Abstract

Main result of this paper is to derive the exact analytical expressions of information and covariance matrices for multivariate Burr III and logistic distributions. These distributions arise as tractable parametric models in price and income distributions, reliability, economics, populations growth and survival data. We showed that all the calculations can be obtained from one main moment multi dimensional integral whose expression is obtained through some particular change of variables. Indeed, we consider that this calculus technique for improper integral has its own importance in applied probability calculus.

1. Introduction

In this paper the exact form of Fisher information matrices for multivariate Burr III and logistic distributions is determined. It is well-known that the information matrix is a valuable tool for derivation of covariance matrix in the asymptotic distribution of maximum likelihood estimations (MLE). In the univariate case for Pareto (IV) and Burr XII distributions, the Fisher information matrix expressions are given by Brazauskas [4] and Watkins [12]. As discussed in Serfling [11], under suitable regularity conditions, the determinant of the asymptotic covariance matrix of (MLE) reaches an optimal lower bound for the volume of the spread ellipsoid of joint estimators.

The univariate logistic distribution has been studied rather extensively and, in fact, many of its developments through the years were motivated to the normal distribution (see for example the handbook of Balakrishnan [3]). However, work on multivariate logistic distribution has been rather skimpy compared to the voluminous work that has been carried out on bivariate and multivariate normal distributions (Gumbel [8], Arnold [2], Johnson, Kotz and Balakrishnan [9] and Malik and Abraham [10]). For a broad discussion of logistic models and diverse applications see Malik and Abraham [10].

Burr III and Logistic distributions also arise as tractable parametric models in the context of actuarial science, reliability, economics, price and income distributions (Dagum [7], Burr [5] and Burr [6]).

This paper is organized as follows: Multivariate Burr III and logistic distribution are introduced and presented in section 2. Elements of the information and covariance matrix for multivariate Burr III distribution is derived in section 3. Elements of the information and covariance matrix for multivariate logistic distribution is derived in section 4. Conclusion is presented in section 5. Derivation of first and second derivatives of the log–density function of multivariate Burr III distribution and calculation of its main moment integral are given in Appendices A and B. Derivation of first and second derivatives of the log density of multivariate logistic distribution and calculation of its main moment integral are given in Appendices C and D.
2. Multivariate Burr III and logistic distributions

The density function of the Burr III distribution is

\[ f_X(x) = \frac{\alpha c}{\theta (1 + (\frac{x - \mu}{\theta})^{-c})^{\alpha+1}}, \quad x > \mu, \]  

(1)

where \(-\infty < \mu < +\infty\) is the location parameter, \(\theta > 0\) is the scale parameter, \(c > 0\) is the shape parameter and \(\alpha > 0\) is the shape parameter which characterizes the tail of the distribution.

The \(n\)-dimensional Burr III distribution is

\[ f_n(x) = \left(1 + \sum_{j=1}^{n} (\frac{x_j - \mu_j}{\theta_j})^{-c_j}\right)^{-(\alpha+n)} \prod_{i=1}^{n} \frac{(\alpha + i - 1)c_i}{\theta_i} \left(\frac{x_i - \mu_i}{\theta_i}\right)^{-(c_i+1)}, \]  

(2)

where \(x = [x_1, \cdots, x_n]\), \(x_i > \mu_i, c_i > 0, -\infty < \mu_i < +\infty, \alpha > 0, \theta_i > 0\) for \(i = 1, \cdots, n\). One of the main properties of this distribution is that, the joint density of any subset of the components of a multivariate Burr III random vector is again of the form \([9]\).

The density of the logistic distribution is

\[ f_X(x) = \frac{\alpha}{\theta} e^{-\frac{x - \mu}{\theta}} \left(1 + e^{-\frac{x - \mu}{\theta}}\right)^{-(\alpha+1)}, \quad x > \mu, \]  

(3)

where \(-\infty < \mu < +\infty\) is the location parameter, \(\theta > 0\) is the scale parameter and \(\alpha > 0\) is the shape parameter.

The \(n\)-dimensional logistic distribution is

\[ f_n(x) = \left(1 + \sum_{j=1}^{n} e^{-\frac{x_j - \mu_j}{\theta_j}}\right)^{-(\alpha+n)} \prod_{i=1}^{n} \frac{(\alpha + i - 1)}{\theta_i} e^{-\left(\frac{x_i - \mu_i}{\theta_i}\right)}, \]  

(4)

where \(x = [x_1, \cdots, x_n]\), \(x_i > \mu_i, \alpha > 0, -\infty < \mu_i < +\infty\) and \(\theta_i > 0\) for \(i = 1, \cdots, n\). The joint density of any subset of the components of a multivariate logistic random vector is again of the form \([9]\).

3. Information Matrix for Multivariate Burr III

Suppose \(X\) is a random vector with the probability density function \(f_{\Theta}(x)\) where \(\Theta = (\theta_1, \theta_2, \ldots, \theta_K)\). The information matrix \(I(\Theta)\) is the \(K \times K\) matrix with elements

\[ I_{ij}(\Theta) = -E \left[ \frac{\partial^2 \ln f_{\Theta}(X)}{\partial \theta_i \partial \theta_j} \right], \quad i, j = 1, \cdots, K. \]  

(5)
For the multivariate Burr III, we have $\Theta = (\mu_1, \cdots, \mu_n, \theta_1, \cdots, \theta_n, c_1, \cdots, c_n, \alpha)$. In order to make the multivariate Burr III distribution a regular family (in terms of maximum likelihood estimation), we assume that vector $\mu$ is known and, without loss of generality, equal to 0. In this case information matrix is $(2n + 1) \times (2n + 1)$. Thus, further treatment is based on the following multivariate density function

$$f_n(x) = \left(1 + \sum_{j=1}^{n} \left(\frac{x_j}{\theta_j}\right)^{-c_j}\right)^{-(\alpha+n)} \prod_{i=1}^{n} \left(\frac{\alpha + i - 1}{\theta_i}\right)^{-c_i} \left(\frac{x_i}{\theta_i}\right)^{-\alpha}, \quad x_i > 0. \quad (6)$$

