Abstract

Seven new species of the genus Lobrathium Mulsant & Rey from China are described and illustrated: L. anatinum Li & Li, sp. n. (Guangxi), L. diaoluoense Li & Li, sp. n. (Hainan), L. dufui Li & Li, sp. n. (Hubei), L. lirunyui Li & Li, sp. n. (Guizhou), L. pengi Li & Li, sp. n. (Guangxi), L. quyuani Li & Li, sp. n. (Hubei) and L. uncinatum Li & Li, sp. n. (Qinghai). A recent key to the species of mainland China is modified to accommodate the new species. New locality data are provided for eleven species.

Keywords

Coleoptera, Staphylinidae, Paederinae, Lobrathium, China, taxonomy, new species

Introduction

According to a recent revision (Assing 2012), the genus Lobrathium Mulsant & Rey, 1878 is represented in China by 43 species (24 species from mainland China and 20 from Taiwan, with Lobrathium hongkongense distributed both in mainland China and Taiwan). Later, Li et al. (2013) described four additional species from mainland China:
L. quadrum (Li, Solodovnikov & Zhou 2013), L. rutilum (Li, Solodovnikov & Zhou 2013), L. tortuosum (Li, Solodovnikov & Zhou 2013) and L. zonalis (Li, Solodovnikov & Zhou 2013). Herein, we report seven new species of Lobrathium from mainland China and additional locality data for eleven species.

Material and methods

All the material treated in this study is deposited in the Insect Collection of Shanghai Normal University, Shanghai, China (SNUC).

Type labels are cited in their original spelling. A slash (/) is used to separate different labels. Type material bears the following type label: ‘HOLOTYPE [red] or PARATYPE [yellow], [genus name, species name], sp. n., [authors of the species], det. 2013.

The specimens were killed with ethyl acetate and then dried. Materials were stored in 75% ethanol; genitalia and small parts were embedded in Euparal on plastic slides that were attached to the same pin with the specimens.

Morphological studies were carried out using an Olympus SZX 16 stereoscope. A digital camera Canon EOS 50D with MP-E 65 mm Macro Photo Lens was used for the habitus photos. An Olympus CX21 microscope and a digital camera Canon G9 were used for the photos of small structures. The map was created using MapGis.

The measurements of various body parts are abbreviated as follows: BL—length of the body from the labral anterior margin to the anal end; HL—length of the head from the anterior margin of the frons to the posterior margin of the head; HW—maximum width of the head; PL—length of the pronotum along the midline; PW—maximum width of the pronotum; EL—length of the elytra from the anterior margin to the elytral posterior margin along suture; EW—maximum width of the elytra; AL—length of the aedeagus from the apex of the ventral process to the base of the aedeagal capsule.

Taxonomy

Key to the Lobrathium species of mainland China (modified from Assing 2012: 84–86)

1 Elytra with posterior portion partly or completely yellowish or reddish, mostly with yellowish spots, and often with bluish to purple hue .......................2
2 Elytra with more or less extensive yellowish coloration posteriorly, at least posterior two fifths completely yellowish .................................................2a
2a ♂: sternite VI with modified, stout and short black setae (Fig. 18D). Qinghai .......................................................... L. uncinatum Li & Li sp. n.
New species and records of Lobrathium Mulsant & Rey...

– ♂: sternite VI without modified, stout and short black setae................................. 2b

2b ♂: sternite VII with modified, stout and short black setae (Fig. 8D). Hubei.
.....................................................................................................................L. dufui Li & Li sp. n.

