ABSTRACT

Bio friendly green modest synthesis of nanoparticles are the present research in the extremity of nanotechnology. This study has been undertaken to explore the determinants of silver nanoparticles from 1 mM AgNO₃ solution through profuse concentration of aqueous flower extract of Mirabilis jalapa reducing besides immobilizing agent. The attribute of silver nanoparticles was studied by using UV-VIS spectroscopy SEM and XRD. The XRD spectrum of the silver nanoparticles established the presence of elemental silver signal. Green synthesized silver nanoparticle manifests the zone of inhibition against isolated human pathogenic (Streptococcus species, Bacillus species, Staphylococcus species, Klebsiella species and E. coli) bacteria. The analytical chassis contains the flower pigment betalain the natural food dye resources can efficiently use in the production of silver nanoparticle and it could be utilized in various fields in therapeutic and nanotechnology.

Index Terms - Nanoparticles, Mirabilis jalapa, Antibacterial activity, UV-VIS spectroscopy, SEM, XRD.

1. INTRODUCTION

Mirabilis jalapa (four O’Clock plant) belongs to the family Nyctaginaceae. Mirabilis jalapa bloom all the summer long. They have antifungal, antimicrobial, antiviral, antispasmodic and antibacterial properties (Dimayuga, 1998; Yang, 2001). Mirabilis jalapa flower contains betalain pigments are classified in to red(crimson) betacyanin’s and yellow betaxanthins (Strack et al., 2003). Antibacterial properties of silver are documented since 1000 B.C., when silver vessels were used to preserve water (Richard et al., 2002; Castellano et al., 2007). Environmental-friendly antimicrobial nano paint can be developed (Kumar et al., 2008). Silver has been-known to possess strong antimicrobial properties both in its metallic and nanoparticle forms hence; it has found variety of application in different fields. The Fe₃O₄ attached Ag nanoparticles can be used for the treatment of water and easily removed using magnetic field to avoid contamination of the environment (Gong et al., 2007). The silver nanoparticles are reported to show better wound healing capacity, better cosmetic appearance and scar less healing when tested using an animal model (Tian et al., 2006). Although few silver-containing compounds are approved by the FDA for direct food contact, silver-incorporated food packaging is quite widespread in Japan (Appendini and Hotchkiss, 2002). Silica gel micro-spheres mixed with silica thio-sulfate are used for long lasting antibacterial activity (Gupta and Silver, 1998) and treatment of burns and various infections (Feng et al., 2000). Silver has been known to possess strong antimicrobial properties both in its metallic and nanoparticle forms hence; it has found variety of application in different fields. The Fe₃O₄ attached Ag nanoparticles can be used for the treatment of water and easily removed using magnetic field to avoid contamination of the environment (Gong et al., 2007). Silver nanoparticles can be used for water filtration (Jain and Pradeep, 2005). Use of plant sources offers several advantages such as cost-effectiveness, eco-friendliness and the elimination of high pressure, energy, temperature, and toxic chemicals necessary in the traditional synthesis methods (Sun and Xia, 2002).

The most important application of silver and silver nanoparticles is in medical industry such as topical ointments to prevent infection against burns and open wound. Silver ions (Ag⁺) and its compounds are highly toxic to microorganisms exhibiting strong biocidal effects on many species of bacteria but have a low toxicity towards animal cells (Prema, 2011). It has also been proposed that the antibacterial mechanism of silver nanoparticles is related to the formation of free radicals and subsequent free radical-induced membrane damage (Danilczuk et al., 2006; Kim et al., 2007). The silver nanoparticle containing poly vinyl nano-fibers also show efficient antibacterial property as wound dressing (Jun et al., 2007). Silver zeolite is used in food preservation, disinfection and decontamination of products (Matsura et al., 1997; Nikawa et al., 1997). It was also observed that when treated with Ag⁺, E. coli, a gram-negative bacterium, sustained more structural damages than the gram-negative Staphylococcus aureus (Feng et al., 2000). Silver impregnated medical devices like surgical masks and implantable devices show significant antimicrobial efficacy (Furno et al., 2004). Feng et al., (2000) conducted a study to observe the effects of silver ions on gram-positive (Staphylococcus aureus) and gram-negative bacteria (Escherichia coli). Use of plant sources offers several advantages such as cost-
Cell membrane detachment from the cell wall, cell wall damage, and electron dense granules outside and, in some instances, inside the cell. It was proposed that condensation of DNA occurred as a protective measure in order to protect the genetic information of the cell (Feng et al., 2000). Silver zeolite is used in food preservation, disinfection and decontamination of products (Matsuura et al., 1997; Nikawa et al., 1997). Silver sulfadiazine depicts better healing of burn wounds due to its slow and steady reaction with serum and other body fluids (Fox and Modak, 1974). Toxicity from silver is observed in the form of argyria, only when there is a large open wound and large amount of silver ions are used for dressing. There are no regular reports of silver allergy (Leaper, 2006). Studies shows that silver nanoparticles anchor to and penetrate the cell wall of Gram-negative bacteria (Morones et al., 2005). cell membrane detachment from the cell wall, cell wall damage, and electron dense granules outside and, in some instances, inside the cell. It was proposed that condensation of DNA occurred as a protective measure in order to protect the genetic information of the cell (Feng et al., 2000). Silver sulfadiazine depicts better healing of burn wounds due to its slow and steady reaction with serum and other body fluids (Fox and Modak, 1974). The main objectives of this study were to (1) Synthesize the silver nanoparticles using aqueous flower extract of Mirabilis jalapa, (2) characterization of silver nanoparticles by using UV-Vis spectroscopy, SEM-XRD (3) analyze antimicrobial properties against human pathogenic bacteria.

