1.1 Supplementary Figures

Supplementary Figure 1. Concentration of IL-6 and IL-10 in supernatant of RAW-Blue\textsuperscript{TM} cells cultured on serum-adsorbed or lysate-adsorbed Teflon\textsuperscript{TM} AF for 72 (A, C) and 120 hours (B, D) with or without TLR2 inhibition. The concentrations of IL-6 (A, B) and IL-10 (C, D) were measured in duplicate using undiluted supernatant using a Luminex multiplexed immunoassay (n = 9). The concentrations for samples with absorbances above the limit of detection were interpolated or extrapolated from the standard curve.
