. The Major Age group [Figure 4] involved in both the Sexes were between 21-30 years, contributing to 51% (n-323) of the self suspension. The Age Group below 10years and Above 60years were Unaffected. A Slip type of Knot was used in majority of the Noose, contributing to 97.73% (n-619) of the suspensions [Figure 5]. In 78% of cases [n-494], the Position of the Knot situated [Figure 6] over the Nape of the Neck[Typical Hanging]. Married Victims contributed to 37.45% of cases.

4. Discussion

This prospective study was conducted between 2009 and 2020. A total of 9684 cases were autopsied during this period, of which deaths due to hanging comprised 6.5% (n — 634) of Autopsies. Similar studies conducted by Hassan et al.\textsuperscript{11} in a two-year period in Kuwait reported a total of 118 cases. In another study conducted by Kumar and Verma\textsuperscript{12} in Lucknow (India) a total of 4405 cases were autopsied in a five-year period of which Hanging contributed to 10% of cases. Dean et al.\textsuperscript{13} had studied on 229 cases. This Variations in the Number of Cases per Thousand Autopsies is possibly due to Regional Variations, Influence of Cultural and socioeconomic factors. Hence the present study is Important for its high Number of Cases Studied as compared to other Studies, this makes it more Unique in its Nature. The commonest and Most preferred choice of ligature material used were [Female dress (soft) material] Stole in 36%(n-228), followed by Rope in 27%(n-171) and the least Preferred Ligature Material were Shoe Lace [0.5%,n-3] and Garments/Cloth Wear contributing to 1.5%(n-10) cases. This were close to the Observations made by Jayprakash and Sreekumar\textsuperscript{14} Sharma et al.\textsuperscript{15}, they had opined 47% and 56% of their victims respectively preferred Soft ligature material like sari, Stole, shawl. In another Study conducted by Pradhan et al., Only 9.09%(n-4) used Sari/Stole Material.

In the present study hard ligature materials like Plastic Rope, Coir Rope and Cotton Rope contributed to 27% of cases, similar were the observations made by Jayprakash and Sreekumar.\textsuperscript{14} This wide nature of deviations in the choice of ligature material depends on the Cultural, Regional influence on the Dressing/Clothing of an Individual. It is observed that Sari in the southern part of India and Stole [Chunni] among females from northern India are widely used and are easily available in the house and hence the obvious choice in these regions. Whereas in the UK (Bennewith)\textsuperscript{16} the commonest choice was hard materials like Rope, Belt, Cord and Cable, soft materials like Sari or Stole were least found in that region. Hence factors like sex of the victim, culture, geographic
and Nagaraja \( (n – 494) \) of the victims had their knots over the Nape of the neck structures in deaths due to constriction of neck, with a special reference to hanging. The Registrar General of India, Government of India (2012). Available from: https://www.who.int/health-topics/suicide#tab-1.
