Design, synthesis and fungicidal activity of isothiazole–thiazole derivatives†

Qi-Fan Wu,‡a Bin Zhao,‡a Zhi-Jin Fan,†a Jia-Bao Zhao,a Xiao-Feng Guo,a Dong-Yan Yang,*a Nai-Lou Zhang,a Bin Yu,a Tatiana Kalinina*b and Tatiana Glukhareva*b

3,4-Dichloroisothiazoles can induce systemic acquired resistance (SAR) to enhance plant resistance against a subsequent pathogen attack, and oxathiapiprolin exhibits excellent anti-fungal activity against oomycetes targeting at the oxysterol-binding protein. To discover novel chemicals with systemic acquired resistance and fungicidal activity, 21 novel isothiazole–thiazole derivatives were designed, synthesized and characterized according to the active compound derivatization method. Compound 6u, with EC50 values of 0.046 mg L\(^{-1}\) and 0.20 mg L\(^{-1}\) against Pseudoperonospora cubensis (Berk. et Curt.) Rostov and Phytophthora infestans in vivo, might act at the same target as oxysterol binding protein (PcORP1) of oxathiapiprolin; this result was validated by cross-resistance and molecular docking studies. The expression of the systemic acquired resistance gene pr1 was significantly up-regulated after treating with compound 6u for 24 h (43-fold) and 48 h (122-fold). These results can help the development of isothiazole–thiazole-based novel fungicides.

1 Introduction

Crops are often infected by various pathogens, which results in yield reduction. Oomycetes are filamentous eukaryotic microorganisms† that attack a large number of plants‡ and animals§ and therefore, they can sometimes threaten agricultural ecosystems. Some pathogens cause humanitarian disasters; for example, the Great Famine was caused by oomycetes attacking potato fields. The oomycetes classified as Phytophthora are one of the most serious pathogenic threats all over the world. Only Phytophthora infestans (Mont.) de Bary caused the failure of the potato crop protection in 1840s and decreased the population of Ireland nearly by 25%.§

Heterocyclic compounds are widely used in novel agro-chemical researches and developments. Thiazoles have attracted the interest of pharmaceutical and agrochemical anti-fungal research since the development of thiabendazole as a fungicide in 1962 by Merck. Oxathiapiprolin was developed by DuPont in 2007 as a piperidinyl thiazole isoxazoline fungicide targeting at oxysterol binding protein (PcORP1) against Peronospora belbahrii, Phytophthora parasitica var. Nicotianae (Breda de Hean) Tucker, Phytophthora capsici Leonian and downy mildew. However, fungicides acting at a single site of action have a high level of resistance risk.

As a derivative of 1,3-thiazole, isotianil has a wide range of biological activities including fungicidal, insecticidal, herbicidal and antiviral activities via activating the plant induced systemic resistance and affecting multiple links in the life cycle of pathogens. Particularly, 3,4-dichloroisothiazoles not only have antifungal activity, but also show good systemic acquired resistance. Novel fungicide development is one of the important directions and measures for fungicide resistance management.

On the basis of our former findings, to continue our aim of finding novel highly anti-fungal active compounds with novel modes of action and without resistance risks, 4 types of novel target molecules were designed and synthesized for fungicidal activity and systemic acquired resistance evaluation based on PcORP1 as the target and N and S containing five-membered heterocycles as bioactive substructures by the combination of bioactive substructures of plant elicitor isotianil and fungicide oxathiapiprolin according to the active compound derivatization method (Fig. 1 and Table 1). The mode of action of the active compound was validated by cross resistance, molecular biology and molecular docking studies.
2 Results and discussion

