Dear Editor,

Ursolic acid (3-beta-3-hydroxy-urs-12-ene-28-oic-acid; UA) is a lipophilic pentacyclic triterpenoid; it was found to be present in the epicuticular waxes of apples in 1920. It is widely found naturally in the peels of fruits, as well as in many herbs and spices such as lavender, oregano, thyme, rosemary, and thyme (Woźniak et al., 2015). UA has been confirmed to have several biological and pharmacological effects, such as anti-inflammatory (Baricevic et al., 2001), antitumor (Baglin et al., 2003), antiplatelet aggregation (Babalola et al., 2013), anti-HIV (Kashiwada et al., 2000), and anti-Mycobacterium tuberculosis effects (Cantrell et al., 2001).

Its many pharmaceutical and biological properties make it an interesting material for application in the pharmaceutical, food, and cosmetics industries. Herein, we review the most recent studies on UA and its biological and pharmacological activities (Table 1).

Table 1: Recent studies on ursolic acid and its biological and pharmacological activities

| Key message | Reference |
|-------------|-----------|
| Ursolic acid (UA) not only inhibits cell growth but also induces apoptosis through modulation of the phosphatidylinositol-3-kinase (PI3K)/Akt/mTOR pathway in human prostate cancer cells. This finding suggests that UA may be a new chemotherapeutic candidate against prostate cancer. | Meng et al., 2015 |
| The antifibrotic effect of UA is partially due to its oxidative stress attenuating effect through manipulation of NADPH oxidase 4 activity and expression. This result suggests that UA may be a promising antifibrotic agent. | He et al., 2015 |

| manner.                                                                    |                                 |
| UA and oleanolic acid extracted from wild loquat leaves can significantly     | Yuan et al., 2015                |
| inhibit the viability of A549 cells (human lung adenocarcinoma epithelial cell|                                 |
| line).                                                                     |                                 |
| The beneficial effects of UA on nonalcoholic fatty liver disease (NAFLD) may  | Li et al., 2015                  |
| be due to its ability to increase lipid heoxidation and to inhibit hepatic    |                                 |
| endoplasmic reticulum stress. Together, UA may be further considered as a    |                                 |
| natural compound for NAFLD treatment.                                        |                                 |
| UA ameliorated the symptoms of experimental autoimmune myasthenia gravis     | Xu et al., 2015                  |
| (EAMG), a rat model of MG. These findings suggest a new strategy to treat    |                                 |
| EAMG and even human MG.                                                     |                                 |
| UA and its novel prodrug derivative US597 modulate expression of cell        | Xiang et al., 2015              |
| adhesion molecules within the focal adhesion signaling pathway, leading to    |                                 |
| cancer cell motility.                                                       |                                 |
| UA protects against wear particle-induced osteolysis by suppressing osteo-   | Jiang et al., 2015              |
| clast formation and function.                                               |                                 |
| Folic acid-modified dendrimeric UA prodrugs have the potential for targeted  | Gao et al., 2015                 |
| delivery of UA into cancer cells to improve its anti-tumor efficacy.         |                                 |
| UA induces apoptosis and inhibits the invasive phenotype of gastric cancer    | Kim and Moon, 2015              |
| cells; therefore, it may have potential application as a chemopreventive      |                                 |
| agent to prevent the metastasis of gastric cancer or to alleviate metastasis. |                                 |
| A potential novel mechanism by which UA controls the growth of hepatocellular| Yie et al., 2015                 |
| carcinoma (HCC) cells and suggests that DNA methyltransferase 1 could be a   |                                 |
| novel target for HCC chemoprevention and treatment.                         |                                 |
Table 1 (cont.): Recent studies on ursolic acid and its biological and pharmacological activities