– ♂: sternite VII without modified, stout and short black setae ......................... 3

3 ♂: posterior excision of sternite VIII smaller and less deep; aedeagus 1.1 mm long, with ventral process apically undivided. Shaanxi: Qinling Shan ...........
.................................................................................................L. schuelkei Assing, 2012

– ♂: posterior excision of sternite VIII slightly larger and somewhat deeper; aedeagus larger, 1.2–1.3 mm long, ventral process apically with two long processes. Hubei, Beijing, Shanxi...............................L. taureum Assing, 2012

4 Large species; length of forebody at least 4.9 mm. Pronotum broad, 1.10–1.20 times as long as broad. Elytra 0.90–0.95 times as long as pronotum and without bluish hue. ♂: sternite VII with distinctly modified, short and stout black setae; sternite VIII with conspicuously deep posterior excision, its depth at least approximately half the length of sternite; ventral process of aedeagus ventrally with rasp-like structures................................. 5

– Smaller species; length of fore body 4.6 mm at most. Pronotum more slender, 1.20–1.35 times as long as broad, only in one species broader (L. radens). Elytra often longer than pronotum and often with bluish or purple hue. ♂: sternite VII in most species without strongly modified setae; sternite VIII with less deep posterior excision, except in L. bispinosum and L. tuberosum........ 5a

5 Pronotum slightly broader, 1.10–1.15 times as long as broad. ♂: posterior excision of sternite VIII extremely deep, reaching well beyond middle of sternite; aedeagus 1.6 mm long, ventral process with two rasp-like projections and stoutly blade-shaped. Northern Yunnan: Diancang Shan ......................
.........................................................................................L. excisissimum Assing, 2012

– Pronotum slightly less broad, 1.15–1.20 times as long as broad. ♂: posterior excision of sternite VIII less deep, approximately reaching middle of sternite; aedeagus 1.5 mm long, ventral process with more numerous rasp like projections, somewhat more slender and apically more acute in ventral view. Eastern Guizhou: Leigong Shan ........................................L. radens Assing, 2012

5a ♂: aedeagus 1.70–1.72 mm long, ventral process apically not bifid (Fig. 2C). Guangxi.................................................................L. anatinum Li & Li sp. n.

– ♂: aedeagus 1.35 mm long, ventral process apically bifid............................... 6

6 Elytral spots situated in anterior portion of posterior half of elytra (i.e., at some distance from posterior margin). Dorsal surface of head uneven, with median and lateral impressions. Punctuation of head and pronotum extremely dense. Relatively large species; length of fore body 4.4–4.6 mm. Antennae slender. ♂: sternite VII moderately transverse; aedeagus 1.35 mm long, ventral process apically bifid. Western Hubei: Daba Shan, Guizhou, Shaanxi ....
............................................................................L. ablectum Assing, 2012

– Elytral spots situated at or near posterior margin of elytra. Dorsal surface of head without distinct impressions. Punctuation of head and pronotum less
dense. Smaller species, length of fore body usually 4.0 mm at most, except for *L. spathulatum* (3.7–4.5 mm). Male sexual characters different. A reliable identification of the following species is possible only based on the male sexual characters.

6a ♂: bifurcation of the apex of the ventral process of the aedeagus forming an angle of more than 30 degrees in lateral view (Fig. 12B). Guangxi, Shiwanda Shan .......................... *L. pengi* Li & Li sp. n.

– ♂: bifurcation of the apex of the ventral process of the aedeagus forming an angle of less than 30 degrees in lateral view (Fig. 7B). Hainan ...........................

.......................................................... *L. diaoluoense* Li & Li sp. n.

7 Elytra black, without bluish or purple hue, 0.9–1.0 times as long as pronotum .........................................................................................

– Elytra usually with, rarely without bluish or purple hue, 1.0–1.15 times as long as pronotum ...........................................................

8 ♂: sternite VIII with small posterior excision in asymmetric position, posterior margin with tooth-like projection on either side of excision; aedeagus approximately 1.5 mm long, ventral process very long, slender, and apically asymmetric. Widespread: Sichuan, Shaanxi, Hubei, Guizhou ........................ *L. tortile* Zheng, 1988

– ♂: sternite VIII with deep posterior excision in symmetric position; aedeagus of different morphology ........................................................................

9 ♂: aedeagus 0.9–1.0 mm long, ventral process long, slender, apically acute, and very thin at base; sternite VIII with very broad and deep posterior excision, on either side of excision with dense pubescence. Central Sichuan: Qingcheng Shan .............................. *L. gladiatum* Zheng, 1988

– Male sexual characters different ................................................................

