AN IMPROVEMENT ON THE BRÉZIS-GALLOUËT TECHNIQUE FOR 2D NLS AND 1D HALF-WAVE EQUATION

TOHRU OZAWA AND NICOLA VISCIGLIA

Abstract. We revise the classical approach by Brézis-Gallouët to prove global well posedness for nonlinear evolution equations. In particular we prove global well–posedness for the quartic NLS posed on general domains \( \Omega \) in \( \mathbb{R}^2 \) with initial data in \( H^2(\Omega) \cap H^1_0(\Omega) \), and for the quartic nonlinear half-wave equation on \( \mathbb{R} \) with initial data in \( H^1(\mathbb{R}) \).

The main aim of this paper is to revise the technique developed by Brézis-Gallouët to study the global well–posedness of Cauchy problems associated with some nonlinear evolution equations. We prove that by the Brézis-Gallouët technique applied to higher order energy with integration by parts, the standard theory developed in [5] and [18] for NLS and half-wave equation with cubic nonlinearity, has an improvement to quartic nonlinearity.

Our first result concerns an extension to higher order nonlinearities of the very classical result in [5]. More precisely the first family of problems that we shall address is the following one:

\[
\begin{cases}
  i \partial_t u + \Delta u = \lambda |u|^3, & (t, x) \in \mathbb{R} \times \Omega, \\
  u(t, x) = 0, & (t, x) \in \mathbb{R} \times \partial \Omega, \\
  u(0) = \varphi,
\end{cases}
\]

where \( \lambda = \pm 1 \), \( \Omega \subset \mathbb{R}^2 \) is open and satisfies the following hypothesis:

(\(H1\)) \( \exists L \in \mathcal{L}(H^2(\Omega), H^2(\mathbb{R}^2)) \cap \mathcal{L}(H^1(\Omega), H^1(\mathbb{R}^2)) \) s.t. \((Lu)_{\Omega} = u \) a.e. in \( \Omega \);

(\(H2\)) \( L^2(\Omega) \supset H^2(\Omega) \cap H^1_0(\Omega) \ni u \mapsto \Delta u \in L^2(\Omega) \) is self-adjoint .

By the celebrate Brézis-Gallouët inequality it follows that if \( \Omega \) satisfies (\(H1\)), then the following logarithmic Sobolev embedding occurs:

\[
\|v\|_{L^\infty(\Omega)} \lesssim \|v\|_{H^1(\Omega)} \sqrt{\ln (2 + \|v\|_{H^2(\Omega)})} + 1, \forall v \in H^2(\Omega).
\]

There has been a growing interest in the last decades on the Cauchy problem associated with NLS on domains, starting from the pioneering paper [5]. In this paper the authors can deduce global well–posedness for the defocusing cubic NLS on domains \( \Omega \subset \mathbb{R}^2 \), by combining (0.2) with the conservation of the energy. A first extension of the result by Brézis-Gallouët, up to the fourth order nonlinearity, was obtained in [21] under some restrictive conditions on the initial data \( \varphi \). More precisely it is assumed \( \varphi, |\varphi| \in H^3(\Omega) \cap H^1_0(\Omega), \Delta \varphi \in H^1_0(\Omega) \). A fundamental tool to treat NLS on domains, with higher order nonlinearities, are the so called Strichartz inequalities (see [8] and the bibliography therein for the case \( \Omega = \mathbb{R}^2 \)). In [6] it is proved a suitable version of Strichartz inequalities with loss, on general compact manifolds. Beside other results in this paper it is studied the Cauchy problem...
associated with NLS on 2D compact manifolds for every nonlinearity \(|u|^{p}|\). The results in [6] have been extended to NLS on domains \(\Omega \subset \mathbb{R}^2\), under suitable assumptions. In particular the case of bounded domains and external domains has been widely investigated in the literature. Just to quote a few of those results we mention [1], [4], [7], [15]....

Due to the huge literature devoted to NLS on 2D domains, Theorem 0.1 below could be considered somewhat weaker compared with the known results, however we prefer to keep its statement along this paper for three reasons. First of all our argument is exclusively based on integration by parts and energy estimates, and hence it is independent on the use of Strichartz estimates. The second reason is that the proof of Theorem 0.1 can help to understand the idea behind the more involved proof of our second result concerning the nonlinear half–wave equation, where as far as we know our result is a novelty in the literature. The third reason is that as far as we know it is unclear whether or not the aforementioned Strichartz estimates are available under the rather general assumptions \((H1), (H2)\).

Let us recall that by the usual energy estimates, in conjunction with the classical Sobolev embedding \(H^2(\Omega) \hookrightarrow L^\infty(\Omega)\), one can prove that the Cauchy problem (0.1) is well posed locally in time provided that \(\varphi \in H^2(\Omega) \cap H^1_0(\Omega)\). More precisely there exists one unique solution \(u \in C([0,T_{\text{max}}); H^2(\Omega) \cap H^1_0(\Omega))\) of (0.1), where \(T_{\text{max}} > 0\). Moreover we have the alternative: either \(T_{\text{max}} = \infty\) or \(T_{\text{max}} < \infty\) and \(\lim_{t \to T_{\text{max}}} \|u(t)\|_{H^1(\Omega)} = \infty\).

The first result of the paper is the following.

