On Stability of a General Bilinear Functional Equation

Anna Bahyrycz and Justyna Sikorska

Abstract. We prove the Hyers–Ulam stability of the functional equation
\[
    f(a_1x_1 + a_2x_2, b_1y_1 + b_2y_2) = C_1f(x_1, y_1) \\
    + C_2f(x_1, y_2) + C_3f(x_2, y_1) + C_4f(x_2, y_2)
\]  

(*)

in the class of functions from a real or complex linear space into a Banach space over the same field. We also study, using the fixed point method, the generalized stability of (*) in the same class of functions. Our results generalize some known outcomes.

Mathematics Subject Classification. 39B52, 39B82, 47J25, 47D03.

Keywords. Hyers–Ulam stability, Generalized stability, Functional equation, Fixed point, Nonlinear operator, Linear operator.

1. Introduction

Problem of studying the stability of functional equations has begun with a question posed by S. Ulam (see, e.g., [17]) and an answer given by D.H. Hyers [13]. Since then a number of papers investigating the so called now Hyers–Ulam stability have appeared. The results concern also various generalizations of the problem and these kind of research have their origins in the papers by T. Aoki [1], D.G. Bourgin [7], Th. Rassias [16], P. Gavruta [11].

Let $X$ and $Y$ be linear spaces over the same field $\mathbb{F} \in \{\mathbb{R}, \mathbb{C}\}$, $a_1, a_2, b_1, b_2 \in \mathbb{F} \setminus \{0\}$, $C_1, C_2, C_3, C_4 \in \mathbb{F}$ and $f : X^2 \to Y$. In [10], K. Ciepliński starting with a bilinear mapping, i.e., linear in each of its arguments, considered the following functional equation
\[ f(a_1x_1 + a_2x_2, b_1y_1 + b_2y_2) = C_1f(x_1, y_1) \]
\[ + C_2f(x_1, y_2) + C_3f(x_2, y_1) + C_4f(x_2, y_2) \]  
for all \( x_1, x_2, y_1, y_2 \in X \), and investigated, among others, its Hyers–Ulam stability in Banach spaces. In fact, he proved the stability without knowing the general solution of (1) and under some additional assumptions. In [6], the authors described the form of solutions of (1). They were also studying relations between (1) and bilinear mappings.

In the present paper, firstly knowing already the form of solutions of (1) we prove its Hyers–Ulam stability, also in the cases excluded in [10]. Secondly, applying the fixed point method, we study the generalized stability of (1) for the same classes of control functions.

Particular cases of (1) are, among others, the following three functional equations:

\[ f(x_1 + x_2, y_1 + y_2) = f(x_1, y_1) + f(x_1, y_2) + f(x_2, y_1) + f(x_2, y_2), \]
\[ 4f\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right) = f(x_1, y_1) + f(x_1, y_2) + f(x_2, y_1) + f(x_2, y_2), \]
\[ 2f\left(x_1 + x_2, \frac{y_1 + y_2}{2}\right) = f(x_1, y_1) + f(x_1, y_2) + f(x_2, y_1) + f(x_2, y_2), \]

that is, the equations which characterize biadditive, bi-Jensen and Cauchy-Jensen mappings, respectively. Therefore, our results generalize stability outcomes for these equations (see, e.g., [2–5, 9, 14, 15]).

Define \( C := C_1 + C_2 + C_3 + C_4 \).

For the convenience of the reader we recall here a result describing the solutions of (1) (see [6], and also [12], where \( Y \) is an arbitrary field of characteristic different from two).

**Theorem 1.** If \( f : X^2 \to Y \) satisfies (1), then there exist a biadditive function \( g : X^2 \to Y \), additive functions \( \varphi, \psi : X \to Y \) and a constant \( \delta \in Y \) such that

\[ f(x, y) = g(x, y) + \varphi(x) + \psi(y) + \delta, \]

and

\[ g(a_1x, b_1y) = C_1g(x, y), \]
\[ g(a_1x, b_2y) = C_2g(x, y), \]
\[ g(a_2x, b_1y) = C_3g(x, y), \]
\[ g(a_2x, b_2y) = C_4g(x, y), \]
\[ \varphi(a_1x) = (C_1 + C_2)\varphi(x), \]
\[ \varphi(a_2x) = (C_3 + C_4)\varphi(x), \]
\[ \psi(b_1y) = (C_1 + C_3)\psi(y), \]
\[ \psi(b_2y) = (C_2 + C_4)\psi(y), \]

for all \( x, y \in X \), and

\[ \delta(C - 1) = 0. \]
Conversely, each function $f$ of the form (2) with $g$ biadditive, $\varphi, \psi$ additive, and such that conditions (3), (4), (5), (6) are satisfied, is a solution of (1).

Throughout this paper we keep the standard notation: $\mathbb{N}, \mathbb{R}$ and $\mathbb{C}$ stand for the sets of all positive integers, all real numbers and all complex numbers, respectively. Moreover, we denote $\mathbb{R}_+:=[0, \infty)$, $\mathbb{N}_0:=\mathbb{N} \cup \{0\}$ and we adopt the convention $0^0=1$.

2. Hyers–Ulam Stability of (1)

We start the section with recalling two stability results: for the Cauchy equation (see [13]) and for the biadditivity equation (see, e.g., [5,9]).

Lemma 1. Let $(H, +)$ be an abelian group and $(Y, \| \cdot \|)$ be a Banach space. Given $\varepsilon>0$ assume that $f: H \to Y$ satisfies

$$\|f(x+y) - f(x) - f(y)\| \leq \varepsilon, \quad x, y \in H.$$  

Then there exists an additive function $F: H \to Y$ such that

$$\|f(x) - F(x)\| \leq \varepsilon, \quad x \in H.$$  

Moreover, $F$ is a unique function satisfying the above condition and it is of the form $F(x) = \lim_{n \to \infty} \frac{1}{2^n} f(2^n x)$ for all $x \in H$.