10 ♂: sternite VII anteriorly with tubercle; sternite VIII oblong and with U-shaped posterior excision; aedeagus 1.2 mm long and with massive ventral process. Jiangxi .......................... *L. tuberosum* Assing, 2012

– ♂: sternite VII without tubercle; posterior excision of sternite VIII of different shape; aedeagus longer, at least approximately 1.4 mm long ...........

11 ♂: sternite VII with shallow posterior impression with pubescence; sternite VIII with moderately deep posterior excision and of characteristic chaetotaxy; aedeagus 1.4 mm long and with ventral process of distinctive shape. Northeastern Hubei, Zhejiang .................................................. *L. demptum* Assing, 2012

– ♂: sternite VII with more pronounced posterior impression without pubescence; posterior excision of sternite VIII much deeper, broader, and of subtrapezoid shape; aedeagus longer, 1.5 mm long, ventral process with two tooth-like projections ventrally. Southeastern Guizhou, Jiangxi ......................

.......................................................... *L. bispinosum* Assing, 2012

12 Elytra with weak purple hue; posterior spots relatively small, defined, and of circular shape. Pronotum less oblong, approximately 1.2 times as long as broad. ♂: sternite VII moderately transverse and with moderately deep pos-
terior excision; aedeagus 1.0 mm long, ventral process with dorsal carina and apically acute. Northern Yunnan .............L. retrocarinatum Assing, 2012

Elytra usually with bluish hue; posterior spots usually larger and/or of different shape or less defined. Pronotum more oblong, at least approximately 1.25 times as long as broad. ♂: sternite VII either with strongly modified short and black setae or without modified setae at all; sternite VIII and aedeagus of different shape ........ 13

♀: sternite VII with distinctly modified short and stout black setae; sternite VIII with deep U-shaped posterior excision; aedeagus approximately 1.2 mm long, ventral process of distinctive morphology. Sichuan, Shaanxi, Yunnan...

.................................................................L. hebeatum Zheng, 1988

♂: sternite VII without distinctly modified setae; sternite VIII with less deep and differently shaped posterior excision; aedeagus of different morphology .......... 14

♀: posterior excision of sternite VII larger and of broadly triangular shape; aedeagus of different shape. Species with more restricted distributions .... 14a

♂: aedeagus ventral process broader, evenly narrowed and acute apically in ventral view (Fig. 13C). Hubei .........................L. quyuani Li & Li sp. n.

♀: aedeagus ventral process of different shape in ventral view ................. 15

♂: aedeagus of somewhat variable shape and size, 1.3–1.5 mm long, ventral process very slender, apically acute, and weakly asymmetric; sternites VII and VIII as in Figs 4D, E. Widespread in China: Shaanxi, Sichuan, Hubei, Yunnan, Qinghai .........................................................L. configens Assing, 2012

♂: aedeagus longer, 1.6–1.8 mm long, ventral process distinctly asymmetric and apically distinctly dilated (ventral view); sternites VII and VIII as in Figs 14D, E. Widespread in China: Sichuan, Shaanxi, Shanxi, Hubei, Zhejiang..

.................................................................L. spathulatum Assing, 2012

15a Body reddish to reddish-brown; head posterior angles not marked, punctuation fine and dense; eyes very small, one third as long as distance from posterior margin of eyes to neck; elytra 1.25 times as wide as pronotum. ♂: aedeagus 1.56 mm long, ventral process of distinctive morphology (Figs 11A–E). Guizhou .................................................................L. lirunyui Li & Li sp. n.

– Male characters different .................................................................................. 16

Figs 2

**Type material** (2 ♂♂). **Holotype**, ♂: “China, Guangxi, Lingui County, Anjiangping, 1700 m, 25°33′N, 109°55′E, 17–VII–2011, Peng Zhong leg. / Holotype ♂, Lobrathium anatinum, sp. n. Li & Li, det. 2013”. **Paratype**, ♂: “China, Guangxi, Lingui County, Anjiangping, 1400–1700 m, 25°33′N, 109°56′E, 14–VII–2011, Peng Zhong leg. / Paratype ♂, Lobrathium anatinum, sp. n. Li & Li, det. 2013”.