**Theorem 0.1.** Let \(\Omega \subset \mathbb{R}^2\) be an open set that satisfies \((H1), (H2)\), \(\varphi \in H^2(\Omega) \cap H^1_0(\Omega)\) and let \(u \in C([0,T_{\text{max}}); H^2(\Omega) \cap H^1_0(\Omega))\) be the unique local solution of (0.1). Then we have the following alternative: either \(T_{\text{max}} = \infty\) or \(T_{\text{max}} < \infty\) and \(\sup_{0 \leq t < T_{\text{max}}} \|u(t)\|_{H^1(\Omega)} = \infty\).

Next we give some concrete conditions on the initial data \(\varphi\) in order to guarantee global well–posedness of (0.1). We need to introduce the energy preserved along (0.1) for \(\lambda = \pm 1\):

\[
E_{NLS, \pm}(u) = \frac{1}{2} \int_{\Omega} |\nabla u|^2 dx + \frac{1}{5} \int_{\Omega} |u|^5 dx.
\]

We also introduce the ground state \(Q(|x|)\) defined as the unique solution to

\[-\Delta Q + Q = Q^4, \quad Q \in H^1(\mathbb{R}^2), \quad Q > 0.\]

We are now in a position to state the following global well–posedness result.

**Corollary 0.1.** Let \(\Omega\) be as in Theorem 0.1 and \(\varphi \in H^2(\Omega) \cap H^1_0(\Omega)\).

If \(\lambda = 1\) then (0.1) has one unique global solution \(u \in C([0, \infty); H^2(\Omega) \cap H^1_0(\Omega))\).

If \(\lambda = -1\) and \(\varphi\) satisfies:

\[
E_{NLS, -}(\varphi) \|\varphi\|^4_{L^2} < E_{NLS, -}(Q) \|Q\|^4_{L^2},
\]

and

\[
\|\nabla \varphi\|_{L^2} \|\varphi\|^2_{L^2(\Omega)} < \|\nabla Q\|_{L^2} \|Q\|^2_{L^2},
\]

then (0.1) has one unique global solution \(u \in C([0, \infty); H^2(\Omega) \cap H^1_0(\Omega))\).

The proof of Corollary 0.1 follows by Theorem 0.1 in conjunction with the conservation of the energy (0.3). In fact in the defocusing case, since the energy is
positive definite, it prevents blow-up of the $H^1$ norm. In the focusing case a combination of the conservation of the energy with conditions (0.4), prevents blow-up of the $H^1$-norm via a standard continuity argument (see [14] for details).

The second family of Cauchy problems that we consider in this paper is associated with the fourth order nonlinear half-wave equation:

\[
\begin{aligned}
  
  \left\{ \begin{array}{l}
   i\partial_t u - |D_x|u = \lambda u|u|^3, \quad (t, x) \in \mathbb{R} \times \mathbb{R}, \\
   u(0) = \varphi \in H^1(\mathbb{R}),
  \end{array} \right.
\]

where $|D_x| = \sqrt{-\partial_x^2}$ is the first order non-local fractional derivative, $\lambda = \pm 1$. Let us mention that evolution problems with nonlocal dispersion arise in various physical settings (see [9], [19], [11], [17]). In the case of a cubic nonlinearity, the Cauchy problem (0.5) is strictly related with the Szegö model (see [12], [20]).

We recall that by standard arguments one can prove the existence of one unique solution $u \in C([0, T_{\text{max}}); H^1(\mathbb{R}))$ of (0.5), where $T_{\text{max}} > 0$. Moreover we have the alternative: either $T_{\text{max}} = \infty$ or $T_{\text{max}} < \infty$ and $\lim_{t \to T_{\text{max}}^-} \|u(t)\|_{H^1(\mathbb{R})} = \infty$.

We can state our second result.

**Theorem 0.2.** Let $u \in C([0, T_{\text{max}}); H^1(\mathbb{R}))$ be the unique local solution of (0.5). Then we have the following alternative: either $T_{\text{max}} = \infty$ or $T_{\text{max}} < \infty$ and $\sup_{[0, T_{\text{max}})} \|u(t)\|_{H^1(\mathbb{R})} = \infty$.

Next we give some concrete conditions on the initial data $\varphi$ in order to guarantee global well-posedness of (0.5). We need to introduce the energy preserved along (0.5) for $\lambda = \pm 1$:

\[
E_{HW,\pm}(u) = \frac{1}{2} \int_\mathbb{R} |D_x|^{\frac{3}{2}} u^2 dx \pm \frac{1}{5} \int_\mathbb{R} |u|^5 dx.
\]

We also introduce $R \in H^{\frac{3}{2}}(\mathbb{R})$ as the unique (non trivial) optimizer of the following Gagliardo-Nirenberg inequality

\[
\|f\|_{L^5(\mathbb{R})} \leq C_{GN}\|D_x^{\frac{3}{2}} f\|_{L^2(\mathbb{R})}^{\frac{3}{2}} \|f\|_{L^2(\mathbb{R})}^{\frac{1}{2}},
\]

that satisfies

\[
|D_x| R + R = R^4, \quad R(x) = R(|x|) > 0.
\]

The uniqueness of $R$ defined as above is proved in [10] (concerning a general proof on the existence of optimizers for Gagliardo-Nirenberg inequalities see [2]).

The next result is a version Corollary 0.1 in the context of the half-wave equation.

**Corollary 0.2.** Assume $\lambda = 1$ then (0.5) has one unique global solution $u \in C([0, \infty); H^1(\mathbb{R}))$.

