See reference page for full text.
expertise, and available experience to carry out this test, which greatly supports our clinical practice.

Our friends and mentors Drs. Andy Bush and Clair Hogg best described our position long ago: "It is simply not good enough to dismiss videomicroscopy as 'difficult and limited in availability'; if it is the best test, it should be made available. No one would advocate abandoning the sweat test because unskilled use leads to false positives and negatives, nor should functional ciliary studies be displaced because they are not easy and the equipment is sophisticated." (12).

**Figure 1.** Suggested diagnostic algorithm for evaluating patients with suspected primary ciliary dyskinesia. Additional corroborative testing may provide information on clinical prognosis, further understanding of the disease, and suggest potential future therapeutic considerations. Reprinted from Reference 10. For a complete list of footnote symbols, see Figure 1 in Reference 10. CF = cystic fibrosis; nNO = nasal nitric oxide; PCD = primary ciliary dyskinesia; TEM = transmission electron microscopy.