**Description.** Body length 7.28–7.89 mm, length of fore body 3.89–4.0 mm. Habitus as in Fig. 2A. Coloration: body black with distinct bluish hue, middle of elytra with yellowish spot not reaching lateral and posterior margins; legs blackish with paler tarsi, antennae dark brownish to blackish.

Head weakly transverse (HW/HL = 1.10–1.11), widest across eyes; posterior angles broadly rounded; punctation dense and moderately coarse, sparser in median dorsal portion; interstices without microsculpture. Eyes large, more than half as long as distance from posterior margin of eye to neck in dorsal view. Antenna long and slender, 1.96–2.22 mm long.

Pronotum 1.24–1.30 times as long as broad, as wide as head (PW/HW = 1.0), lateral margins convex in dorsal view, punctuation similar to that of head, but with impunctate midline, interstices glossy.

Elytra wider than pronotum and nearly as long as pronotum (EL/EW = 0.95–1.0, EW/PW = 1.15–1.3, EL/PL = 0.91–0.94); punctuation coarse and dense, arranged in series; interstices without microsculpture. Hind wings apparently present.

Abdomen broader than elytra; punctuation fine and dense; posterior margin of tergite VII with palisade fringe.

**Male.** Sternite VII (Fig. 2D) strongly transverse and with distinct median impression, this impression without pubescence, posterior margin broadly concave; sternite VIII (Fig. 2E) weakly transverse, with long and pronounced postero-median impression, this impression with numerous modified, stout and short black setae, posterior excision moderately broad and moderately deep, on either side of this excision with long dark setae; aedeagus (Figs 2B, C) 1.70–1.72 mm long, ventral process long, flattened, and apically convex in ventral view.

**Female.** Unknown

**Etymology.** The specific epithet (Latin, adjective: of a duck) refers to the shape of the ventral process of the aedeagus, which somewhat resembles the mouth of a duckbill.

**Comparative notes.** This species is close to *L. ablectum* Assing (2012) in sharing a similar shape and chaetotaxy of the sternites VII and VIII. The new species differs from *L. ablectum* by larger body size, and by the longer, apically not bifid ventral process of the aedeagus.

**Habitat and distribution.** The present species was sifted from wet moss near a cold stream (Fig. 20A) in the Angjiangping National Reserve, Guangxi (Fig. 19), in July.

Lobrathium diaoluoense Li & Li, sp. n.
urn:lsid:zoobank.org:act:712D3A23-CF9D-454E-864A-48C10F88F56B
http://species-id.net/wiki/Lobrathium_diaoluoense
Figs 7

Type material (10 ♂♂, 16 ♀♀). Holotype, ♂: “China, Hainan, Lingshui County, Diaoluo Shan, 1000 m, 18°43’N, 109°51’E, 24–IV–2012, Peng Zhong & Dai Congchao leg. / Holotype ♂, Lobrathium diaoluoense, sp. n., Li & Li, det. 2013”. Paratypes, 9 ♂♂, 16 ♀♀: same data as holotype.

Description. Body length 4.61–5.95 mm, length of fore body 2.94–3.28 mm. Habitus as in Fig. 7A. Coloration: body black, posterior portion of elytra with yellowerish spot reaching posterior and lateral margins; legs with paler tarsi; antennae yellowish.

Head as long as broad or weakly oblong (HL/HW = 1.0–1.09); posterior angles marked; punctation coarse and dense, sparser in median dorsal portion, interstices without microsculpture. Eyes large, more than half as long as distance from posterior margin of eye to neck. Antenna slender, 1.54–1.78 mm long.