The log-density function is:

$$\ln f_n(x) = \sum_{i=1}^{n} \left[\ln(\alpha + i - 1) - \ln \theta_i + \ln c_i\right] - (c_i + 1) \ln \left(\frac{x_i}{\theta_i}\right) - (\alpha + n) \ln \left(1 + \sum_{j=1}^{n} \left(\frac{x_j}{\theta_j}\right)^{-c_j}\right). \quad (7)$$

Since the information matrix $I(\Theta)$ is symmetric, it is enough to find elements $I_{ij}(\Theta)$, where $1 \leq i \leq j \leq 2n + 1$. The first and second partial derivatives of the above expression are given in the Appendix A. In order to determine the information matrix and score functions, we need to find expressions of the generic terms such as

$$E \left[\ln \left(1 + \sum_{j=1}^{n} \left(\frac{X_j}{\theta_j}\right)^{-c_j}\right)\right] \quad \text{and} \quad E \left[\left(\frac{X_l}{\theta_l}\right)^{-c_l} \left(\frac{X_k}{\theta_k}\right)^{-c_k}\right]$$

and evaluation of the required orders partial derivatives of the last expectation at the required points.

### 3.1. Main strategy to obtain expressions of the expectations

Derivation of these expressions are based on the following strategy: first, we derive an analytical expression for the following integral

$$E \left[\prod_{i=1}^{n} \left(\frac{X_i}{\theta_i}\right)^{r_i}\right] = \int_{0}^{+\infty} \cdots \int_{0}^{+\infty} \prod_{i=1}^{n} \left(\frac{x_i}{\theta_i}\right)^{r_i} f_n(x) \, dx, \quad (8)$$

and then, we show that all the other expressions can easily be found from it. We consider this derivation as one of the main contributions of this work. This derivation
is given in the Appendix B. The result is the following:

\[
E \left[ \prod_{i=1}^{n} \left( \frac{X_i}{\theta_i} \right)^{r_i} \right] = \int_{0}^{+\infty} \cdots \int_{0}^{+\infty} \prod_{i=1}^{n} \left( \frac{x_i}{\theta_i} \right)^{r_i} f_n(x) \, dx
\]

\[
= \frac{\Gamma(\alpha + \sum_{i=1}^{n} \frac{r_i}{c_i}) \prod_{i=1}^{n} \Gamma(1 - \frac{r_i}{c_i})}{\Gamma(\alpha)} = \sum_{i=1}^{n} \frac{r_i}{c_i} < \alpha, \quad \frac{r_i}{c_i} < 1,
\]

where \( \Gamma \) is the usual Gamma function and

\[
\Gamma_{r_1r_k} \left( \alpha + \sum_{i=1}^{n} \frac{r_i}{c_i} \right) = \frac{\partial^2 \Gamma(\alpha + \sum_{i=1}^{n} \frac{r_i}{c_i})}{\partial r_k \partial r_l}, \quad 1 \leq l, k \leq n,
\]

\[
\Psi^{(n)}(z) = \frac{d^n}{dz^n} \left( \frac{\Gamma'(z)}{\Gamma(z)} \right), \quad z > 0,
\]

\[
\frac{\partial^{(m+n)}}{\partial r_l^m \partial r_k^n} \left( \frac{\Gamma_{r_1r_k}(z)}{\Gamma(z)} \right) = \Psi^{(m+n)}(z), \quad z > 0
\]

and \( n, m \in \mathbb{N} \).

Specifically, we use digamma \( \Psi(z) = \Psi^{(1)}(z) \), trigamma \( \Psi'(z) \) and \( \Psi_{r_1r_k}(z) \) functions (Abramowitz [1] and Brazauskas [4]). To confirm the regularity of \( \ln f_n(x) \) and evaluation of the expected Fisher information matrix, we take expectations of the first and second order partial derivatives of \( \ln f_n(x) \). All the other expressions can be derived from this main result. Derivative with respect to \( \alpha \), from the both sides of the relation

\[
1 = \int_{0}^{+\infty} f_n(x) \, dx,
\]

leads to

\[
E \left[ \ln \left( 1 + \sum_{j=1}^{n} \left( \frac{X_i}{\theta_j} \right)^{-c_j} \right) \right] = \sum_{i=1}^{n} \frac{1}{\alpha + i - 1}.
\]

From relation (9), for a pair of \((l,k)\) we have

\[
\varphi(r_l, r_k) = E \left[ \left( \frac{X_l}{\theta_l} \right)^{r_l} \left( \frac{X_k}{\theta_k} \right)^{r_k} \right] = \frac{\Gamma(\alpha + \frac{r_l}{c_l} + \frac{r_k}{c_k}) \Gamma(\frac{-r_l}{c_l} + 1) \Gamma(\frac{-r_k}{c_k} + 1)}{\Gamma(\alpha)}.
\]

From relation (12), at \( r_k = 0 \) we obtain

\[
\xi(r_l) = E \left[ \left( \frac{X_l}{\theta_l} \right)^{r_l} \right] = \frac{\Gamma(\alpha + \frac{r_l}{c_l}) \Gamma(\frac{-r_l}{c_l} + 1)}{\Gamma(\alpha)}.
\]
Evaluating this expectation at \( r_l = -c_l, r_t = -2c_l \) and the relation \((12)\) at \( (r_l = -c_l, r_k = -c_k)\), we obtain

\[ E \left[ \frac{X_l}{\theta_l} \right]^{-c_l} = \frac{1}{\alpha - 1}, \]
\[ E \left[ \frac{X_l}{\theta_l} \right]^{-2c_l} = \frac{2}{(\alpha - 1)(\alpha - 2)}, \]
\[ E \left[ \frac{X_l}{\theta_l} \right]^{-c_l} \frac{X_k}{\theta_k}^{-c_k} = \frac{1}{(\alpha - 1)(\alpha - 2)}. \]