2.1 Chemistry

The synthesis route of isothiazole–thiazole derivatives is designed and shown in Scheme 1. Compound 1 was constructed according to reported procedures.\textsuperscript{17} 3,4-Dichloro-N-methoxy-N-methylisothiazole-5-carboxamide was obtained by the reaction between 3,4-dichloroisothiazole-5-carboxylic acid and N,N-dimethylhydroxylamine hydrochloride to produce the Weinreb amide, which was then reacted with methyl magnesium bromide to obtain 1-(3,4-dichloroisothiazol-5-yl)ethan-1-one with a good yield. Compound 2 could be prepared in one step from compound 1 by a substitution reaction with pyridinium tribromide. Compound 4 was synthesized by condensation between intermediate 2 and \textit{tert}-butyl 4-carbamothioylpiperidine-1-carboxylate. After removal of protection group at N-Boc of compound 4 under trifluoroacetic acid, intermediate 5 was obtained. By the activation of the corresponding acid using N'(3-dimethylaminopropyl)-N-ethylcarbodiimide hydrochloride and 1-hydroxybenzotriazole and the succeeding condensation with compound 5, isothiazole–thiazole derivatives 6 were effectively afforded. A crystal of the representative compound 6j was obtained from the mixture of dichloromethane and ethyl acetate for X-ray diffraction (Fig. 2).

2.2 Compound 6u has the same potent target as oxathiapiprozin

2.2.1 Fungicidal spectrum \textit{in vitro}. The median effective concentration (EC\textsubscript{50}) values of compounds 6a–6u with inhibition rates greater than 70\% at 50 mg L\textsuperscript{-1} are listed in Table 2. Both compounds 6o and 6s showed higher activities, with EC\textsubscript{50} values of 8.92 mg L\textsuperscript{-1} and 7.84 mg L\textsuperscript{-1}, respectively, than oxathiapiprozin (EC\textsubscript{50} = 296.60 mg L\textsuperscript{-1}) and azoxystrobin (EC\textsubscript{50} = 185.42 mg L\textsuperscript{-1}) against \textit{Alternaria solani}. The EC\textsubscript{50} values of compounds 6b (EC\textsubscript{50} = 0.22 mg L\textsuperscript{-1}) and 6c (EC\textsubscript{50} = 0.53 mg L\textsuperscript{-1}) were about 1/20 and 1/10, respectively, as compared to that of commercial fungicides oxathiapiprozin (EC\textsubscript{50} = 5.98 mg L\textsuperscript{-1}) and azoxystrobin (EC\textsubscript{50} = 4.04 mg L\textsuperscript{-1}) against \textit{Sclerotinia sclerotiorum}.

| Compound | n | R | R\textsuperscript{1} | Compound | n | R | R\textsuperscript{1} |
|----------|---|---|----------------|----------|---|---|----------------|
| 6a       | 1 |   |                | 6k       |   |   |                |
| 6b       | 1 |   |                | 6l       |   |   |                |
| 6c       |   |   |                | 6m       | 0 |   |                |
| 6d       |   |   |                | 6n       |   |   |                |
| 6e       | 0 |   |                | 6o       | 0 |   |                |
| 6f       |   |   |                | 6p       | 0 |   |                |
| 6g       |   |   |                | 6q       | 0 |   |                |
| 6h       |   |   |                | 6r       | 0 |   |                |
| 6i       | 0 |   |                | 6s       | 0 |   |                |
| 6j       |   |   |                | 6t       |   |   |                |
| 6u       | 0 |   |                |          |   |   |                |
2.2.2 Result of cross-resistance. The cross-resistance between oxathiapiprolin and 6u against P. capsici was detected. As shown in Table 3, the mutants LP3-m and LP3-h exhibited significant resistance to 6u (the inhibition rates were 12% and 7%, respectively, whereas the inhibition rate of LP3 was 32% at 10 mg L\(^{-1}\)). These results indicated that the oxysterol binding protein PcORP1, i.e., the target site of oxathiapiprolin was the potent target of 6u. These tentative results were further validated by docking studies.

