A corrigendum on

Long-term NMDAR antagonism correlates reduced astrocytic glutamate uptake with anxiety-like phenotype

by Zimmer, E. R., Torrez, V. R., Kalinine, E., Augustin, M. C., Zenki, K. C., Almeida, R. F., et al. (2015). Front. Cell. Neurosci. 9:219. doi: 10.3389/fncel.2015.00219

In the subsection “Glutamate Uptake Assay,” the greek letter micro (symbol µ) was accidentally deleted twice probably due to software incompatibility. The correct sentence should read: “Afterwards, 0.66 and 0.33 µCi ml⁻¹ L-[3H]glutamate were added to a final 100 µM concentration of glutamate for incubation with hippocampal and cortical samples, respectively.” This correction does not affect the scientific relevance of the results.

AUTHOR CONTRIBUTIONS

EZ was responsible for the design, acquisition, analysis, interpretation, drafting, and approval of the final version of the manuscript. VT, EK, MA, KZ, RA, and GH were responsible for acquisition, analysis, interpretation, and approval of the final version of the manuscript. AM, DS, and RM were responsible for interpretation, drafting, critical revision, and approval of the final version of the manuscript. LP was responsible for the design, interpretation, drafting, critical revision, and approval of the final version of the manuscript.

FUNDING

This work was supported by the following Brazilian agencies and grants: National Counsel of Technological and Scientific Development (CNPq), CAPES, FAPERGS, Brazilian Institute of...
Neuroscience (IBNnet), FINEP, and National Institute of Science and Technology (INCT) – Excitotoxicity and Neuroprotection.