Pronotum slender, approximately as wide as head (PL/PW = 1.25–1.31, PW/HW = 0.96–1.0), lateral margins weakly convex in dorsal view; punctation dense and coarse, similar to that of head, median dorsal portion more sparsely punctate or impunctate; interstices without microsculpture and glossy.

Elytra longer and broader than pronotum (EL/EW = 1.09–1.15, EW/PW = 1.24–1.37, EL/PL = 1.11–1.14); humeral angles marked; punctation coarse and dense, interstices without microsculpture and glossy. Hind wings fully developed.

Abdomen distinctly narrower than elytra; punctation fine and dense; posterior margin of tergite VII with palisade fringe; posterior margin of tergite VIII weakly concave, without appreciable sexual dimorphism.

Male. Sternite VII (Fig. 7D) with deep and broad median impression without pubescence, posterior margin broadly and rather strongly concave; sternite VIII oblong, with deep and large U-shaped posterior excision (Fig. 7F), without modified setae, on either side of posterior excision with long dark setae; aedeagus (Figs 7B, C) with ventral process of very distinctive morphology, furcate apically, and this bifurcation forming an angle of less than 30 degrees in lateral view.

Female. Posterior margin of tergite VIII (Fig. 7G) weakly convex; sternite VIII (Fig. 7H) of similar shape as tergite VIII; tergite IX (Fig. 7I) undivided anteriorly; tergite X of subovoid shape.

Etymology. The specific epithet (adjective) is derived from the Diaoluo Shan where the type locality is situated.

Comparative notes. This species is similar to L. bipeniculatum Assing (2010) and L. pengi Li & Li sp. n. (described below) in sharing similar shapes of the male sternites VII and VIII, and of the aedeagus. It can be separated from L. bipeniculatum by the broader median impression of the male sternite VII (Fig. 7D), and by the absence of clusters of long dark setae at the margins of the posterior excision of the male sternite VIII (Fig. 7F). In L. pengi, the ventral process of the aedeagus is of different shape, with the apical bifurcation forming an angle of more than 30 degrees in lateral view.
Habitat and distribution. The present species was sifted from wet moss on stones alongside a reservoir (red circle in Fig. 20B) in the Diaoluo Shan, Hainan (Fig. 19), in April.

http://species-id.net/wiki/Lobrathium_dufui
Figs 8

Type material (1 ♂, 2 ♀♀). Holotype, ♂: “China, Hubei, Wufeng County, Houhe National Reserve, 30–IV–2004, 1100 m, 30°04’N, 110°37’E, Li Li-zhen leg. / Holotype ♂, Lobrathium dufui, sp. n. Li & Li, det. 2013”. Paratypes, 2 ♀♀: same data as holotype.

Description. Body length 5.84–6.89 mm, length of fore body 3.34–3.61 mm. Habitus as in Fig. 8A. Coloration: body black, posterior portion of elytra with oblong yellowish spot of at least 2/5 the length of elytra and reaching posterior margins and lateral margins; legs blackish with slightly paler tibiae and tarsi; antennae brown.

Head weakly transverse (HW/HL = 1.02–1.09), widest at eyes, weakly tapering behind eyes; posterior angles rounded, not marked; punctation coarse and moderately dense, sparser in median dorsal portion and on frons; interstices without microsculpture. Eyes large, more than half the length of postocular region from posterior margin of eyes to neck in dorsal view. Antenna slender, 1.72–2.18 mm long.

Pronotum approximately as wide as head (PL/PW = 1.25–1.31, PW/HW = 0.96–1.10); lateral margins weakly convex in dorsal view; punctation dense and coarse, similar to that of head, but with impunctate midline; interstices without microsculpture and glossy.

Elytra broader than pronotum (EL/EW = 1.02–1.06, EW/PW = 1.21–1.39, EL/PL = 1.01–1.08); humeral angles marked; punctation coarse and dense. Hind wings apparently present.

Abdomen distinctly narrower than elytra; punctation fine and dense; posterior margin of tergite VII with palisade fringe; tergite VIII (Fig. 8F) without appreciable sexual dimorphism, posterior margin broadly convex.