Assume $\lambda = -1$ and $\varphi$ satisfies:

\[
E_{HW,-}(\varphi) \|\varphi\|_{L^2}^2 < E_{HW,-}(R) \|R\|_{L^2}^2
\]

and

\[
\|D_x^{\frac{3}{2}} \varphi\|_{L^2} \|\varphi\|_{L^2(\mathbb{R})}^2 < \|D_x^{\frac{3}{2}} R\|_{L^2} \|R\|_{L^2},
\]

then (0.5) has one unique global solution $u \in C([0, \infty); H^1(\mathbb{R}))$. 

Along the paper we shall present a proof of Corollary 0.2. Of course in the
defocusing case it follows by Theorem 0.2 in conjunction with the fact that the
energy $E_{H^*}$ is positive definite. In the focusing case the proof is more involved
and we need to adapt the argument in [14] in a non-local context.

The global well–posedness results above can be considered as an extension to
the quartic half–wave equation of part of the results proved by Krieger-Lenzmann-
Raphael in [18]. In this paper in fact the authors treat, beside very interesting
blow-up results, the Cauchy theory for the half-wave equation with cubic nonlin-
earity via the classical approach in [5]. We should also notice that in [18] the
authors work in $H^2(\mathbb{R})$, while in Theorem 0.2 we work in $H^1(\mathbb{R})$.

A basic tool along the proof of Theorem 0.2 will be the following version of (0.2):

\[
\|v\|_{L^\infty(\mathbb{R})} \lesssim \|v\|_{H^1(\mathbb{R})} \sqrt{\ln (2 + \|v\|_{H^1(\mathbb{R})}) + 1}, \forall v \in H^1(\mathbb{R}).
\]

Its proof follows by a straightforward adaptation of the argument in [5]. Hence we
skip it and we shall make an extensive use of (0.10) without any further comment.

Acknowledgment: N.V. is supported by the FIRB project Dinamiche Dispersive.
The authors are grateful to N. Tzvetkov for interesting comments.

1. PROOF OF THEOREM 0.1

Along this section we use the notations:

\[
\nabla u = (\partial_x u, \partial_y u), \Delta = \partial_x^2 + \partial_y^2, (f, g) = \int_{\Omega} f \cdot \bar{g} \, dx, L^2 = L^2(\Omega), H^k = H^k(\Omega).
\]

We also introduce the following energy:

\[
\mathcal{E}(u) = \|\Delta u\|_{L^2}^2 - 2\mathcal{R}e(\Delta u, u|u|^3) - \frac{3}{4}\lambda(\nabla|u|^2, \nabla(|u|^2)|u|).
\]

Lemma 1.1. Let $u$ be as in Theorem 0.1, then we have the following identity:

\[
\frac{d}{dt}(\mathcal{E}(u) + \|u\|_{L^2}^2) = -2\lambda^2 \Im(\nabla u, u \nabla(|u|^6)) + \frac{3}{4}\lambda(\nabla|u|^2, \partial_t|u|)) + 2\lambda(\nabla|u|^2, \partial_t(|u|^3)).
\]

Proof. Recall that $\frac{d}{dt}\|u\|_{L^2}^2 = 0$, hence we shall treat $\frac{d}{dt}\mathcal{E}(u)$. Next we assume that
the solution $u$ is regular enough in order to justify all the computations. In the case
that the solution $u$ is only $H^2$, then one can proceed by a smoothing argument
via the Yosida regularization (we skip this technical but standard regularization
argument).

We start with the following computation:

\[
\frac{d}{dt}\|\Delta u\|_{L^2}^2 = 2\mathcal{R}e(\Delta \partial_t u, \Delta u) = 2\mathcal{R}e(\Delta \partial_t u, -i\partial_x u + \lambda u|u|^3)
\]

\[
= 2\lambda\mathcal{R}e(\Delta \partial_t u, u|u|^3) = 2\lambda \frac{d}{dt}\mathcal{R}e(\Delta u, u|u|^3) - 2\lambda\mathcal{R}e(\Delta u, \partial_t(u|u|^3)),
\]
where we used the equation solved by \( u \) in the second equality. Next notice that

\[
\Re(\Delta u, \partial_t (|u|^3)) = \Re(\Delta u, \partial_t u|u|^3) + \Re(\Delta u, u\partial_t(|u|^3))
\]

\[
= \Re(\Delta u, \partial_t u|u|^3) + \frac{1}{2}(\Delta|u|^2, \partial_t(|u|^3)) - (|\nabla u|^2, \partial_t(|u|^3)) = I + II + III.
\]

By using the equation solved by \( u \) we get

\[
I = \Re(\Delta u, -i\lambda u|u|^6) = \lambda \Im(\nabla u, u\nabla(|u|^6)).
\]

Moreover we have

\[
II = -\frac{1}{2}(\nabla|u|^2, \partial_t (|u|^3)) - \frac{3}{4}(\nabla|u|^2, \partial_t (\nabla(|u|^2)|u|))
\]

\[
= -\frac{3}{4} \frac{d}{dt}(\nabla|u|^2, \nabla(|u|^2)|u|) + \frac{3}{4}(\partial_t \nabla |u|^2, \nabla(|u|^2)|u|)
\]

\[
= -\frac{3}{4} \frac{d}{dt}(\nabla|u|^2, \nabla(|u|^2)|u|) + \frac{3}{8}(\partial_t |\nabla|u|^2|^2, |u|)
\]

\[
= -\frac{3}{4} \frac{d}{dt}(\nabla|u|^2, \nabla(|u|^2)|u|) + \frac{3}{8} \frac{d}{dt}(|\nabla |u|^2|^2, |u|) - \frac{3}{8}(|\nabla |u|^2|^2, \partial_t |u|).
\]

\[
\square
\]

