Supplement of

Black carbon aerosol reductions during COVID-19 confinement quantified by aircraft measurements over Europe

Supplementary text

S1 Boundary layer and terrain height below flight track

To provide the planetary boundary layer height below the flight track in figures 6 and A1 we used the HYSPLIT package (Rolph et al., 2017; Stein et al., 2015, version 4, Revision 664, October 2014). We started a new backward trajectory every 60 seconds from the location and altitude of HALO.

The terrain height below the HALO flight track was computed with the online tool GPS visualizer based on the 1 second resolution coordinates of the HALO aircraft (https://www.gpsvisualizer.com/elevation, last access 20.02.2022).

To provide the arithmetic mean of planetary boundary layer and terrain height below the flight track shown in figures 6 and A1 we binned the data along the latitude in 0.2° steps. Then we calculated the arithmetic mean for each of these bins.

S2 EUROSTAT data for fossil and solid fuels

Data published by EUROSTAT is used to investigate the reductions in fossil fuel demand during the confinement period in 2020 (https://ec.europa.eu/eurostat/databrowser/view/NRG_JODL_custom_482779/default/table last access 25.01.2021). We use for figures S3, S2, S1, S4 the terminology suggested by EUROSTAT. However, to make these rather technical terms more clear we refer in section 4 to gasoline for motor spirits and aircraft fuel for kerosene. Furthermore, the difference in solid fossil fuel (which is the compilation of hard coal including: anthracite, coking coal and other bituminous coal; brown coal including: sub-bituminous coal and lignite and coal products including: patent fuel, coke oven coke, gas coke, coal tar and brown coal briquettes https://ec.europa.eu/eurostat/statistics-explained/index.php?oldid=449721, last access 19.04.2022) demand between 2017 and 2020 is used to analyze important drivers for the BC reduction, other than the COVID-19 confinements in 2020 (https://ec.europa.eu/eurostat/databrowser/view/NRG_CB_SFF_custom_1131819/default/table?lang=en last access 08.07.2021 and https://ec.europa.eu/eurostat/databrowser/view/NRG_CB_SFFM_custom_1558586/default/table?lang=en last access 12.11.2021).
Supplementary tables
Table S1. Average and median $M_{BC}$ from HALO observations and EMAC simulations. Values in column altitude represent centre of corresponding 500 m altitude bin.

| Altitude [m] | Observations |     | EMAC | Observations |     | EMAC | EMAC 40 % reduced |