Male. Sternite VII (Fig. 8D) transverse and posteriorly with pronounced impression of triangular shape, this impression impunctate in the middle and laterally with a few modified, stout and short black setae, posterior margin broadly and weakly concave; sternite VIII (Fig. 8E) weakly transverse, with deep and broad, U-shaped posterior excision, median impression furnished with numerous modified, stout, short and black setae; aedeagus (Figs 8B, C) with ventral process of very distinctive morphology, apically with fissure and bifid.

Female. Sternite VIII (Fig. 8G) weakly transverse, posteriorly convex; tergite IX (Fig. 8H) undivided anteriorly, anterior margin emarginated in the middle; tergite X of subovoid shape.

Etymology. The species is named after the famous late poet Fu Du, who was born in Hubei.

Comparative notes. This species is similar to L. uncinatum Li & Li sp. n. (described below) in external characters, and to L. hebeatum Zheng (1988) in sexual characters. It differs from L. uncinatum by the shape of the aedeagus and by the absence of
Figure 8. Lobrathium dufui. **A** habitus **B** aedeagus in lateral view **C** aedeagus in ventral view **D** male sternite VII **E** male sternite VIII **F** female tergite VIII **G** female sternite VIII **H** female tergites IX-X. Scales: **A** 1mm, **B–H** 0.5mm.
modified setae on the male sternite VI, and from *L. hebeatum* by the shape of the apex of the ventral process of the aedeagus.

**Habitat and distribution.** The type specimens were sifted from wet moss near a stream (Fig. 20C) in Hubei (Fig. 19).

Figs 11

Type material (1 ♂). Holotype, ♂: “China, Guizhou, Zunyi City, Fenghuang Shan, 800 m, 27°41’N, 106°55’E, 19–VI–2012, Li Run-yu leg. / Holotype ♂, *Lobrathium lirunyui*, sp. n. Li & Li, det. 2013”.
**Description.** Large species, body length 9.40 mm, length of fore body 4.20 mm. Habitus as in Fig. 11A. Body reddish brown, legs reddish with pale-reddish tarsi, antennae reddish to brown.

Head longer than wide (HL/HW = 1.06), widest posteriorly; posterior angles weakly marked; punctuation of dorsal surface fine and very dense; interstices without microsculpture. Eyes small, approximately one third the length of distance from posterior margin of eye to neck in dorsal view. Antenna long and slender, 2.50 mm long.
Pronotum slender (PL/PW = 1.28, PW/HW = 0.90), lateral margins almost straight and subparallel in dorsal view; punctation similar to that of head, but with impunctate midline.

Elytra longer than wide (EL/EW = 1.02, EW/PW = 1.25, EL/PL = 1.08); punctation coarse and dense, arranged in somewhat irregular series; interstices without microsculpture. Hind wings apparently fully developed.

Abdomen distinctly narrower than elytra; punctation fine and dense; posterior margin of tergite VII with palisade fringe.

**Male.** Sternite VII (Fig. 11D) strongly transverse, and with shallow median impression posteriorly, without modified setae, posterior margin broadly and weakly concave; sternite VIII (Fig. 11E) weakly transverse, with long and extensive posteromedian impression, this impression with numerous modified, stout and short black setae, posterior excision rather broad and U-shaped, on either side of this excision with long dark submarginal setae; aedeagus (Figs 11B, C) 1.56 mm long, with asymmetric ventral process of distinctive shape.
Female. Unknown

Etymology. The species is named after Runyu Li, collector of the holotype.

Comparative notes. This species is readily distinguished from all its congeners by the following character combination: elytra without spot, whole body of brownish coloration; punctation of head fine and dense, eyes very small, one third as long as distance from posterior margin of eye to neck, male sexual characters highly distinctive.

Habitat and distribution. The holotype was sifted in fern vegetation near a wet tree root (Fig. 20D) in the Fenghuang Shan, Guizhou (Fig. 19).