**Lemma 1.2.** Let \( u \) be as in Theorem 0.1 and \( U = \sup_{[0,T_{\text{max}}]} \|u(t)\|_{H^1} \), then we have:

\[
\frac{d}{dt}(\mathcal{E}(u) + \|u\|_{L^2}^2) \lesssim U^8 \ln^3(2 + \|u\|_{H^2})
\]

\[
+ U^3 \|\Delta u\|_{L^2}^2 \ln(2 + \|u\|_{H^2}) + U^2 + U\|\Delta u\|_{L^2}^2, \quad \forall t \in [0,T_{\text{max}}).
\]

**Proof.** Next we collect some useful inequalities satisfied by any solution \( u \) of (0.1):

\[
\Im(\nabla u, u\nabla(|u|^6))) \lesssim \int |\nabla u|^2 \cdot |u|^6 dx
\]

\[
\lesssim \|u\|_{H^1}^2 \|u\|_{L^6}^6 \lesssim \|u\|_{H^1}^8 \ln^3(2 + \|u\|_{H^2}) + \|u\|_{H^1}^2,
\]

where we used (0.2). We also have

\[
\int |\nabla|u|^2|^2 \cdot |\partial_t |u|| dx \lesssim \int |\nabla u|^2 \cdot |u|^6 dx + \int |\nabla u|^2 \cdot |\Delta u| \cdot |u|^2 dx,
\]

where we used the diamagnetic inequality \( |\partial_t |u|| \leq |\partial_t u| \) and the equation solved by \( u \). By combining the Hölder inequality, the logarithmic Sobolev embedding (0.2) and the Gagliardo-Nirenberg inequality

\[
\|\nabla u\|_{L^4} \lesssim \|\Delta u\|_{L^2}^\frac{1}{2} \|\nabla u\|_{L^2}^{\frac{1}{2}},
\]

we can continue the estimate above as follows:

\[
\ldots \lesssim \|u\|_{H^1}^8 \ln^3(2 + \|u\|_{H^2}) + \|u\|_{H^1}^2 + \|\Delta u\|_{L^2}^2 \|u\|_{H^1}^3 \ln(2 + \|u\|_{H^2}) + \|\Delta u\|_{L^2}^2 \|u\| = I + II + III.
\]

Finally notice that (by using the equation solved by \( u \))

\[
\int |\nabla u|^2 \cdot \partial_t (|u|^3) dx \lesssim \int |\nabla u|^2 \cdot |u|^6 + \int |\nabla u|^2 \cdot |\Delta u| \cdot |u|^2 dx,
\]

and we can continue as in (1.4).

\[
\square
\]
Proof of Theorem 0.1 Assume by the absurd that
\[ T_{\text{max}} < \infty \] and \[ U = \sup_{t \in [0, T_{\text{max}}]} \| u \|_{H^1} < \infty. \]

By elementary computations we get:
\[ |(\nabla |u|^2, \nabla (|u|^2)|u)| \lesssim \left(\int |\nabla u|^4 dx\right)^{1/2} \cdot \left(\int |u|^6 dx\right)^{1/2} \lesssim U^4 \| \Delta u \|_{L^2}, \]
where we used (1.5), and we also have
\[ |(\Delta u, u|u|^3)| \lesssim \| \Delta u \|_{L^2} \| u \|_{L^3}^4 \lesssim U^4 \| \Delta u \|_{L^2}. \]

Hence
\[ \| u \|^2_{H^2} \lesssim \mathcal{E}(u) + \| u \|^2_{L^2}, \quad \text{for } \| u \|_{H^2} > R = R(U) > 0. \]

Next recall that by definition of \( T_{\text{max}} \) we have \( \| u(t) \|_{H^2} > R, \ \forall t > \bar{T} \in (0, T_{\text{max}}). \)

Hence by combining (1.6) with (1.3) we get:
\[
\begin{align*}
\| u(t) \|^2_{H^2} & \leq \| u(\bar{T}) \|^2_{H^2} + U^8 \int_\bar{T}^t \ln^3 (2 + \| u \|_{H^2}) dt + U^3 \int_\bar{T}^t \| u \|^2_{H^2} \ln (2 + \| u \|_{H^2}) dt \\
& + U \int_\bar{T}^t \| u \|^2_{L^2} dt + U^2 (t - \bar{T}), \quad \forall t \in [\bar{T}, T_{\text{max}}].
\end{align*}
\]

We are in a position to conclude, arguing as in [5], that \( \sup_{t \in [0, T_{\text{max}}]} \| u(t) \|_{H^2} < \infty, \)
and hence we get a contradiction with the definition of \( T_{\text{max}}. \)

\[ \square \]

2. The half-wave equation

Along this section we use the notations:
\[ |D_x|^s = (\sqrt{-\partial_x^2})^s, \quad (f, g) = \int_{\mathbb{R}} f \cdot g \, dx, \quad L^p = L^p(\mathbb{R}), \quad H^k = H^k(\mathbb{R}). \]

We also introduce the energy
\[ \mathcal{F}(u) = \| \partial_x u \|^2_{L^2} + 2\lambda \text{Re}(\langle D_x |u, u|u|^3 \rangle) - \frac{3}{4} \lambda \langle |D_x|^2 |u|^2, |u| \rangle + \lambda \langle |D_x|^2 |u|^2 - \bar{u} |D_x|^2 \bar{u}, |D_x|^2 |u|^3 \rangle. \]

The following proposition will be crucial in the sequel.

