First record of the genus *Cratolestes* Hull, 1962 (Diptera: Asilidae: Asilinae) from Peru

**Abstract**

Robber flies of the Neotropical genus *Cratolestes* Hull, 1962 are herein recorded for the first time from Peru. The two known species of this genus, *Cratolestes chiliensis* (Macquart, 1850) and *Cratolestes wirithi* Artigas, 1970, so far only recorded from Chile, are reported based on specimens deposited in the entomological collection of the Natural History Museum, Universidad Nacional Mayor de San Marcos, Lima, Peru (MUSM). A distribution map including the new Peruvian records is also presented.

**Keywords:** Distribution; robber flies; Neotropical; diversity; taxonomy.

---

Introduction

Adult robber flies (Asilidae) are opportunistic predators of other arthropods, and, as such, play an important role in natural ecosystems and crops, where they can also be regarded as indicators of good environmental health (Fisher 2009, Londt & Dikow 2017). However, like most groups of Diptera, robber flies are largely understudied in Neotropical countries, where taxonomic and distribution studies are needed for a better understanding of the diversity of this family, known to contain many undescribed species (Fisher 1985, Lamas 1972, Vieira et al. 2019).

Currently, Asilidae is classified into 14 subfamilies (Dikow 2009, Londt & Dikow 2017), with Asilinae Latreille, 1802 being one of the most diverse subfamilies, including 183 extant genera, and present in all biogeographic regions, except Antarctica (Geller-Grimm 2004, Dikow 2010, Camargo et al. 2019). In the Neotropical region, Asilinae includes 68 genera; 15 of which have been recorded from Peru, comprising at least 45 species, as *Eraxasilus* Carrera, 1959 and *Lecania* Ma-
Cratolestes Hull, 1962 is a Neotropical genus of robber flies within the subfamily Asilinae, in an unplaced tribe (Dikow 2021). This genus is only recorded from Chile (Antofagasta, Coquimbo, Tarapacá). Ref. Artigas, 1970; Papavero, 2009.

New record. - Peru (Ayacucho, Ica, Lima, Moquegua).

Material examined. - PERÚ: AV. Lucanas Huac-Huas 10-11.xi.2021 14°4′26.64″S, 75°1′18.53″W 1606 m Manual L. Ramírez (1 ♂, 1 ♀); PERÚ: IC. Santiago, Dique Chapi 14′11″11.8″S, 75′38″05.8″W 437 m 27.vii.2016 E. Sánchez (1 ♂); PERÚ: Dpto. Lima: Yangas (1,000 mt.) 16.iii.85 Daniel Hocking (1 ♂); PERÚ: Dpto. Lima: Mala (Panamericana) 9.iii.85 Pedro Hocking (1 ♂); PERÚ: Dpto. Lima: [San Jerónimo de] Surco (1,800 mt.) 2.vi.84 Pedro Hocking (1 ♂); PERÚ: Dpto. Lima: Laguna Chavína 19.iii.88 Pedro Hocking (1 ♂); PERÚ: Dpto. Lima: Mala (Panamericana) 9.iii.85 Pedro Hocking (1 ♂); PERÚ: Lima, Canta Prov. E. of Chectas 1092m 11.67798°S, 76.79868°W 10.vii.2009 Packer/Rivera (1 ♂); PERÚ: MO [Moquegua] Bocatoma Torata 13.vii.2013 17°7′48.79″S, 70°55′18.53″W 2199m L. Huerto (1 ♂).

Comments. - The characteristic male terminalia of C. chiliensis facilitates its identification and separation from C. wirthi, in the first one the epandrium has two deep indentations (see fig. 227 in Artigas, 1970). In contrast, identifying females is more difficult, however, as explained by Artigas, the presence of spines in the ovipositor of C. chiliensis allows its identification; this feature is absent in C. wirthi.
The predator-prey database for the family Asilidae (Lavigne 2016) shows a record for *C. chiliensis* preying on *Apis mellifera ligustica* Spinola. In Figure 2C a female of *C. wirthi* is preying on a sand wasp (Crabronidae) representing a second predator-prey record for this genus and showing the already established predominance of hymenopterans as preys of robber flies (Dennis & Lavigne 2007).

**Discussion**

*Cratolestes* has been placed in the *Efferia*-group, according to the artificial classification of Asilinae proposed by Artigas and Papavero (1997a, b). However, Fisher (2009) considers that many of the genera proposed for this group are synonyms of *Efferia* Coquillett, 1893 since the unique structure of both male and female genitalia is the best character for recognizing a monophyletic *Efferia*. Accordingly, the genitalic structures in *Cratolestes* are morphologically different to those that are recognized for *Efferia*. Furthermore, Vieira (2013) showed, based on a cladistic analysis, that *Cratolestes* is closer to such genera as *Proctacanthus* Macquart, 1838 or *Lochmorhynchus* Engel, 1930. This highlights the need for a tribal classification of Asilinae, because several genera are currently unplaced at this rank.

The Chilean robberfly fauna is regarded as distinct from other regions in South America due to ecological barriers as the Atacama Desert (Artigas 1970). However, in contrast to Peru, the Chilean diversity of robber flies is well documented, so the distribution of *Cratolestes* species found in arid and semi-arid ecosystems, from central Chile, through the coastal deserts of Peru and Chile, to high altitude localities in the Andean Puna (Fig. 3), suggest that part of the fauna only known in Chile possibly extends its distribution to Peruvian localities.

This work increases to 16 the number of Asilinae genera that are recorded from Peru. However, MUSM collections show that at least 17 genera occur in this country, with at least two undescribed species of *Threnia* Schiner, 1866 which, like *Eraxasilus* Carrera and *Lecania* Macquart need to be revised to clarify and document their diversity and distribution.

Agradecimientos / Acknowledgments:
Thanks to my colleagues at MUSM for their aid in increasing the material of Asilidae available for my research. I also thank the reviewers for their valuable comments that highly improved this manuscript, and Arthur Anker, who kindly allowed the use of his images of Cratolestes whirti.