Evaluating the required orders partial derivatives of \((13)\) and \((12)\) at the required points, we have

\[ E \left[ \ln \left( \frac{X_l}{\theta_l} \right) \right] = \frac{[\Psi(\alpha) - \Gamma'(1)]}{c_l}, \]
\[ E \left[ \ln \left( \frac{X_l}{\theta_l} \right) \right] = \frac{[\Psi(\alpha - 1) - \Gamma'(2)]}{c_l(\alpha - 1)}, \]
\[ E \left[ \ln^2 \left( \frac{X_l}{\theta_l} \right) \right] = \frac{[\Psi^2(\alpha - 1) + \Psi'(\alpha - 1) - 2\Psi(\alpha - 1)\Gamma'(2) + \Gamma''(2)]}{c_l^2(\alpha - 1)}, \]
\[ E \left[ \ln^2 \left( \frac{X_l}{\theta_l} \right) \right] = \frac{[2\Psi^2(\alpha - 2) + 2\Psi'(\alpha - 2) - 2\Psi(\alpha - 2)\Gamma'(3) + \Gamma''(3)]}{c_l^2(\alpha - 1)(\alpha - 2)}, \]
\[ E \left[ \ln \left( \frac{X_l}{\theta_l} \right) \ln \left( \frac{X_k}{\theta_k} \right) \right] = \frac{[\Psi_{r_l}(\alpha - 2) - \Gamma'(2)]}{c_k(\alpha - 1)(\alpha - 2)}, \]
\[ E \left[ \left( \frac{X_l}{\theta_l} \right)^{-c_l} \left( \frac{X_k}{\theta_k} \right)^{-c_k} \ln \left( \frac{X_l}{\theta_l} \right) \ln \left( \frac{X_k}{\theta_k} \right) \right] = \frac{[\Gamma'(2)(\Psi_{r_l}(\alpha - 2) + \Psi_{r_k}(\alpha - 2)) + (\Gamma'(2))^2 + \Psi_{r_l}(\alpha - 2)\Psi_{r_k}(\alpha - 2)]}{c_l c_k(\alpha - 1)(\alpha - 2)}. \]

From these equations with \( \alpha \) replaced by \( (\alpha + 1) \) and \( (\alpha + 2) \) in \((6)\), we can show that
3.2. Expectations of the score functions

The expectations of the first three derivations of the first order follow immediately from the corresponding results for their three corresponding parameters and we obtain:

\[
E \left[ \frac{\partial \ln f_n(X)}{\partial \alpha} \right] = \frac{1}{\alpha + n} \E_{\alpha+1} \left[ \frac{X_i}{\theta_i} \right]^{\frac{\alpha}{\alpha + n}} = 0,
\]

\[
E \left[ \frac{\partial \ln f_n(X)}{\partial \theta_i} \right] = \frac{c_i}{\theta_i} - \left( \frac{\alpha + n}{\theta_i} \right) E \left[ \frac{X_i}{\theta_i} \right]^{\frac{\alpha}{\alpha + n}} \left( \frac{\alpha + n}{\theta_i} \right) = 0,
\]
\[
E \left[ \frac{\partial \ln f_n(X)}{\partial c_l} \right] = \frac{1}{c_l} - E \left[ \ln \left( \frac{X_l}{\theta_l} \right) \right] + (\alpha + n) E \left[ \frac{\left( \frac{X_l}{\theta_l} \right) - c_l \ln \left( \frac{X_l}{\theta_l} \right)}{1 + \sum_{j=1}^{n} \left( \frac{X_j}{\theta_j} - c_j \right)} \right] = 0.
\]

### 3.3. The expected Fisher information matrix

Main strategy is again based on the integral (9) which is presented in the Appendix B. After some tedious algebraic simplifications, the following expressions can be obtained

\[
I_x(\alpha) = \sum_{i=1}^{n} \frac{1}{(\alpha + i - 1)^2},
\]

\[
I_x(\theta_l, \alpha) = \frac{c_l}{\theta_l (\alpha + n)}, \quad l = 1, \ldots, n,
\]

\[
I_x(c_l, \alpha) = -\frac{1}{c_l (\alpha + n)} [\Psi(\alpha) - \Gamma'(2)], \quad l = 1, \ldots, n,
\]

\[
I_x(\theta_l) = \frac{c_l^2(\alpha + n - 1)}{\theta_l^2(\alpha + n + 1)}, \quad l = 1, \ldots, n,
\]

\[
I_x(c_l) = \frac{1}{c_l^2} \left[ 1 + \Gamma''(2) - 2 \Psi(\alpha) \Gamma'(2) + \Psi^2(\alpha) + \Psi'(\alpha) \right] \quad l = 1, \ldots, n,
\]

\[
- \frac{2}{c_l^2 (\alpha + n + 1)} \left[ \Gamma'(3) \Psi(\alpha) + \Psi^2(\alpha) + \Psi'(\alpha) + \frac{1}{2} \Gamma''(3) \right], \quad l = 1, \ldots, n,
\]

\[
I_x(\theta_l, \theta_k) = \frac{c_l c_k}{\theta_l \theta_k (\alpha + n + 1)}, \quad k \neq l,
\]

\[
I_x(c_l, c_k) = -\frac{\Gamma'(2) \Psi(r_k(\alpha))}{c_l c_k (\alpha + n + 1)}, \quad k \neq l,
\]

\[
I_x(\theta_l, c_k) = \frac{\Gamma'(2) - \Psi(\alpha)}{\theta_l (\alpha + n + 1)} + \frac{2 \Psi(\alpha) - \Gamma'(3)}{\theta_l (\alpha + n + 1)}, \quad l = 1, \ldots, n.
\]

Thus the information matrix, \( I_{\text{Burr III}}(\Theta) \), for the multivariate Burr III(0, \( \theta, c, \alpha \)) distribution is

\[
I_{\text{Burr III}}(\Theta) = \begin{bmatrix}
I(\theta_l, \theta_k) & I(\theta_l, c_k) & I(\theta_l, \alpha) \\
I(\theta_l, c_k) & I(c_l, c_k) & I(c_l, \alpha) \\
I(\theta_l, \alpha) & I(c_l, \alpha) & I(\alpha)
\end{bmatrix}.
\]
3.4. Covariance matrix for multivariate Burr III