Proposition 2.1. (See [16]) We have the following estimate:
\[ \| |D_x|^s (fg) - g|D_x|^s f - f|D_x|^s g \|_{L^p} \lesssim \| |D_x|^s f \|_{L^q} \| |D_x|^s g \|_{L^r}, \]
where
\[ \frac{1}{p} = \frac{1}{q} + \frac{1}{r}, \quad 1 < p, q, r < \infty, \quad 1 > s = s_1 + s_2 > 0, \quad s_1, s_2 \geq 0. \]
Lemma 2.1. Let $u$ be as in Theorem 0.2. Then we have the following identity:

\begin{equation}
\frac{d}{dt}(\|u\|_{L^2}^2) = -2\lambda^2 \Im(|D_x|u, u|u|^6) + 2\lambda(|D_x|\hat{u}|u|^2, \partial_t(|u|^3))
\end{equation}

\begin{align*}
&+ \lambda(|D_x|\hat{u}^2 - \partial_t(\bar{u}|D_x|\hat{u}^2) - \partial_t(u|D_x|\hat{u}^2)|D_x|\hat{u}|u|^3)) \\
&+ \frac{1}{2}(\|D_x|\hat{u}|u|^2 - \bar{u}|D_x|\hat{u}^3 - u|D_x|\hat{u}^2, |D_x|\hat{u}^2|\partial_t(|u|^3)) \\
&+ \frac{3}{4}\lambda(|D_x|\hat{u}|u|^2, |D_x|\hat{u}|\partial_t(|u|^3)|u) - |u||D_x|\hat{u}|\partial_t(|u|^2) - |\partial_t(|u|^2)||D_x|\hat{u}|u|)
\end{align*}

Proof. Recall that $\frac{d}{dt}||u||_{L^2}^2 = 0$, hence we shall treat $\frac{d}{dt}F(u)$. In the sequel we assume that the solution is regular enough in order to justify the following computations. The proof in the case of lower regular solutions (i.e. $H^1$ solutions), can be done by a standard density argument. However we skip the details.

We make the following computation

\begin{align*}
\frac{d}{dt}\|\partial_t u\|_{L^2}^2 = 2\Re(|D_x|\partial_t u, |D_x|u) = 2\Re(|D_x|\partial_t u, i\partial_t u - \lambda u|u|^3) \\
&= -2\lambda^2 \Re(|D_x|u, u|u|^3) = \Re(|D_x|u, \partial_t u|u|^3) + \Re(|D_x|u, u\partial_t(|u|^3)) = I + II.
\end{align*}

Concerning $I$ we get (by using the equation solved by $u$)

\begin{align*}
I = -\lambda \Im(|D_x|u, u|u|^6),
\end{align*}

and for $II$ we have

\begin{align*}
II &= \Re(|D_x|\hat{u}, |D_x|\hat{u}^2|\partial_t(|u|^3)) \\
&= \Re(|D_x|\hat{u}, |D_x|\hat{u}^2|\partial_t(|u|^3)) + \Re(|D_x|\hat{u}, u|D_x|\hat{u}^2|\partial_t(|u|^3)) \\
&+ \Re(|D_x|\hat{u}, |D_x|\hat{u}^2|\partial_t(|u|^3)) - |D_x|\hat{u}^2|\partial_t(|u|^3) - u|D_x|\hat{u}^2|\partial_t(|u|^3)),
\end{align*}

that can be written as (recall $\partial_t(|u|^3) = \frac{3}{2}\partial_t(|u|^2)|u$)

\begin{align*}
\frac{3}{4}\Re(|D_x|\hat{u}, |D_x|\hat{u}^2|\partial_t(|u|^3)) = \frac{3}{4}(\Re(|D_x|\hat{u}, |D_x|\hat{u}^2|\partial_t(|u|^2)|u) \\
&+ \frac{1}{4}\Re(|D_x|\hat{u}, |D_x|\hat{u}^2|\partial_t(|u|^3)) - |D_x|\hat{u}^2|\partial_t(|u|^3) - u|D_x|\hat{u}^2|\partial_t(|u|^3))
\end{align*}