Lobrathium pengi Li & Li, sp. n.
urn:lsid:zoobank.org:act:50DF2D82-E0AD-4B81-996D-BEFC980CD79A
http://species-id.net/wiki/Lobrathium_pengi
Figs 12

Type material (7 ♂♂, 3 ♀♀). Holotype, ♂: “China, Guangxi, Shangsi County, Shi-wanda Shan, Forest Park, 300–500 m, 21°54’N, 107°54’E, 25–IV–2011, Peng Zhong & Zhu Jian-qing leg. / Holotype ♂, Lobrathium pengi, sp. n. Li & Li, det. 2013”.
Paratypes, 6 ♂♂, 3 ♀♀: same data as holotype.

Description. Body length 6.34–7.34 mm, length of fore body 3.11–3.73 mm. Habitus as in Fig. 12A. Coloration: body black, elytra in posterior 1/3–2/5 with sub-circular yellowish spot reaching posterior, but not lateral margins; legs yellowish with forelegs brown to blackish, femora and protibiae and tarsi paler; antennae brown.

Head weakly transverse (HW/HL = 1.02–1.03); posterior angles not marked; punctation coarse and dense, sparser in median dorsal portion, interstices without microsculpture. Eyes large, more than half as long as the distance from posterior margin of eye to neck. Antenna slender, 1.68–1.82 mm long.

Pronotum nearly as wide as head (PL/PW = 1.13–1.33, PW/HW = 0.97–0.98), lateral margins weakly convex in dorsal view; punctuation dense and coarse, similar to that of head, but with impunctate midline; interstices without microsculpture and glossy.

Elytra broader than pronotum (EL/EW = 1.0–1.06, EW/PW = 1.35–1.40, EL/PL = 0.98–1.12); humeral angles marked; punctuation coarse and dense. Hind wings fully developed.

Abdomen distinctly narrower than elytra; punctation fine and dense; posterior margin of tergite VII with palisade fringe; tergite VIII (Fig. 12F) without appreciable sexual dimorphism, with weakly convex posterior margin.

Male. Sternite VII (Fig. 12D) strongly transverse, posterior impression of triangular shape and impunctate, posterior margin broadly and concave; sternite VIII (Fig. 12E) weakly transverse, without modified setae, posterior excision deep and rather narrow, on either side of this excision with long dark setae; aedeagus (Fig. 12B, C) approximately 1.0 mm long, ventral process of very distinctive morphology, slender and furcate apically, bifurcation forming an angle of more than 30 degrees in lateral view.
Female. Sternite VIII as in Fig. 12G; tergites IX-X (Fig. 6H) relatively short; tergite IX undivided anteriorly, anterior margin emarginated in the middle; tergite X of subovoid shape.

Etymology. The species is named after Zhong Peng, collector of the type specimens.

Comparative notes. This species is similar to *L. diaoluoense*, from which it is separated by the broader and apically more abruptly narrowed ventral process of the
New species and records of Lobrathium Mulsant & Rey...

...aedeagus, with the apical bifurcation forming an angle of more than 30 degrees in lateral view.

**Habitat and distribution.** The specimens were sifted from wet moss along a streamside (Fig. 20E) in the Shiwanda Shan, Guangxi (Fig. 19), in April.

**Lobrathium quyuani Li & Li, sp. n.**

http://species-id.net/wiki/Lobrathium_quyuani
Figs 13

**Material (3 ♂♂).** **Holotype, ♂:** “China, Hubei, Wufeng County, Houhe National Reserve, 1100 m, 30°04′N, 110°37′E, 30–IV–2004, Li Li-zhen leg. / Holotype ♂, Lobrathium quyuani, sp. n. Li & Li, det. 2013”. **Paratypes, 2 ♂♂:** same data as holotype.

**Description.** Body length 5.78–6.34 mm, length of fore body 3.28–3.56 mm. Habitus as in Fig. 13A. Coloration: body black with bluish hue, elytra with yellowish to reddish spot reaching posterior but not lateral margins; legs blackish with dark-brownish tarsi; antennae dark-brownish.