Since the joint density of any subset of the components of a multivariate Burr III random vector is again of the form (2) we can calculate the expectation

\[
E \left[ \left( \frac{X_l - \mu_l}{\theta_l} \right)^{m_l} \left( \frac{X_k - \mu_k}{\theta_k} \right)^{m_k} \right] = \int_0^\infty \int_0^\infty \left( \frac{x_l - \mu_l}{\theta_l} \right)^{m_l} \left( \frac{x_k - \mu_k}{\theta_k} \right)^{m_k} f_{X_l,X_k}(x_l, x_k) \, dx_l \, dx_k 
\]

\[
= \frac{\Gamma(\alpha + \frac{m_l}{c_l} + \frac{m_k}{c_k})\Gamma(1 - \frac{m_l}{c_l})\Gamma(1 - \frac{m_k}{c_k})}{\Gamma(\alpha)}, 
\]

\[
1 - \frac{m_l}{c_l} > 0, \quad 1 - \frac{m_k}{c_k} > 0, \quad \alpha + \frac{m_l}{c_l} + \frac{m_k}{c_k} > 0. \tag{15}
\]

Evaluating this expectation at \((m_l = 1, m_k = 0), (m_l = 0, m_k = 1) (m_l = 1, m_k = 1)\) and \((m_l = m, m_k = 0)\) we obtain

\[
E[X_l] = \mu_l + \frac{\theta_l}{\Gamma(\alpha)}[\Gamma(\alpha + \frac{1}{c_l})\Gamma(1 - \frac{1}{c_l})], 
\]

\[
E[X_k] = \mu_k + \frac{\theta_k}{\Gamma(\alpha)}[\Gamma(\alpha + \frac{1}{c_k})\Gamma(1 - \frac{1}{c_k})], 
\]

\[
E[X_l X_k] = \mu_l E[X_l] + \mu_k E[X_k] - \mu_l \mu_k + \frac{\theta_l \theta_k}{\Gamma(\alpha)}[\Gamma(\alpha + \frac{1}{c_l} + \frac{1}{c_k})\Gamma(1 - \frac{1}{c_k})\Gamma(1 - \frac{1}{c_l})], 
\]

\[
E[X_l^m] = \frac{\theta_l^m}{\Gamma(\alpha)}[\Gamma(\alpha + \frac{m}{c_l})\Gamma(1 - \frac{m}{c_l})], 
\]

\[
\text{Var} \{X_l\} = \frac{\theta_l^2}{\Gamma^2(\alpha)} \left[ \Gamma(\alpha + \frac{2}{c_l})\Gamma(1 - \frac{2}{c_l})\Gamma(\alpha) - \Gamma^2(1 - \frac{1}{c_l})\Gamma^2(\alpha + \frac{1}{c_l}) \right], \quad 1 - \frac{2}{c_l} > 0, 
\]

\[
\text{Cov} \{X_l, X_k\} = \frac{\theta_l \theta_k}{\Gamma^2(\alpha)} \left[ \Gamma(1 - \frac{1}{c_l})\Gamma(1 - \frac{1}{c_k})\Gamma(\alpha + \frac{1}{c_l} + \frac{1}{c_k})\Gamma(\alpha) - \Gamma(\alpha + \frac{1}{c_l})\Gamma(\alpha + \frac{1}{c_k}) \right], \quad 1 \leq l < k \leq n, \quad k = 2, \ldots, n. 
\]

4. Information Matrix for Logistic distribution

For the multivariate logistic distribution, we have \(\Theta = (\mu_1, \cdots, \mu_n, \theta_1, \cdots, \theta_n, \alpha)\). In order to make the multivariate logistic distribution a regular family (in terms of maximum likelihood estimation), we assume that vector \(\mu\) is known and, without loss of generality, equal to 0. In this case information matrix is \((n + 1) \times (n + 1)\).
Thus, further treatment is based on the following multivariate density function

\[ f_n(x) = \left(1 + \sum_{j=1}^{n} e^{-\left(\frac{x_j}{\theta_j}\right)}\right)^{-(\alpha+n)} \prod_{i=1}^{n} \frac{\alpha + i - 1}{\theta_i} e^{-\left(\frac{x_i}{\theta_i}\right)}. \]  

Thus, the log-density function is:

\[ \ln f_n(x) = \sum_{i=1}^{n} \left[ \ln(\alpha + i - 1) - \ln \theta_i \right] - \sum_{i=1}^{n} \left(\frac{x_i}{\theta_i}\right) - (\alpha + n) \ln \left(1 + \sum_{j=1}^{n} e^{-\left(\frac{x_j}{\theta_j}\right)}\right). \]  

Since the information matrix \( I(\Theta) \) is symmetric it is enough to find elements \( I_{ij}(\Theta) \), where \( 1 \leq i \leq j \leq n + 1 \). The first and second partial derivatives of the above expression are given in the Appendix C. Looking at these expressions, we see that to determine the expression of the information matrix and score functions, we need to find the following expectations

\[ E\left[ \ln \left(1 + \sum_{j=1}^{n} e^{-\left(\frac{x_j}{\theta_j}\right)}\right) \right] \quad \text{and} \quad E\left[ \left(e^{-\left(\frac{x_l}{\theta_l}\right)}\right)^{r_l} \left(e^{-\left(\frac{x_k}{\theta_k}\right)}\right)^{r_k} \right], \]

and evaluation of the required orders partial derivatives of the last expectation at the required points.

**4.1. Main strategy to obtain expressions of the expectations**

Derivation of these expressions are based on the following strategy: first, we derive an analytical expression for the following integral

\[ E\left[ \prod_{i=1}^{n} \left(e^{-\left(\frac{x_i}{\theta_i}\right)}\right)^{r_i} \right] = \int_{0}^{+\infty} \cdots \int_{0}^{+\infty} \prod_{i=1}^{n} \left(e^{-\left(\frac{x_i}{\theta_i}\right)}\right)^{r_i} f_n(x) \, dx, \]  

and then, we show that all the other expressions can be found from this easily. This derivation is given in the Appendix D. The result is the following:

\[ E\left[ \prod_{i=1}^{n} \left(e^{-\left(\frac{x_i}{\theta_i}\right)}\right)^{r_i} \right] = \frac{\Gamma(\alpha - \sum_{i=1}^{n} r_i) \prod_{i=1}^{n} \Gamma(1 + r_i)}{\Gamma(\alpha)} \left(\sum_{i=1}^{n} r_i < \alpha, \quad r_i > -1. \right) \]
Taking of derivative with respect to $\alpha$, from the both sides of the relation
\[ 1 = \int_0^{+\infty} f_n(x) \, dx, \]  
leads us to
\[ E \left[ \ln \left( 1 + \sum_{j=1}^{n} e^{-\frac{x_j}{\eta_j}} \right) \right] = \sum_{i=1}^{n} \frac{1}{\alpha + i - 1}. \]