2.2.3 Docking analysis. Molecular docking is the commonly used method to validate the potential target of pesticides. To elucidate the possible binding modes and affinities between the newly designed inhibitors and the potent target PcORP1, detailed interactions of oxathiapiprolin and compound 6u were docked into the active center of PsORP1 (Fig. 3). The conformation of PsORP1 in the complex with oxathiapiprolin was used as the control for molecular docking, and the docked complexes were shown by PyMol and LigPlot, which displayed potential bonding interactions for a hypothetical binding mode of oxathiapiprolin and PcORP1. The F atoms in trifluoromethyl of oxathiapiprolin could form a hydrogen bond with a NH of adjacent Asn765 in very excellent interaction. The thiazole ring of 6u could interact with Trp762 through \(\pi-\pi\) interaction. In the docked complexes between 6u and PsORP1, no hydrogen bond appeared. This might be the cause of poor activity of 6u towards PsORP1. However, \(\pi-\pi\) interaction between the piperidine ring of 6u and Trp762 appeared to be possible.

2.3 Results of compounds 6a–6u against oomycetes in vivo
The fungicidal activities of 6a–6u against oomycetes of P. cubensis and P. infestans at 100 mg L\(^{-1}\) in vivo are listed in Table 4. Most of the designed isothiazole–thiazole derivatives displayed excellent in vivo anti-oomycete activity (100%) against P. cubensis and P. infestans at 100 mg L\(^{-1}\), and the EC\(_{50}\) values of the compounds with inhibition over 90% at 100 mg L\(^{-1}\) against P. cubensis (Table 5) and P. infestans (Table 6) in vivo were determined.

Table 2 Toxicities (EC\(_{50}\) values) of the target compounds in vitro

\(^a\) Azoxystrobin, the data cited from the ref. 21. \(^b\) Azoxystrobin, the data cited from the ref. 22.
Systemic acquired resistance (SAR) is a predominant form of inducing disease resistance in plant defence systems. SAR promotes plant protection against pathogens through induced salicylic acid (SA) biosynthesis, activated SA signalling pathway and enhanced expression of pathogenesis-related proteins (PRs). In particular, the expressed pr1 is a marker gene for SAR activation and NPR1 is an SA receptor that leads to pr1 activation.

"**" and "****" indicate significant difference between treated and mock at \( P < 0.05 \) and \( P < 0.01 \), respectively.

The expressions of npr1 and pr1 were analyzed in A. thaliana. The pr1 expression was significantly up-regulated by 64-fold and 413-fold when treated with 6u for 24 hours and 48 hours, respectively (Fig. 4). The npr1 expression was also significantly up-regulated by 4.7-fold after 48 hours of treatment, but the change was not very significant when treated for 24 hours.

Isotianil, discovered by Bayer CropScience AG in 1997 and developed jointly with Sumitomo Chemical Co., Ltd, is used as a crop protectant against rice blast and rice leaf blight. The difference in gene expressions identified after isotianil treatment for 24 hours and 48 hours in Oryza sativa by microarray

### Table 3  Oomycete sensitivity in wild-type and oxathiapiprolin-resistant strains of P. capsici

| Strains                        | 6u (10 mg L\(^{-1}\)) | Oxathiapiprolin (10 mg L\(^{-1}\)) | Oxathiapiprolin (1 mg L\(^{-1}\)) |

acid were provided by Jia-xing Huang of China Agricultural University (Beijing, China). Melting points (temperature uncorrected) were recorded on an X-4 binocular microscope. \(^1\)H and \(^{13}\)C Nuclear Magnetic Resonance (NMR) spectra in CDCl\(_3\) or dimethyl sulfoxide-d6 were recorded on a Bruker AV400 spectrometer with tetramethylsilane as the internal standard. Mass spectrometry was conducted using Agilent 6520 Q-TOF LC/MS. The single crystal diffraction was carried out on a Rigaku 007HF XtaLAB P200 diffractometer with tetramethylsilane as the internal standard.