| Key message                                                                 | Reference                      |
|------------------------------------------------------------------------------|--------------------------------|
| The combination of UA and leucine promotes muscle cell differentiation, thus suggesting that this combination of agents may prove to be beneficial in increasing muscle mass. | Kim et al., 2015               |
| UA-induced mitochondrial reactive oxygen species (ROS) production can elicit mitochondrial uncoupling and glutathione-dependent antioxidant responses, which offer cytotoxic protection against oxidant injury in H9c2 cells. | Chen et al., 2015              |
| UA significantly prevented carbon tetrachloride-induced hepatotoxicity and fibrosis, indicated by both diagnostic indicators and histopathological analysis. | Ma et al., 2015                |
| UA exerts protective effects in cecal ligation and puncture-induced septic rats, and may be a potential therapeutic agent against sepsis. | Hu et al., 2015                |
| UA ameliorates lipid and glucose metabolism in high-fat diet-fed mice, primarily by the activation of peroxisome proliferation-activated receptor-α and induction of the hepatic autophagy pathway. Thus, intake of UA in the diet or in an isolated form may ameliorate lipid and glucose metabolism. | Jia et al., 2015               |
| UA activated the phagocytosis of human monocytes through MRP8 induction. These data suggest that UA firmly contributes to the intracellular killing effect of macrophages during mycobacterial infection. | Podder et al., 2015            |
| UA may attenuate early brain injury after subarachnoid hemorrhage in rats by suppressing the toll-like receptor 4-mediated inflammatory pathway. | Zhang et al., 2014             |
| UA and xylitol, synergistic inhibitors, could be potential agents for enhancing the antimicrobial and anti-biofilm efficacy against *S. mutans* and *S. sobrinus* in the oral environment. | Zou et al., 2014               |
| UA exhibits significant anti-tumor effects by suppressing cell proliferation, promoting apoptosis, and inducing cell cycle arrest both in vitro and in vivo. It may be a potential agent for treating gallbladder cancer. | Weng et al., 2014              |
| In vitro, in silico, and in vivo results indicate that UA is a promising, inexpensive, widely available natural lead, which can be designed and developed into a macrofilaricidal drug. This is the first ever report on the anti-filarial potential of UA from *E. tereticornis*. | Kalani et al., 2014            |
| UA, a bioactive natural compound, inhibits superoxide anion generation and elastase release in human neutrophils and ameliorates trauma- and hemorrhagic shock-induced organ injury in rats. | Hwang et al., 2014             |
| UA-induced elevation of serum irisin may be useful as a strategy for the enhancement of skeletal muscle strength during resistance training in men. | Bang et al., 2014              |
| UA stimulates glucose uptake in 3T3-L1 adipocytes through the PI3K pathway, providing important information regarding the anti-diabetic mechanism of action of UA. | He et al., 2014                |
| The antihyperglycemic role of UA is mediated through insulin secretion and insulino mimetic effect on glucose uptake, synthesis, and translocation of GLUT4 by a mechanism of cross-talk between calcium and protein kinases. UA is a potential anti-diabetic agent with pharmacological properties for insulin resistance and diabetes therapy. | Castro et al., 2015            |
| UA can increase serum S100 protein expression and promote neural regeneration in BALB/c mice following sciatic nerve injury, in a dose-dependent manner. | Liu et al., 2013               |
**Table 1 (cont.):** Recent studies on ursolic acid and its biological and pharmacological activities