From relation (19), for a pair of $(l, k)$ we have
\[ \varphi(r_l, r_k) = E \left[ \left( e^{-\frac{X_l}{\theta_l}} \right)^{r_l} \left( e^{-\frac{X_k}{\theta_k}} \right)^{r_k} \right] = \frac{\Gamma(\alpha - r_l - r_k)\Gamma(r_k + 1)\Gamma(r_l + 1)}{\Gamma(\alpha)}. \]

From relation (22), at $r_k = 0$ we obtain
\[ E \left[ e^{-\frac{X_k}{\theta_k}} \right] = \frac{1}{\alpha - 1}. \]

Differentiating first and second order of (23) with respect to $r_l$ and replacing for $r_l = 0$, $r_l = 1$ and $r_l = 2$, we obtain the following relations:

\begin{align*}
E \left[ \frac{X_l}{\theta_l} \right] &= \Psi(\alpha) - \Gamma'(1), \\
E \left[ \frac{X_l}{\theta_l} \left( e^{-\frac{X_l}{\theta_l}} \right) \right] &= \frac{\Psi(\alpha - 1) - \Gamma'(2)}{\alpha - 1}, \\
E \left[ \frac{X_l^2}{\theta_l} \left( e^{-\frac{X_l}{\theta_l}} \right) \right] &= \frac{\Psi^2(\alpha - 1) - 2\Gamma'(2)\Psi(\alpha - 1) + \Psi'(\alpha - 1) + \Gamma''(2)}{(\alpha - 1)}, \\
E \left[ \frac{X_l^2}{\theta_l} e^{-2\frac{X_l}{\theta_l}} \right] &= \frac{\Gamma''(3) - 2\Gamma'(3)\Psi(\alpha - 2) + 2\Psi^2(\alpha - 2) + 2\Psi'(\alpha - 2)}{(\alpha - 1)(\alpha - 2)}.
\end{align*}

From relation (25),
\[ \frac{\partial}{\partial r_l \partial r_k} \varphi(r_l = 1, r_k = 1) = E \left[ \frac{X_l}{\theta_l} \left( \frac{X_k}{\theta_k} \right) \left( e^{-\frac{X_l}{\theta_l}} \right) \left( e^{-\frac{X_k}{\theta_k}} \right) \right] = \frac{\Psi_{r_l r_k}(\alpha - 2)}{(\alpha - 1)(\alpha - 2)}. \]

With $\alpha$ replaced by $(\alpha + 1)$ and $(\alpha + 2)$ in (19), we obtain
4.2. Expectations of the score functions

The expectations of the first two derivations of the first order follow immediately from the corresponding results for their two corresponding parameters and we obtain:

$$E \left[ \frac{\partial \ln f_n(X)}{\partial \alpha} \right] = \frac{1}{\alpha + i - 1} - \frac{1}{\alpha + i - 1} \ln \left( 1 + \sum_{j=1}^{n} e^{-\frac{X_j}{\eta}} \right) = 0,$$

$$E \left[ \frac{\partial \ln f_n(X)}{\partial \theta_l} \right] = -\frac{1}{\theta_l} + \frac{1}{\theta_l} \ln \left( 1 + \sum_{j=1}^{n} e^{-\frac{X_j}{\eta}} \right) = 0.$$
\[
I_x(\alpha) = \sum_{i=1}^{n} \frac{1}{(\alpha + i - 1)^2},
\]
\[
I_x(\theta_l, \alpha) = \frac{1}{\theta_l(\alpha + n)} [\Psi(\alpha) - \Gamma'(2)], \quad l = 1, \ldots, n,
\]
\[
I_x(\theta_l, \theta_k) = -\left[\frac{\Gamma'(2)[\Gamma'(2) - \Psi_{rk}(\alpha) - \Psi_r(\alpha)] + \Psi_{r_k}(\alpha)}{\theta_l\theta_k(\alpha + n + 1)}\right], \quad k \neq l.
\]

Thus the information matrix, \(I_{ML}(\Theta)\), for the multivariate logistic \((0, \theta, \alpha)\) distribution is
\[
I_{ML}(\Theta) = \begin{pmatrix}
I(\theta_l, \theta_k) & I(\theta_l, \alpha) \\
I(\theta_l, \alpha) & I(\alpha)
\end{pmatrix}.
\] (26)

### 4.4. Covariance matrix for multivariate Logistic

Since the joint density of any subset of the components of a multivariate logistic
random vector is again multivariate logistic distribution, we can use the relation
\[\frac{\partial^2}{\partial r_l \partial r_k} \varphi(r_l = 0, r_k = 0)\] and obtain
\[
E[X_l X_k] = \theta_l \theta_k \left[\left(\Gamma'(1)\right)^2 - \Gamma'(1) (\Psi_{rk}(\alpha) - \Psi_r(\alpha)) + \Psi_{r_k}(\alpha)\right], \quad k \neq l,
\]
\[
E[X_l] = \theta_l [\Psi(\alpha) - \Gamma'(1)], \quad l = 1, \ldots, n,
\]
\[
E[X_k] = \theta_k [\Psi(\alpha) - \Gamma'(1)], \quad k = 1, \ldots, n.
\]

From second order derivative of relation \[\frac{\partial^2}{\partial r_l \partial r_k} \varphi(r_l = 0, r_k = 0)\] we have
\[
E[X_l^2] = \theta_l^2 \left[\left(\Gamma''(1)\right)^2 - 2 \Gamma'(1) \Psi(\alpha) + 2 \Psi(\alpha) + \Psi'(\alpha)\right], \quad l = 1, \ldots, n,
\]
\[
\text{Cov}[X_l, X_k] = \theta_l \theta_k \left[-\Gamma'(1) (\Psi_{rk}(\alpha) + \Psi_{r_k}(\alpha) - 2 \Psi(\alpha)) + \Psi_{r_k}(\alpha) - \Psi^2(\alpha)\right], \quad k \neq l,
\]
\[
\text{Var}[X_l] = \theta_l^2 \left[\Gamma''(1) - (\Gamma'(1))^2 + \Psi'(\alpha)\right], \quad l = 1, \ldots, n.
\]

### 5. Conclusion

In this paper we obtained the exact forms of Fisher information and covariance
matrices for multivariate Burr III and multivariate logistic distributions. We showed
that in both distributions, all of the expectations can be obtained from two main moment multi dimensional integrals which have been considered and whose expression is obtained through some particular change of variables. A short method of obtaining some of the expectations as a function of $\alpha$ is used. To confirm the regularity of the multivariate densities, we showed that the expectations of the score functions are equal to 0.