Next notice that

\begin{align*}
II_1 &= \frac{3}{4}(\Re(|D_x|\hat{u}, |D_x|\hat{u}^2|\partial_t(|u|^2)|u) \\
&+ \frac{3}{4}(\Re(|D_x|\hat{u}, |D_x|\hat{u}^2|\partial_t(|u|^2)|u) - |u||D_x|\hat{u}^2|\partial_t(|u|^2) - |\partial_t(|u|^2)||D_x|\hat{u}|u|)
\end{align*}
and hence
\[ ... = \frac{3}{8} \partial_t \|D_x \|^{\frac{1}{2}} (\|u^2\|)^2, \|u\|) + \frac{3}{4} (\|D_x \|^{\frac{1}{2}} u^2, \|D_x \|^{\frac{1}{2}} u \partial_t (\|u^2\|)) \\
+ \frac{3}{4} (\|D_x \|^{\frac{1}{2}} (\|u^2\|), \|D_x \|^{\frac{1}{2}} (\partial_t (\|u^2\|))u) - |u| \|D_x \|^{\frac{1}{2}} \partial_t (\|u^2\|) - \partial_t (\|u^2\|) \|D_x \|^{\frac{1}{2}} u) \\
= \frac{3}{8} \frac{d}{dt} \|D_x \|^{\frac{1}{2}} (\|u^2\|)^2, \|u\|) \\
- \frac{3}{8} (\|D_x \|^{\frac{1}{2}} u^2, \partial_t |u|) + \frac{3}{4} (\|D_x \|^{\frac{1}{2}} (\|u^2\|), \|D_x \|^{\frac{1}{2}} u \partial_t (\|u^2\|)) \\
+ \frac{3}{4} (\|D_x \|^{\frac{1}{2}} (\|u^2\|), \|D_x \|^{\frac{1}{2}} (\partial_t (\|u^2\|))u) - |u| \|D_x \|^{\frac{1}{2}} \partial_t (\|u^2\|) - \partial_t (\|u^2\|) \|D_x \|^{\frac{1}{2}} u).
\]
Moreover we have
\[ \begin{aligned}
I_{13} &= -\frac{1}{2} \frac{d}{dt} (\|D_x \|^{\frac{1}{2}} u^2) - \bar{u} |D_x |^{\frac{1}{2}} u - u |D_x |^{\frac{1}{2}} \bar{u}, |D_x |^{\frac{1}{2}} (\|u^3\|)) \\
&+ \frac{1}{2} (\|D_x \|^{\frac{1}{2}} \partial_t (\|u^2\|) - \partial_t (\bar{u} |D_x |^{\frac{1}{2}} u) - \partial_t (u |D_x |^{\frac{1}{2}} \bar{u}), |D_x |^{\frac{1}{2}} (\|u^3\|)).
\end{aligned} \]

\[ \square \]

**Lemma 2.2.** Let \( u \) be as in Theorem 0.2 and let \( U = \sup_{[0,T_{\max}]} \|u(t)\|_{H^{\frac{1}{2}}} \), then we have
\[ \frac{d}{dt} (\|F(u) + u\|_{L^2}^2) \lesssim (1 + U)^6 \|u\|_{H^1}^2 \ln(2 + \|u\|_{H^1}). \]

**Proof.** It follows by combining the estimates below with Lemma 2.1. More precisely we shall prove that all the term on the r.h.s. in (2.2) can be estimated by \((1 + U)^6 \|u\|_{H^1}^2 \ln(2 + \|u\|_{H^1}). \)

First notice that
\[ |\text{Im} (\|D_x | |u^3\|)| \lesssim \|u\|_{H^1} \|u\|_{H^{\frac{1}{2}}} \|u\|_{L^2} \lesssim \|u\|_{H^1}^2 \|u\|_{H^{\frac{1}{2}}} \lesssim \|u\|_{H^1}^2 U^6. \]

On the other hand
\[ \|\|D_x |^{\frac{1}{2}} |u^2\|, \partial_t (\|u^3\|)\| \lesssim \|\|D_x |^{\frac{1}{2}} u^2\|_{L^2} \|\partial_t u\|_{L^2} \|\|u\|_{L^2}^2 \|_{L^\infty}, \]

that by (10.10) and the following Gagliardo-Nirenberg inequality
\[ (2.5) \|\|D_x |^{\frac{1}{2}} u^2\|_{L^2} \lesssim \|\|D_x | u\|_{L^2} \|\|D_x |^{\frac{1}{2}} u\|_{L^2}, \]
implies
\[ \begin{aligned}
\|u\|_{H^1} \|u\|_{H^{\frac{1}{2}}} \|\partial_t u\|_{L^2} \ln(2 + \|u\|_{H^1}) + \|u\|_{H^1} \|u\|_{H^{\frac{1}{2}}} \|\partial_t u\|_{L^2}.
\end{aligned} \]

By looking at the equation solved by \( u \)
\[ \begin{aligned}
\|u\|_{H^1} \|u\|_{H^{\frac{1}{2}}} (\|u\|_{H^1}^2 + \|u\|_{L^2}^3) \ln(2 + \|u\|_{H^1}) + \|u\|_{H^1} \|u\|_{H^{\frac{1}{2}}} (\|u\|_{H^1}^2 + \|u\|_{L^2}^3).
\end{aligned} \]

Next notice that if we develop by the classical Leibniz rule the derivative with respect to the time variable and we apply twice Proposition 2.1 (where \( s = s_1 = \frac{1}{2}, s_2 = 0, p = \frac{1}{2}, q = 2, r = 4 \)) we get:
\[ \begin{aligned}
|\|D_x |^{\frac{1}{2}} \partial_t (|u^2\|) - \partial_t (\bar{u} |D_x |^{\frac{1}{2}} u) - \partial_t (u |D_x |^{\frac{1}{2}} \bar{u}), |D_x |^{\frac{1}{2}} (\|u^3\|)| \\
\lesssim \|\partial_t u\|_{L^2} \|\|D_x |^{\frac{1}{2}} u\|_{L^2} \|\|D_x |^{\frac{1}{2}} (\|u^3\|)\|_{L^1} \lesssim \|\partial_t u\|_{L^2} \|\|u\|_{H^1} \|u\|_{H^{\frac{1}{2}}} \|u\|_{H^1}^2 \|u\|_{H^{\frac{1}{2}}} \|u\|_{H^1} |u^3|_{H^{\frac{1}{2}}} \|u^3|_{H^{\frac{1}{2}}} \|u^3|_{H^{\frac{1}{2}}}
\lesssim \|\|D_x |^{\frac{1}{2}} u\|_{L^2} \|\|u\|_{H^1} \|u\|_{L^2}^3 \|u\|_{L^\infty}.
\end{aligned} \]