3.2 Synthesis

3.2.1 Synthesis and characterization of compound 2. To a solution of compound 1 (15.3 mmol) in 5 mL of 33\% HBr and CH\(_3\)COOH, pyridinium tribromide (18.8 mmol) was added. The reaction mixture was stirred overnight at room temperature. A white solid (3.19 mmol, 92\%). Mp 97–99 °C; \(^1\)H NMR (400 MHz, CDCl\(_3\)) \(\delta\) 8.40 (s, 1H, thiazole-CH), 5.91 (s, 1H, NH), 3.22 (t, \(J\) = 11.6 Hz, 2H, piperidine-CH\(_2\)), 2.78 (t, \(J\) = 11.7 Hz, 2H, piperidine-CH\(_2\)), 1.76 (m, 2H, piperidine-CH\(_2\)) \(\text{HRMS [M + H]}^+\) calcd for \(\text{C}_{16}\text{H}_{18}\text{Cl}_2\text{N}_3\text{O}_2\text{S}_2\): 442.0296, found: 442.0345; HRMS (ESI) (M + Na\(^+\)) calcd for \(\text{C}_{16}\text{H}_{18}\text{Cl}_2\text{N}_3\text{O}_2\text{S}_2\): 414.0183.

3.2.2 Synthesis and characterization of compound 4. A solution of tert-butyl 4-carbamothioylpiperidine-1-carboxylate 3 (8.25 mmol), which can be prepared from piperidine-4-carboxamide,\(^{99}\) in tetrahydrofuran (50 mL) was added to the intermediate 2 (9.07 mmol) while stirring and refluxing for 3 h. The solvent was evaporated, and the residue was dissolved using ethyl acetate (50 mL). The organic layer was washed with sodium hydroxide solution (1 mol L\(^{-1}\), 50 mL) and saturated brine (50 mL) successively and then dried over anhydrous sodium sulfate. After the solvent was removed under reduced pressure, the residue was purified by column chromatography on a silica gel using ethyl acetate and petroleum ether (60–90 °C) with \(v/v\) of 1:16 to obtain 4 as a white solid (3.48 mmol, 42\%). Mp 153–155 °C; \(^1\)H NMR (400 MHz, CDCl\(_3\)) \(\delta\) 8.04 (s, 1H, thiazole-CH), 4.21 (t, \(J\) = 10.7 Hz, 2H, piperidine-CH\(_2\)), 3.19 (m, 1H, piperidine-CH\(_3\)), 2.93 (t, \(J\) = 12.1 Hz, 2H, piperidine-CH\(_2\)), 2.13 (m, 2H, piperidine-CH\(_2\)), 1.77 (m, 2H, piperidine-CH\(_2\)), 1.46 (s, 9H, CH\(_3\)). HRMS (ESI) [M + H\(^+\)] calcd for \(\text{C}_{16}\text{H}_{19}\text{Cl}_2\text{N}_3\text{O}_2\text{S}_2\): 420.0296, found: 420.0345; HRMS (ESI) [M + Na\(^+\)] calcd for \(\text{C}_{16}\text{H}_{19}\text{Cl}_2\text{N}_3\text{O}_2\text{S}_2\): 492.0296, found: 492.0183.

3.2.3 Synthesis and characterization of compound 5. To an ice-cooled solution of 4 (3.48 mmol) in dry dichloromethane (30 mL), trifluoroacetic acid (87 mmol) was added, and the reaction mixture was stirred at room temperature for 2 h. After completion of the conversion, dichloromethane (50 mL) was added again and the pH was adjusted to 8 with sodium hydroxide solution (1 mol L\(^{-1}\)). Then, the organic layer was extracted and washed using saturated brine (50 mL). After drying the organic layer over anhydrous sodium sulfate, the solvent dichloromethane (50 mL) was added again and the pH was adjusted to 8 with sodium hydroxide solution (1 mol L\(^{-1}\)). Then, the organic layer was extracted and washed using saturated brine (50 mL). After the organic layer was dried over anhydrous sodium sulfate, the solvent was removed under reduced pressure and the residue was purified by column chromatography on a silica gel using dichloromethane, methanol, and triethylamine with \(v/v/v\) of 6:1:0.001 to obtain 5 as a white solid (3.19 mmol, 92\%). Mp 97–99 °C; \(^1\)H NMR (400 MHz, CDCl\(_3\)) \(\delta\) 8.04 (s, 1H, thiazole-CH), 5.31 (s, 1H, NH), 3.22 (t, \(J\) = 11.6 Hz, 2H, piperidine-CH\(_2\)), 3.17 (s, 1H, piperidine-CH\(_3\)), 2.78 (t, \(J\) = 11.7 Hz, 2H, piperidine-CH\(_2\)), 2.14 (m, 2H, piperidine-CH\(_2\)), 1.76 (m, 2H, piperidine-CH\(_2\)). HRMS (ESI) [M + H\(^+\)] calcd for \(\text{C}_{11}\text{H}_{11}\text{Cl}_2\text{N}_3\text{O}_2\text{S}_2\): 319.9771, found: 319.9850.