**Appendix A. Expressions of the derivatives**

In this Appendix, we give in detail, the expressions for the first and second derivatives of $\ln f_n(x)$, where, $f_n(x)$ is the multivariate Burr III density function, which are needed for obtaining the expression of the information matrix:

\[
\frac{\partial \ln f_n(x)}{\partial \alpha} = \sum_{i=1}^{n} \frac{1}{\alpha + i - 1} - \ln \left( 1 + \sum_{j=1}^{n} \left( \frac{x_j}{\theta_j} \right)^{-c_j} \right),
\]

\[
\frac{\partial \ln f_n(x)}{\partial \theta_l} = \frac{c_l}{\theta_l} \left( \frac{\theta_l}{\theta_l} \right) \left( 1 + \sum_{j=1}^{n} \left( \frac{x_j}{\theta_j} \right)^{-c_j} \right), \quad l = 1, \ldots, n,
\]

\[
\frac{\partial \ln f_n(x)}{\partial c_l} = \frac{1}{c_l} - \ln \left( \frac{x_l}{\theta_l} \right) + \left( \alpha + n \right) \frac{\left( \frac{x_l}{\theta_l} \right)^{-c_l} \ln \left( \frac{x_l}{\theta_l} \right)}{\left( 1 + \sum_{j=1}^{n} \left( \frac{x_j}{\theta_j} \right)^{-c_j} \right)}, \quad l = 1, \ldots, n,
\]

\[
\frac{\partial^2 \ln f_n(x)}{\partial \theta_l \partial \alpha} = -\frac{c_l}{\theta_l} \left( \frac{\theta_l}{\theta_l} \right) \left( 1 + \sum_{j=1}^{n} \left( \frac{x_j}{\theta_j} \right)^{-c_j} \right), \quad l = 1, \ldots, n,
\]

\[
\frac{\partial^2 \ln f_n(x)}{\partial c_l \partial \alpha} = \frac{\left( \frac{\theta_l}{\theta_l} \right)^{-c_l} \ln \left( \frac{x_l}{\theta_l} \right)}{\left( 1 + \sum_{j=1}^{n} \left( \frac{x_j}{\theta_j} \right)^{-c_j} \right)}, \quad l = 1, \ldots, n,
\]
\[
\begin{align*}
\frac{\partial^2 \ln f_n(x)}{\partial \alpha^2} &= - \sum_{i=1}^{n} \frac{1}{(\alpha + i - 1)^2}, \\
\frac{\partial^2 \ln f_n(x)}{\partial \theta_i^2} &= -c_i \frac{\theta_i^2}{\theta_i} + \frac{(\alpha + n)(1 - c_i) c_i}{\theta_i^4} \left( \frac{\theta_i}{\alpha} \right)^{-c_i} \left( 1 + \sum_{j=1}^{n} \left( \frac{\theta_j}{\alpha} \right)^{-c_j} \right) \\
&\quad + \left( \frac{\alpha + n}{\theta_i} \right)^2 \left( \frac{\theta_i}{\alpha} \right)^{-2c_i} \left( 1 + \sum_{j=1}^{n} \left( \frac{\theta_j}{\alpha} \right)^{-c_j} \right)^2, \quad l = 1, \ldots, n, \\
\frac{\partial^2 \ln f_n(x)}{\partial c_i^2} &= - \frac{1}{c_i^2} - (\alpha + n) \left( \frac{\theta_i}{\alpha} \right)^{-c_i} \ln \left( \frac{\theta_i}{\alpha} \right) + (\alpha + n) \frac{\left( \frac{\theta_i}{\alpha} \right)^{-2c_i} \ln^2 \left( \frac{\theta_i}{\alpha} \right)}{\left( 1 + \sum_{j=1}^{n} \left( \frac{\theta_j}{\alpha} \right)^{-c_j} \right)^2},
\end{align*}
\]

**Appendix B. Expression of the main integral**

This Appendix gives one of the main results of this paper which is the derivation of the expression of the following integral

\[
E \left[ \prod_{i=1}^{n} \left( \frac{X_i}{\theta_i} \right)^{r_i} \right] = \int_{0}^{+\infty} \cdots \int_{0}^{+\infty} \prod_{i=1}^{n} \left( \frac{x_i}{\theta_i} \right)^{r_i} f_n(x) \, dx, \quad (1)
\]
where, \( f_n(x) \) is the multivariate Burr III density function. This derivation is done in the following steps:

First consider the following one dimensional integral:

\[
C_1 = \int_0^{+\infty} \frac{\alpha c_1}{\theta_1} \left( \frac{x_1}{\theta_1} \right)^{r_1} \left( \frac{x_1}{\theta_1} \right)^{-(c_1+1)} \left( 1 + \sum_{j=1}^{n} \left( \frac{x_j}{\theta_j} \right)^{-c_j} \right)^{-(\alpha+n)} \, dx_1
\]

\[
= \int_0^{+\infty} \frac{\alpha c_1}{\theta_1} \left( \frac{x_1}{\theta_1} \right)^{r_1} \left( \frac{x_1}{\theta_1} \right)^{-(c_1+1)} \left( 1 + \sum_{j=2}^{n} \left( \frac{x_j}{\theta_j} \right)^{-c_j} \right) \left( 1 + \frac{x_1^{c_1}}{1 + \sum_{j=2}^{n} \left( \frac{x_j}{\theta_j} \right)^{-c_j}} \right)^{-(\alpha+n)} \, dx_1.
\]