Head as wide as long (HW/HL = 0.96–1.03), widest at eyes; posterior angles broadly rounded; punctation dense and moderately coarse, sparser in median dorsal portion; interstices without microsculpture. Eyes large, more than half as long as the distance from posterior margin of eye to neck in dorsal view. Antenna slender, 1.72–1.95 mm long.

Pronotum slender (PL/PW = 1.25–1.41, PW/HW = 0.92–1.0), lateral margins weakly convex in dorsal view, with impunctate midline, punctation similar to that of head, but distinctly sparser, interstices glossy.

Elytra longer than broad (EL/EW = 1.0–1.02, EW/PW = 1.24–1.33, EL/PL = 1.0–1.05); punctation coarse and dense, arranged in irregular series; interstices without microsculpture. Hind wings fully developed.

Abdomen narrower than elytra; punctation fine and dense; posterior margin of tergite VII with palisade fringe; posterior margin of tergite VIII strongly convex in the middle.

**Male.** Sternite VII (Fig. 13D) strongly transverse, posteriorly with pronounced median impression, this impression of somewhat triangular shape, without punctation and pubescence, posterior margin broadly and very weakly concave; sternite VIII (Fig. 3E) weakly transverse, postero-median impression with modified, stout and short black setae, posterior excision deep and moderately broad, on either side of this excision with long dark submarginal setae; aedeagus (Figs 13B, C) 1.36 mm long, with weakly asymmetric and apically acute ventral process.

**Female.** Unknown

**Etymology.** The specific epithet refers to the famous late poet Yuan Qu, who was born in Yichang (Hubei), which is near the type locality.
Figure 13. Lobrathium guyuani. A habitus B aedeagus in lateral view C aedeagus in ventral view D male sternite VII E male sternite VIII. Scales: A 1mm, B–E 0.5mm.

Comparative notes. This species is similar to *L. configens* Assing (2012) and *L. spathulatum* Assing (2012) in external characters. It is distinguished from both by the broader ventral process in ventral view.

Habitat and distribution. The specimens were sifted from wet moss near a stream (Fig. 20C) in the Houhe National Reserve, Hubei (Fig. 19).

http://species-id.net/wiki/Lobrathium_tortuosum
Figs 17

Lobrathium tortuosum Li, Solodovnikov & Zhou, 2013: 574. Type locality: Fengyang Shan, Zhejiang.

Material examined (3 ♂♂, 1 ♀). China, Zhejiang: 1 ♂, Qingliangfeng, 1080 m, 08–V–2005, Zhu & Li leg.; 1 ♂, 1 ♀, Longquan City, Fengyang Shan, 1450–1600 m, 22–VII– 2006, Shen & Li leg.; 1 ♂, Baishanzu N.R., 1200–1360 m, 05–V–2004, Hu et al. leg.

Distribution. The original description of L. tortuosum is based on specimens from the Fengyang Shan, Zhejiang (Li et al., 2013). The above records from Qingliangfeng extend the distributional range about 200 km northwards. The known distribution is confined to the Tianmu Shan and the Donggong Shan in Zhejiang.

nounced impression, this impression with numerous modified stout black setae, posterior margin broadly and weakly concave; sternite VIII (Fig. 18F) transverse, posterolateral impression with modified setae like on sternites VI and VII, posteriorly with moderately deep excision; aedeagus (Figs 18B, C) with ventral process of distinctive morphology, near middle with distinct dorsal projection in lateral view.

**Female.** Unknown

**Etymology.** The specific epithet (Latin, hooked) refers to the shape of the ventral process of the aedeagus.

**Comparative notes.** This species can be separated from the externally similar *L. taureum* Assing (2012) and *L. schuelkei* Assing (2012) by the presence of modified se-
tae on the male sternites VI and VII (Figs 18D, E) and by the distinctive shape of the ventral process of the aedeagus.

**Habitat and distribution.** The holotype was sifted from wet moss alongside a river bank (Fig. 20F) in the Meda National Reserve, Qinghai (Fig. 19).