3.2.4 General procedure for the preparation of title compounds. The solution of 2-[5-methyl-3-(trifluoromethyl)-1H-pyrazol-1-yl]acetic acid (0.395 mmol), \(N\)-[3(dimethylamino)-propyl]-\(N\)-ethylcarbodiimide hydrochloride (0.451 mmol) and 1-hydroxybenzotriazole (0.395 mmol) in dry CH\(_2\)Cl\(_2\) (10 mL) was cooled to 0 °C, and the mixture was stirred for 1 h under nitrogen atmosphere. Then, the mixture of compound 5 (0.376 mmol) in dry CH\(_2\)Cl\(_2\) (10 mL) and Et\(_3\)N (0.451 mmol) were added. The reaction mixture was stirred overnight at room temperature. After stopping the reaction, the mixture was washed with saturated NaHCO\(_3\) (20 mL) and brine (20 mL). The organic layer was dried (sodium sulfate anhydrous) and concentrated, and the residue was purified by column chromatography on a silica gel using ethyl acetate and petroleum ether (60–90 °C) with \(v/v\) of 1:9:1:3 to obtain target compound 6a.

Compounds 6b to 6u were synthesized according to a similar procedure as that used for 6a by changing the raw materials, as shown in Scheme 1.

Data for 6a. White solid, mp > 200 °C; yield 60\%, \(^1\)H NMR (400 MHz, DMSO) \(\delta\) 8.08 (s, 1H, thiazole-CH), 6.35 (s, 1H, pyrazole-CH), 5.01 (s, 2H, CH\(_2\)), 4.58 (d, \(J\) = 13.3 Hz, 1H, piperidine-CH\(_3\)), 4.08 (d, \(J\) = 12.5 Hz, 1H, piperidine-CH\(_3\)), 3.33 (s, 2H, piperidine-CH\(_2\)), 2.93 (m, 1H, piperidine-CH\(_2\)), 2.34 (s, 3H, CH\(_3\)), 2.22 (m, 2H, piperidine-CH\(_2\)), 1.91–1.68 (m, 2H, piperidine-CH\(_2\)). ### 3.3 In vitro antifungal activity test

The fungicidal activities of title compounds against *Cercospora arachidicola* (C. A), *Alternaria solani* (A. S), *Botrytis cinerea* (B. C), *Gibberella zeae* (G. Z), *Physalospora piricola* (P. P), *Sclerotinia sclerotiorum* (S. S), *Rhizoctonia cerealis* (R. C) and *Pellicularia sasakii* (P. S) were tested at 50 mg L⁻¹ in *in vitro* by the mycelium growth rate method according to our previous publications.³⁶,³¹ Commercial fungicides oxathiapiprolin, isolatin and azoxystrobin were chosen as positive controls. The EC₅₀ values of the compounds with fungal growth inhibition greater than 70% at 50 mg L⁻¹ were measured.

### 3.4 Oomycete sensitivity in wild-type and oxathiapiprolin-resistant strains of *P. capsici*

The *P. capsici* strains of the oxathiapiprolin-resistant mutants LP3-m, LP3-h and wild-type LP3 (ref. 32) were used for the effectiveness tests of compound 6u and oxathiapiprolin by measuring their colony diameters after dark-incubation at 25 °C for 5 days. Each strain and concentration were measured in three plates and the experiments were performed for three times.