II. MATERIALS AND METHODS

i. **SAMPLE COLLECTION**

*Mirabilis jalapa* flower extract were collected from Thodupuzha, Idukki district of Kerala state, India.

The fresh flowers were collected and washed with distilled water. The plant materials were thoroughly washed with distilled water and fresh weight were determined. The samples are then oven dried at 50°C for 24 h. The dried samples were powdered using a warnig blender and stored in air-tight bottles until further analysis.

ii. **Extraction Method**

*Mirabilis jalapa* flower extract was prepared with 10 g of fresh flower taken in a beaker. It was thoroughly washed with tap water and then with distilled water for at least 2 times and cut into small pieces. The chopped flowers were boiled in 50ml of distilled water for 5 minutes. The flower pigment extract was then cooled and filtered. The filtered flower pigment samples collected and stored in air tight bottles at 4°C until further analysis.

iii. **Synthesis of Silver Nanoparticles**

Stock solution was prepared by dissolving 1mM sliver nitrate (AgNO₃; Merck, Chennai, India) and volume made up to 250 ml with distilled water. 5ml of *Mirabilis jalapa* flower extract was added to 100 ml of 1mM AgNO₃ solution and allowed to react at room temperature.

iv. **Test Microorganisms**

The common human pathogenic organisms used (*Staphylococcus*, *Bacillus*, *Streptococcus*, *Salmonella*, *Klebsiella* and *Escherichia coli*). The test organisms were obtained from microbial stock cultures, District hospital Thodupuzha, Idukki, Kerala.

v. **Characterization of Silver Nanoparticles**

**UV–Vis Spectroscopy** the periodic scans of the optical absorbance between 380 and 500nm with a UV- Vis spectrophotometer (Model 118, Systronics, Mumbai, India) at a resolution of 1 nm were performed to investigate the reduction rate of silver ions by *Mirabilis flower* pigment extract. The reaction mixture was diluted 20 times and used for UV-Vis spectrophotometry. Deionised water was used to adjust the baseline.

vi. **Antibacterial Assay**

Nutrient agar and Muller Hinton agar plates were made according to standard microbiological protocol. Filter paper discs of approximately 6 mm diameter were soaked with 10μl, 20μl, 30μl, 40μl, 50μl respectively of the flower pigment extract, AgNO₃ and silver nanoparticle separately and allowed to dry at room temperature for 15 minutes. Muller Hinton Agar plates were prepared and the test microorganisms were inoculated by the spread plate method. Prepared discs were placed in the previously prepared agar plates. Each plate of every test organisms contained discs impregnated with Ag nanoparticle, flower extract, silver nitrate solution and an antibiotic disc. The discs were pressed down to ensure complete contact with the agar surface and distributed evenly so that they were not closer than 24 mm from each other, to Center. The agar plates were then incubated at 37°C. After 16 to 18 hours of incubation, each plate was examined. The resulting zones of inhibition were uniformly circular with a confluent lawn of growth. The diameters of the zones of inhibition were measured, including the diameter of the disc where the antibiotic was used as control (NCCLS, 1997).
III. RESULTS AND DISCUSSION

i. Synthesis of Silver Nanoparticles

After the addition of *Mirabilis jalapa* flower extract to AgNO₃ solution a visible color change from transparent to dark brown was observed which indicates the formation of silver nanoparticle. This occurred due to the reduction of silver ions present in the solution due to terpenoids present in *Mirabilis jalapa* flower extract. After 90 minutes there was no change in the intensity of color developed, which indicates the completion of reduction reaction. The reduced silver particles are in the range of nano size.