Note that, going from first line to second line is just a factorizing and rewriting the last term of the integrand. After many reflections on the links between Burr families and Gamma and Beta functions, we found that the following change of variable

\[
\left( 1 + \frac{x_1^{c_1}}{1 + \sum_{j=2}^{n} \left( \frac{x_j}{\theta_j} \right)^{-c_j}} \right) = \frac{1}{1-t}, \quad 0 < t < 1, \quad (2)
\]

simplifies this integral and guides us to the following result

\[
C_1 = \frac{\alpha \Gamma(1 - \frac{c_1}{r_1}) \Gamma(\alpha + n - 1 + \frac{c_1}{c_1})}{\Gamma(\alpha + n)} \left( 1 + \sum_{j=2}^{n} \left( \frac{x_j}{\theta_j} \right)^{-c_j} \right)^{-(\alpha+n)-r_1+1} \left( 1 + \sum_{j=1}^{n} \left( \frac{x_j}{\theta_j} \right)^{-c_j} \right)^{-(\alpha+n)}. \quad (3)
\]

Then we consider the following similar expression:

\[
C_2 = \int_0^{+\infty} \frac{c_2\alpha(\alpha+1)\Gamma(1 - \frac{c_1}{r_1})\Gamma(\alpha + n - 1 + \frac{c_1}{c_1})}{\theta_2 \Gamma(\alpha + n)} \left( \frac{x_2}{\theta_2} \right)^{r_2} \left( \frac{x_2}{\theta_2} \right)^{-(c_2+1)} \left( 1 + \sum_{j=2}^{n} \left( \frac{x_j}{\theta_j} \right)^{-c_j} \right)^{-(\alpha+n)-\frac{c_1}{r_1}+1} \, dx_2.
\]

\[
= \int_0^{+\infty} \frac{c_2\alpha(\alpha+1)\Gamma(1 - \frac{c_1}{r_1})\Gamma(\alpha + n - 1 + \frac{c_1}{c_1})}{\theta_2 \Gamma(\alpha + n)} \left( \frac{x_2}{\theta_2} \right)^{r_2} \left( \frac{x_2}{\theta_2} \right)^{-(c_2+1)} \left( 1 + \sum_{j=2}^{n} \left( \frac{x_j}{\theta_j} \right)^{-c_j} \right) \left( 1 + \frac{x_2^{c_2}}{\sum_{j=2}^{n} \left( \frac{x_j}{\theta_j} \right)^{-c_j}} \right)^{-(\alpha+n)-\frac{c_1}{r_1}+1} \, dx_2.
\]
and again using the following change of variable:

\[
\left( 1 + \frac{\left( \frac{x_j}{\theta_j} \right)^{-c_j}}{1 + \sum_{j=3}^{n} \left( \frac{x_j}{\theta_j} \right)^{-c_j}} \right) = \frac{1}{1 - t},
\]

we obtain:

\[
C_2 = \frac{\alpha(\alpha + 1)\Gamma(1 - \frac{c_1}{c_1})\Gamma(1 - \frac{c_2}{c_2})\Gamma(\alpha + n - 2 + \frac{c_1}{c_1} + \frac{c_2}{c_2})}{\Gamma(\alpha + n)} \left( 1 + \sum_{j=3}^{n} \left( \frac{x_j}{\theta_j} \right)^{-c_j} \right)^{-(\alpha + n) - \frac{c_1}{c_1} - \frac{c_2}{c_2} + 2}.
\]

Continuing this method, finally, we obtain the general expression:

\[
C_n = E \left[ \prod_{i=1}^{n} \left( \frac{X_i}{\theta_i} \right)^{r_i} \right] = \frac{\Gamma(\alpha + \sum_{i=1}^{n} \frac{r_i}{c_i}) \prod_{i=1}^{n} \Gamma(1 - \frac{r_i}{c_i})}{\Gamma(\alpha)} \cdot \sum_{i=1}^{n} \frac{r_i}{c_i} < \alpha, \quad 1 - \frac{r_i}{c_i} > 0.
\]

We may note that to simplify the lecture of the paper we did not give all the details of these calculations.

**Appendix C. Expressions of the derivatives**

In this Appendix, we give in detail the expressions for the first and second derivatives of \( \ln f_n(x) \), where, \( f_n(x) \) is the multivariate logistic density function \( (16) \), which are needed for obtaining the expression of the information matrix:
\[
\frac{\partial \ln f_n(x)}{\partial \alpha} = \sum_{i=1}^{n} \frac{1}{\alpha + i - 1} - \ln \left( 1 + \sum_{j=1}^{n} e^{-\left(\frac{x_j}{\theta_j}\right)} \right),
\]

\[
\frac{\partial \ln f_n(x)}{\partial \theta_l} = -\frac{1}{\theta_l} + \frac{x_l}{\theta_l^2} - \frac{(\alpha + n)}{\theta_l} \left( \frac{x_l}{\theta_l} \right) e^{-\left(\frac{x_l}{\theta_l}\right)} \left( 1 + \sum_{j=1}^{n} e^{-\left(\frac{x_j}{\theta_j}\right)} \right), \quad l = 1, \ldots, n,
\]

\[
\frac{\partial^2 \ln f_n(x)}{\partial \alpha^2} = -\sum_{i=1}^{n} \frac{1}{(\alpha + i - 1)^2},
\]

\[
\frac{\partial^2 \ln f_n(x)}{\partial \theta_l \partial \alpha} = -\left( \frac{x_l}{\theta_l} \right) e^{-\left(\frac{x_l}{\theta_l}\right)} \theta_l \left( 1 + \sum_{j=1}^{n} e^{-\left(\frac{x_j}{\theta_j}\right)} \right), \quad l = 1, \ldots, n,
\]

\[
\frac{\partial^2 \ln f_n(x)}{\partial \theta_l \partial \theta_k} = \frac{\alpha + n}{\theta_l \theta_k} \left( \frac{x_l}{\theta_l} \right) e^{-\left(\frac{x_l}{\theta_l}\right)} \left( 1 + \sum_{j=1}^{n} e^{-\left(\frac{x_j}{\theta_j}\right)} \right)^2, \quad k \neq l,
\]