Notice that we have used (2.5) and the property
\[ \begin{aligned}
\|v \cdot w\|_{H^{\frac{1}{2}}} \lesssim \|v\|_{H^1} \|w\|_{L^\infty} + \|w\|_{H^{\frac{1}{2}}} \|v\|_{L^\infty}.
\end{aligned} \]
We conclude by using (0.10) and the equation solved by $u$.

Next we use again Proposition 2.1 (where $s = s_1 = \frac{1}{2}$, $s_2 = 0$, $p = \frac{1}{2}$, $q = 2$, $r = 4$),
\[
|(|D_x|^\frac{1}{2}u, |D_x|^\frac{1}{2}u|) - |D_x|^\frac{1}{2}u|D_x|^\frac{1}{2}u|)|| 
\leq |||D_x|^\frac{1}{2}u||^2_{L^2}||\partial_t(|u|^2)||_{L^2} 
\leq ||u||_{H^1}||u||_{H^\frac{1}{2}}||\partial_t u||_{L^2}||u||_\infty^2,
\]
where we used (2.5). We conclude by using (0.10) and the equation solved by $u$.

By Hölder inequality we get
\[
|(|D_x|^\frac{1}{2}(|u|^2), |D_x|^\frac{1}{2}|u|\partial_t(|u|^2)|)| 
\leq |||D_x|^\frac{1}{2}(|u|^2)||^2_{L^2}||\partial_t u||_{L^2} 
\leq ||u||_{H^1}||u||_{H^\frac{1}{2}}||\partial_t u||_{L^2}||u||_\infty^2,
\]
where we have used (2.5) and (2.6). We conclude as above.

Next we have the estimate
\[
|(|D_x|^\frac{1}{2}(|u|^2), |D_x|^\frac{1}{2}|u|\partial_t(|u|^2)|)| 
\leq |||D_x|^\frac{1}{2}(|u|^2)||^2_{L^2}||\partial_t u||_{L^2}||u||_{L^\infty},
\]
(2.7) where we used (2.5). By (2.6) we get
\[
\ldots \leq ||u||_{H^1}||u||_{H^\frac{1}{2}}||\partial_t u||_{L^2},
\]
and we conclude by using the equation solved by $u$ in conjunction with (0.10).

Finally by Proposition 2.1 and the Hölder inequality we get the following estimate:
\[
|(|D_x|^\frac{1}{2}(|u|^2), |D_x|^\frac{1}{2}|u|\partial_t(|u|^2)|)| 
\leq |||D_x|^\frac{1}{2}(|u|^2)||^2_{L^2}||\partial_t u||_{L^2}||u||_{L^\infty}
\]
and by (2.5)
\[
\ldots \leq ||u||_{H^1}||u||_{H^\frac{1}{2}}||\partial_t u||_{L^2}||u||_{L^\infty},
\]
which is precisely the term in (2.7), hence we can conclude as above.

\[\square\]

**Proof of Theorem 0.2** It is similar to the proof of Theorem 0.1, provided that we use Lemma 2.2 and we show that
\[
|\mathcal{F}(u) + ||u||^2_{L^2} - ||u||^2_{H^1}| \leq C(U)(1 + ||u||_{H^1}) \ln \frac{r}{2} (2 + ||u||_{H^1}).
\]
This last fact follows from the following computations. First notice that
\[
|(|D_x||u, u||u^3||)| \leq ||D_x||u||_{L^2}||u||^4_{L^\infty} \leq ||u||_{H^1}||u||^4_{H^\frac{1}{2}}.
\]
Moreover we have
\[
|(|D_x|^\frac{1}{2}(|u|^2), |u||)| \leq |||D_x|^\frac{1}{2}(|u|^2)||^2_{L^2}||u||_{L^2} 
\leq ||u||^2_{H^\frac{1}{2}}||u||^2_{L^2}||u||_{L^\infty} \leq ||u||^4_{L^\infty}||u||_{H^1}||u||^2_{H^\frac{1}{2}},
\]
where we used (2.5) and (2.6). We conclude by (0.10). Finally notice that
\[
|(|D_x|^\frac{1}{2}|u|^2 - \bar{u}|D_x|^\frac{1}{2}u - u|D_x|^\frac{1}{2}\bar{u} - D_x|^\frac{1}{2}(|u|^3)|)| 
\leq ||D_x|^\frac{1}{2}|u|^2||_{L^2}||D_x|^\frac{1}{2}(|u|^3)||_{L^4} + ||u||_{L^2}||D_x|^\frac{1}{2}|u||_{L^4}||D_x|^\frac{1}{2}(|u|^3)||_{L^4}
\]
and hence by (2.5)
\[
\ldots \leq ||u||^2_{H^\frac{1}{2}}||u^3||_{H^\frac{1}{2}} + ||u||_{L^2}||u||^2_{H^\frac{1}{2}}||u||^2_{H^\frac{1}{2}}||u||^2_{H^\frac{1}{2}}||u||^3_{H^\frac{1}{2}}
\leq ||u||^2_{H^\frac{1}{2}}||u||^3_{L^\infty} + ||u||_{L^2}||u||_{H^1}||u||^2_{H^\frac{1}{2}}||u||^2_{L^\infty},
\]
where we used (2.6). We conclude again by (0.10).

\[ \square \]

3. Proof of Corollary 0.2

The case \( \lambda = 1 \) follows by combining the conservation of the energy \( \mathcal{E}_{HW, +} \) (which is positive definite) with Theorem 0.2.