ii. Characterization of Silver Nanoparticles

UV Spectrometry: the UV absorption spectrum of silver nanoparticles from *Mirabilis jalapa* flower extract of different concentrations was obtained as given in Figure 2.

iii. Anti-Bacterial Assay

For *Mirabilis jalapa* flower the zone of inhibition was found to be 14-26 mm for *Klebsiella* species, 15-28 mm for *Bacillus* species, 14-211 mm for *E. coli*, 13-27 mm for *Staphylococcus* species, 15-25 mm for *Salmonella* species, and 12-27 mm for *Streptococcus* species. The study done by Gavane et al., (2012) the zone of inhibition found was 14-26 mm for *Klebsiella* species. Silver ions and silver salts are used as antimicrobial agents (Russel et al., 1994). However, the high concentrations of silver salts restrict the use of them in present day medicine. Use of metal nanoparticles decreases the concentration of silver and other metal salts. The bactericidal effect of metal nanoparticles has been attributed to their small size and high surface to volume ratio which allows them to interact closely with microbial membranes and is not merely due to release of metal ions in solution or in culture plates (Morones et al., 2005). The mode of action of both silver nanoparticles and silver ions were reported to be similar, although the nanoparticles were reported to be effective at significantly lower concentration than that of the ions (Morones et al., 2005). According to Lok (2006), the attachment of both silver ions and nanoparticles to the cell membrane caused acclimatization of envelope protein precursors causing dissipation of the protein motive force.

iv. SEM-XRD Analysis

SEM-XRD analysis proved the effective formation of silver nanoparticles in *Mirabilis jalapa* flower pigment extract. SEM-XRD analysis was carried out in instrument JSM 6390 with acceleration voltage 20 kV. SEM reveals information about the sample including external morphology, chemical composition and crystalline structure and orientation of materials making up the sample (Yeo SY and Jeong SH 2003). SEM provides detailed high-resolution images of the sample by rastering a focused electron beam across the surface and detecting secondary or back scattered electron signal. The XRD imaging of the silver nanoparticles was performed to confirm the presence of elemental metal signal and provides quantitative compositional information (Oberdorster G, Oberdorster E and Oberdorster J 2005).

| Streptococcus species| 13    | 12    | 14    | 17    | 23    | 27    |

IV. CONCLUSION

The Mirabilis jalapa flower extract was draw up from fresh flower by boiling it 5 minutes. The prevail extract was of reddish in colour. Freshly prepared flower extract was appended to 1mM silver nitrate solution and the reaction takes place at room temperature which resulted in the synthesis of silver nanoparticles. The synthesized silver nanoparticles were characterized by UV-VIS spectrometry, SEM and XDX measurements. The UV-VIS spectra of silver nanoparticles formed in the reaction media has absorbance peak at 380 nm. It has been indicated that Mirabilis jalapa extract is competent of fabricating silver nanoparticles that shows good firmness in solution. The synthesized silver nanoparticles were distinguished by UV-VIS spectrum, SEM and XDX measurements. This green synthesis method is substitute to chemical method, since it is contemptible, non-polluting and green-friendly. The results showed that Mirabilis jalapa flower plays a salient role in the reduction and stabilization of silver to silver nanoparticles. Further, these synthesized silver nanoparticles from Mirabilis jalapa shows antibacterial activity on human pathogenic bacteria.

Figure 4: Antimicrobial activity of Mirabilis jalapa flower extract green synthesized silver nanoparticles against a) Streptococcus species b) Escherichia coli c) Klebsiella species d) Bacillus species e) Staphylococcus species f) Salmonella species at the concentration of 10µl, 20µl, 30µl, 40µl, 50µl respectively.
V. ACKNOWLEDGMENT
The authors are grateful for the cooperation of the Sree Narayana Guru College of Arts and Sciences for necessary support. We also thank those agronomist and laboratory technicians for proving the majority of samples used in the study.