\[
\frac{\partial^2 \ln f_n(x)}{\partial \theta_l^2} = \frac{1}{\theta_l^2} - \frac{2x_l}{\theta_l^3} + \frac{2(\alpha + n)}{\theta_l^2} \left( \frac{x_l}{\theta_l} \right) e^{-\left(\frac{x_l}{\theta_l}\right)} \left( 1 + \sum_{j=1}^{n} e^{-\left(\frac{x_j}{\theta_j}\right)} \right) - \frac{(\alpha + n)}{\theta_l^2} \left( \frac{x_l}{\theta_l} \right) e^{-\left(\frac{x_l}{\theta_l}\right)} \left( 1 + \sum_{j=1}^{n} e^{-\left(\frac{x_j}{\theta_j}\right)} \right) + \frac{(\alpha + n)}{\theta_l^2} \left( \frac{x_l}{\theta_l} \right)^2 e^{-2\left(\frac{x_l}{\theta_l}\right)} \left( 1 + \sum_{j=1}^{n} e^{-\left(\frac{x_j}{\theta_j}\right)} \right)^2, \quad l = 1, \ldots, n.
\]

**Appendix D. Expression of the main integral**

This Appendix gives the second main result of this paper which is the derivation of the expression of the following integral

\[
E \left[ \prod_{i=1}^{n} \left( e^{-\left(\frac{x_i}{\theta_i}\right)} \right)^{r_i} \right] = \int_{0}^{+\infty} \cdots \int_{0}^{+\infty} \prod_{i=1}^{n} \left( e^{-\left(\frac{x_i}{\theta_i}\right)} \right)^{r_i} f_n(x) \, dx, \quad (1)
\]

where, \( f_n(x) \) is the multivariate logistic density function. This derivation is done in the following steps:
First consider the following one dimensional integral:
\[
C_n = \int_0^{+\infty} \frac{\alpha + n - 1}{\theta_n} \left( e^{-\left(\frac{x_n}{\theta_n}\right)} \right)^{r_n} \left[ 1 + \sum_{j=1}^{n} e^{-\left(\frac{x_j}{\theta_j}\right)} \right]^{-\left(\alpha + n\right)} \, dx_n
\]

\[
= \int_0^{+\infty} \frac{\alpha + n - 1}{\theta_n} \left( e^{-\left(\frac{x_n}{\theta_n}\right)} \right)^{r_n} \left[ 1 + \sum_{j=1}^{n-1} e^{-\left(\frac{x_j}{\theta_j}\right)} \right]^{-\left(\alpha + n\right)} \left( 1 + \frac{e^{-\left(\frac{x_n}{\theta_n}\right)}}{1 + \sum_{j=1}^{n-1} e^{-\left(\frac{x_j}{\theta_j}\right)}} \right)^{-\left(\alpha + n\right)} \, dx_n.
\]

Note that, going from first line to second line is just a factorizing and rewriting the last term of the integrand. After looking for the links between logistic function and Gamma and Beta functions, we found that the following change of variable
\[
\left( 1 + \frac{e^{-\left(\frac{x_n}{\theta_n}\right)}}{1 + \sum_{j=1}^{n-1} e^{-\left(\frac{x_j}{\theta_j}\right)}} \right) = \frac{1}{1-t}, \quad 0 < t < 1,
\]

simplifies this integral and guides us to the following result
\[
C_n = \frac{\Gamma(r_n + 1)\Gamma(\alpha + n - r_n - 1)}{\Gamma(\alpha + n - 1)} \left( 1 + \sum_{j=1}^{n-1} e^{-\left(\frac{x_j}{\theta_j}\right)} \right)^{-\left(\alpha + n\right) + r_n + 1}.
\]

Then we consider the following similar expression:
\[
C_{n-1} = \frac{\Gamma(r_n + 1)\Gamma(\alpha + n - r_n - 1)}{\Gamma(\alpha + n - 1)} \int_0^{+\infty} \frac{\alpha + n - 2}{\theta_n-1} \left( e^{-\left(\frac{x_n}{\theta_n-1}\right)} \right)^{r_n-1} \, dx_n-1
\]

\[
e^{-\left(\frac{x_{n-1}}{\theta_{n-1}}\right)} \left[ 1 + \sum_{j=1}^{n-1} e^{-\left(\frac{x_j}{\theta_j}\right)} \right]^{-\left(\alpha + n\right) + r_n + 1} \, dx_n-1
\]

\[
= \frac{\Gamma(r_n + 1)\Gamma(\alpha + n - r_n - 1)}{\Gamma(\alpha + n - 1)} \int_0^{+\infty} \frac{\alpha + n - 2}{\theta_n-1} \left( e^{-\left(\frac{x_n}{\theta_n-1}\right)} \right)^{r_n-1} \left( 1 + \frac{e^{-\left(\frac{x_{n-1}}{\theta_{n-1}}\right)}}{1 + \sum_{j=1}^{n-2} e^{-\left(\frac{x_j}{\theta_j}\right)} \right) \right)^{-\left(\alpha + n\right) + r_n + 1} \, dx_n-1
\]

and again using the following change of variable:
\[
\left( 1 + \frac{e^{-\left(\frac{x_{n-1}}{\theta_{n-1}}\right)}}{1 + \sum_{j=1}^{n-2} e^{-\left(\frac{x_j}{\theta_j}\right)} \right) = \frac{1}{1-t},
\]
we obtain:

\[ C_{n-1} = \frac{\Gamma(r_{n-1} + 1)\Gamma(r_{n} + 1)\Gamma(\alpha + n - r_{n} - r_{n-1} - 1)}{\Gamma(\alpha + n - 2)} \left(1 + \sum_{j=1}^{n-2} e^{-\frac{r_{j}}{\theta_{j}}}ight)^{-\alpha+n+r_{n}+r_{n-1}+1} \]

Continuing this method, finally, we obtain the general expression:

\[ C_{1} = E \left[ \prod_{i=1}^{n} \left( e^{-\frac{X_{i}}{\theta_{i}}} \right)^{r_{i}} \right] = \frac{\Gamma(\alpha - \sum_{i=1}^{n} r_{i}) \prod_{i=1}^{n} \Gamma(1 + r_{i})}{\Gamma(\alpha)} \prod_{i=1}^{n} r_{i} < \alpha, \quad r_{i} > -1. \]

We may note that to simplify the lecture of the paper we did not give all the details of these calculations.