### 3.5 Molecular modelling studies and docking analysis of PsORP1

For molecular modelling, the structure of PsORP1 (ref. 32) (Protein ID: 558498) in *Phytophthora capsici* was generated using the homology model application within the YASARA program with default parameters. The binding center of PsORP1 was identified by aligning to the template structure in Autodock Tools.³⁴,³⁵ The coordinate of the binding center in PsORP1 was identified by the model structures of 4BZ and 5H2D. The structures of the ligands were optimized with the ligand minimization protocol. The molecular docking analysis was performed by Autodock Tools and ten random conformations were generated for each ligand. The rest of the parameters were set to default values. The optimal structure of the complex was selected based on visual inspection and the docking score. The structures of the complexes were shown by Pymol and LigPlot.³⁷

### 3.6 In vivo antifungal activity test

The protective activities in potted plants of the title compounds were determined by the procedures described below:³³ compounds 6a–6u (10.0 mg) and positive controls oxathiapiprolin and isolatin were dissolved in 0.5 mL DMF solutions. Then, they were diluted using 95.5 mL of distilled water (containing 0.1% Tween 80) to obtain the working solutions of 100 mg L⁻¹. The working solutions were sprayed on to the host plant using a sprayer when the plants were grown to 1 to 3 leaf stages. After 24 h, the leaves treated by working solution were inoculated by the fungi of *P. cubensis* and *P. infestans*; 7 days later, the inhibitory activities in *in vivo* of all the compounds were assessed. Two concentrations of 10 mg L⁻¹ and 1 mg L⁻¹ were further tested for the compounds with activity over 90% against *P. cubensis* at 100 mg L⁻¹. Then, the compounds with more than 90% inhibition against *P. cubensis* at 1 mg L⁻¹ were investigated at 0.1 mg L⁻¹, 0.01 mg L⁻¹ and 0.001 mg L⁻¹. The compounds with 100% inhibition rate against *P. infestans* were tested for 3 concentrations of 10 mg L⁻¹, 1 mg L⁻¹ and 0.1 mg L⁻¹. An inhibition rate of 100% represents complete control of the fungal growth and an inhibition rate of 0% represents no control of the fungal growth.

### 3.7 RNA extraction and Q-PCR analysis of the expression of defence genes in the salicylic acid pathway

Based on the difference between anti-oomycete activities in *in vivo* and *in vitro*, we proposed that compound 6u might be able to induce systemic acquired resistance of plants. The RNAs of *Arabidopsis thaliana*, which was treated with 6u (10 mg L⁻¹) and DMF, were isolated by using E.Z.N.A.® Plant RNA Kit (Omega, USA) and the mRNA was transcribed into cDNA reversely. Q-PCR was performed using the 2⁻ΔΔCt method with TransStart Top
Green Q-PCR Super Mix (K31102, TransStart, China). The expressions of defense genes pr1 and npr1 in the salicylic acid pathway were analyzed and the primers used for Q-PCR are shown in Table 7.

### Table 7 Primmers for Q-PCR

| Gene ID       | Gene name | Primer-F                             | Primer-R                             |

4 Conclusions

A series of novel isothiazole–thiazole derivatives were designed, synthesized and rationally characterized. The novel compounds were screened for antifungal activity in vitro and anti-oomycete activity in vivo. Compound 6u exhibited excellent anti-oomycete activity in vivo with EC50 values of 0.046 mg L−1 and 0.27 mg L−1 against *P. cubensis* and *P. infestans*, respectively. Although 6u was not as effective as oxathiapiprolin, it was much better than isothianil, a compound which can induce plant systemic acquired resistance. Therefore, isothiazole–thiazole derivatives are worthy of further research. Since the docking experiments indicated that oxathiapiprolin can form a hydrogen bond with Asn 765 of PsORP1, analogues with appropriately placed N–H, O–H and F–H units in a target molecule will be designed for further improvement of anti-fungal activity of compound 6u.