| Key message                                                                 | Reference          |
|-----------------------------------------------------------------------------|--------------------|
| Combination treatment with UA and rosiglitazone down-regulated lipogenic    | Sundaresan et al., |
| genes and upregulated fatty acid oxidative genes in high-fat diet-fed mice. | 2014               |
| This study suggests that UA in combination with rosiglitazone reduced lipid  |                    |
| accumulation in liver.                                                       |                    |
| UA treatment significantly ameliorates collagen-induced arthritis in mice via | Baek et al., 2014   |
| suppression of Th17 and differentiation. By targeting pathogenic Th17 cells   |                    |
| and autoantibody production, UA may be useful for the treatment of autoimmune |                    |
| arthritis and other Th17-related diseases.                                   |                    |
| Low-dose UA had preventive potency for diabetic renal complications, which   | Lee et al., 2014    |
| could be mediated by changes in hepatic glucose metabolism and the renal      |                    |
| polyol pathway. High-dose UA was more effective anti-dyslipidemia therapy in  |                    |
| non-obese type 2 diabetic mice.                                              |                    |
| UA exerts its antifilarial effect through induction of apoptosis and by        | Saini et al., 2014  |
| downregulating and altering the level of some key antioxidants such as GSH,   |                    |
| GST, and SOD of *Setaria cervi*.                                             |                    |
| UA inhibits nuclear factor-kappa B activation in both intestinal epithelial   | Chun et al., 2014   |
| cells and macrophages, and attenuates experimental murine colitis. These      |                    |
| results suggest that UA is a potential therapeutic agent for inflammatory     |                    |
| bowel disease.                                                               |                    |
| UA could be useful as an adjunct therapy for the treatment of infections      | Ou et al., 2014     |
| involving methicillin-resistant *Staphylococcus aureus* biofilms.            |                    |
| The apoptotic mechanism of UA treatment in HeLa cells involved the           | Li et al., 2014     |
| mitochondrial intrinsic pathway and was closely associated with the            |                    |
| suppression of the ERK1/2 signaling pathway.                                 |                    |
| The inhibition of carbon tetrachloride-induced inflammation by UA is due at  | Ma et al., 2014     |
| least in part to its antioxidant activity and its ability to modulate the S   |                    |
| phosphorylation of transcription 3 (TAT3) and nuclear factor-kappa B signaling |
| pathways.                                                                   |                    |
| UA as a direct negative regulator of the mechanistic target of rapamycin      | Qu et al., 2013     |
| complex 1 signaling pathway and this suggests a novel mechanism by which UA   |                    |
| exerts its beneficial function.                                              |                    |
| H₂O₂ causes the malignant transformation of WB-F344 cells. UA exerts anti-    | Han et al., 2014    |
| tumor effects by inhibiting the proliferation in malignantly transformed WB-  |                    |
| F344 cells.                                                                  |                    |
| UA exerts anticancer activity against colon cancer cells by promoting the   | Kim et al., 2014    |
| N-terminal phosphorylation and subsequent proteasomal degradation of ainst   |                    |
| colo.                                                                        |                    |
| UA could induce the differentiation of the human leukemia cell line U937 by   | Deng et al., 2014   |
| activating the PI3K/Akt pathway, and it could be a potential candidate as a   |                    |
| differentiation-inducing agent for leukemia therapy.                         |                    |
| UA treatment exhibited a protective effect on kidneys in diabetic rats, implying | Ling et al., 2013   |
| that it could be a potential treatment for diabetic nephropathy.              |                    |
| UA and its derivatives were examined for their radical scavenging activity by | do Nascimento et   |
| using the DPPH assay, and showed significant antioxidant activity.            | al., 2014          |
Table 1 (cont.): Recent studies on ursolic acid and its biological and pharmacological activities

| Key message                                                                                           | Reference                           |
|-------------------------------------------------------------------------------------------------------|-------------------------------------|
| Signal transducer and activator of transcription 3 (STAT3) is a target for colon cancer prevention. UA, a dietary agent, might offer an effective approach for colorectal carcinoma prevention by inhibiting the persistently activated STAT3 in cancer stem cells. | Wang et al., 2013                   |
| UA induces the activation of p53, NF-κB, and Bax, leading to the enhancement of p21 transcriptional activity and activation of caspase-9 and -3, thus finally inducing apoptosis of human colon adenocarcinoma cells, SW480 cells. | Nam and Kim et al., 2013             |
| The inhibition of tumor angiogenesis via suppression of multiple signaling pathways might be one of the mechanisms whereby UA can be effective in cancer treatment. | Lin et al., 2013                     |
| UA nanocrystals may be used as a potential delivery formulation for intravenous injection with enhanced dissolution velocity and anticancer activity. | Song et al., 2014                    |
| UA inhibits the growth of cariogenic microorganisms, which suggests that it has considerable potential as an antibacterial agent for dental caries prevention. | Zhou et al., 2013                    |