Concerning the case \( \lambda = -1 \) it is sufficient to show that \( \|u(t)\|_{\dot{H}^{1/2}} \) cannot blow up in finite time under the assumptions of Corollary 0.2.

Notice that by combining the conservation of the mass and the energy, with the assumption \( E_{HW, -}(R)\|R\|_{L^2}^4 > E_{HW, -}(\varphi)\|\varphi\|_{L^2}^4 \), we get

\[ E_{HW, -}(R)\|R\|_{L^2}^4 > E_{HW, -}(u(t))\|u(t)\|_{L^2}^4 \]

\[ = \frac{1}{2}\left(\|D_x\frac{1}{2}u(t)\|_{L^2}^2\|u(t)\|_{L^2}^2 - \frac{1}{5}\|u(t)\|_{L^2}^5\|u(t)\|_{L^2}^2\right). \]

By the following Gagliardo–Nirenberg inequality

\[ \|g\|_{L^5(R)} \leq C_{GN}\|D_x\frac{1}{2}g\|_{L^2(R)}^{\frac{3}{2}}\|g\|_{L^2(R)}^{\frac{1}{2}} \]

we get

\[ \geq \frac{1}{2}\left(\|D_x\frac{1}{2}u(t)\|_{L^2}^2\|u(t)\|_{L^2}^2 - \frac{1}{5}\|u(t)\|_{L^2}^5\|u(t)\|_{L^2}^2\right)^3. \]

Hence \( \|D_x\frac{1}{2}u(t)\|_{L^2}^2\|u(t)\|_{L^2}^2 \) belongs to the sublevel

\[ \mathcal{A} = \{x \in \mathbb{R}^d | f(x) < E_{HW, -}(R)\|R\|_{L^2}^4\}, \]

where \( f(x) = \frac{1}{5}x^2 - \frac{1}{5}C_{GN}^5 x^3 \). Next we denote by \( x_{\text{max}} > 0 \) the unique point where the maximum of \( f \) is achieved on \((0, \infty)\). We claim that

\[ x_{\text{max}} = \|D_x\frac{1}{2}R\|_{L^2}^2\|R\|_{L^2}^2 \text{ and } f(x_{\text{max}}) = E_{HW, -}(R)\|R\|_{L^2}^4. \]

If this is the case then we get

\[ \mathcal{A} = \mathcal{A}_1 \cup \mathcal{A}_2, \]

where

\[ \mathcal{A}_1 = (0, \|D_x\frac{1}{2}R\|_{L^2}^2\|R\|_{L^2}^2) \text{ and } \mathcal{A}_2 = (\|D_x\frac{1}{2}R\|_{L^2}^2\|R\|_{L^2}^2, \infty), \]

and we conclude by a continuity argument.

First notice that by the analysis of \( f' \) we get

\[ x_{\text{max}} = \frac{5}{3C_{GN}^5} \]

and also since \( R \) is an optimizer for (3.2), then

\[ E_{HW, -}(R)\|R\|_{L^2}^4 = \frac{1}{2}\left(\|D_x\frac{1}{2}R\|_{L^2}^2\|R\|_{L^2}^2 - \frac{1}{5}\|D_x\frac{1}{2}R\|_{L^2}^5\|R\|_{L^2}^2\right)^3. \]

Hence (3.3) follows provided that we prove

\[ \frac{5}{3C_{GN}^5} = \|D_x\frac{1}{2}R\|_{L^2}^2\|R\|_{L^2}^2. \]

To prove this fact notice that since \( R \) is an optimizer for (3.2) we get

\[ \frac{d}{dt}\left(\int |R + t\varphi|^5 dx - C_{GN}^5\|D_x\frac{1}{2}(R + t\varphi)\|_{L^2}^2\|R + t\varphi\|_{L^2}^2\right)_{t=0} = 0, \quad \forall \varphi \in H^{1/2} \]
and hence by direct computations it implies
\[-(3C_5^5 \| R \|^2_{L^2} \| D_x \|^2_{L^2}) D_x R - (2C_5^5 \| D_x \|^2_{L^2}) R + 5R^4 = 0.\]
Since $R$ solves (0.8) we deduce that
\[3C_5^5 \| R \|^2_{L^2} \| D_x \|^2_{L^2} = 2C_5^5 \| D_x \|^2_{L^2} = 5\]
and hence we get (3.4). Notice that (3.5) follows by the fact that $R$ cannot be a solution to $|D_x| R + aR = bR^4$ unless $a = b = 1$. In fact if it not the case then, since $R$ solves (0.8), we would get $(b - 1)R^4 = (a - 1)R$ that implies $R$ is a constant.