Lemma 2. Let $(H, +)$ be an abelian group and $(Y, \| \cdot \|)$ be a Banach space. Given $\varepsilon>0$ assume that $g: H^2 \to Y$ satisfies

$$\|g(x_1 + x_2, y_1 + y_2) - g(x_1, y_1) - g(x_1, y_2) - g(x_2, y_1) - g(x_2, y_2)\| \leq \varepsilon, \quad x_1, x_2, y_1, y_2 \in H.$$  

Then there exists an additive function $G: H^2 \to Y$ such that

$$\|g(x, y) - G(x, y)\| \leq \frac{1}{3} \varepsilon, \quad x, y \in H.$$  

Moreover, $G$ is a unique function satisfying the above condition and it is of the form $G(x, y) = \lim_{n \to \infty} \frac{1}{4^n} g(2^n x, 2^n y)$ for all $x, y \in H$.

Now we are able to present the main result of this section.

Theorem 2. Let $(Y, \| \cdot \|)$ be a Banach space and $\varepsilon>0$. Assume that $f: X^2 \to Y$ is a mapping such that

$$\|f(a_1 x_1 + a_2 x_2, b_1 y_1 + b_2 y_2) - C_1 f(x_1, y_1) - C_2 f(x_1, y_2) - C_3 f(x_2, y_1) - C_4 f(x_2, y_2)\| \leq \varepsilon$$  

(7)

for $x_1, x_2, y_1, y_2 \in X$. Then there exists a solution $F: X^2 \to Y$ of (1) such that

$$\|f(x, y) - f(0, 0) - F(x, y)\| \leq 14\varepsilon, \quad x, y \in X.$$  

(8)

Moreover, if $C \neq 1$ then $F$ is a unique solution of (1) such that (8) holds.
Proof. Immediately from (7) we obtain the following inequalities
\[
\|f(x_1, 0) - C_1f(x_1, 0) - C_2f(x_2, 0) - C_3f(x_2, 0) - C_4f(x_2, 0)\| \leq \varepsilon, \tag{9}
\]
\[
\|f(0, y_1) - C_1f(0, y_1) - C_2f(0, y_2) - C_3f(0, y_2) - C_4f(0, y_2)\| \leq \varepsilon, \tag{10}
\]
for all \(x_1, x_2, y_1, y_2 \in X\), and
\[
\|(1 - C)f(0, 0)\| \leq \varepsilon. \tag{11}
\]
Therefore, the functions \(\varphi(x) := f(x, 0) - f(0, 0)\) for \(x \in X\), and \(\psi(y) := f(0, y) - f(0, 0)\) for \(y \in X\), satisfy the conditions
\[
\|\varphi(a_1x_1 + a_2x_2) - C_1\varphi(x_1) - C_2\varphi(x_1) - C_3\varphi(x_2) - C_4\varphi(x_2)\| \leq 2\varepsilon \tag{12}
\]
and
\[
\|\psi(b_1y_1 + b_2y_2) - C_1\psi(y_1) - C_2\psi(y_2) - C_3\psi(y_1) - C_4\psi(y_2)\| \leq 2\varepsilon, \tag{13}
\]
respectively.

By (7) we also have
\[
\|f(a_1x_1, 0) - C_1f(x_1, 0) - C_2f(x_1, 0) - C_3f(0, y_1) - C_4f(0, 0)\| \leq \varepsilon, \\
\|f(a_1x_1, y_2) - C_1f(x_1, 0) - C_2f(x_1, 0) - C_3f(0, y_1) - C_4f(0, 0)\| \leq \varepsilon, \\
\|f(a_2x_2, b_1y_1) - C_1f(0, y_1) - C_2f(0, y_2) - C_3f(x_2, y_1) - C_4f(x_2, 0)\| \leq \varepsilon, \\
\|f(a_2x_2, b_2y_2) - C_1f(0, 0) - C_2f(0, y_2) - C_3f(x_2, 0) - C_4f(x_2, y_2)\| \leq \varepsilon \tag{14}
\]
and, moreover,
\[
\|f(a_1x_1, 0) - (C_1 + C_2)f(x_1, 0) - (C_3 + C_4)f(0, 0)\| \leq \varepsilon, \\
\|f(a_2x_2, 0) - (C_3 + C_4)f(x_2, 0) - (C_1 + C_2)f(0, 0)\| \leq \varepsilon, \\
\|f(0, b_1y_1) - (C_1 + C_3)f(0, y_1) - (C_2 + C_4)f(0, 0)\| \leq \varepsilon, \\
\|f(0, b_2y_2) - (C_2 + C_4)f(0, y_2) - (C_1 + C_3)f(0, 0)\| \leq \varepsilon. \tag{15}
\]
From (7), (11), (14) and (15) it follows that
\[
\|f(a_1x_1 + a_2x_2, b_1y_1 + b_2y_2) - f(a_1x_1, b_1y_1) - f(a_1x_1, b_2y_2) - f(a_2x_2, b_1y_1) - f(a_2x_2, b_2y_2) + f(x_1, 0) - f(0, 0)\| \leq 10\varepsilon,
\]
and, since \(a_1a_2b_1b_2 \neq 0\),
\[
\|f(x_1 + x_2, y_1 + y_2) - f(x_1, y_1) - f(x_1, y_2) - f(x_2, y_1) - f(x_2, y_2) + f(x_1, 0) + f(x_2, 0) + f(0, y_1) + f(0, y_2) - f(0, 0)\| \leq 10\varepsilon. \tag{16}
\]
From (9), (11) and (15) we obtain
\[ \| f(x_1 + x_2, 0) - f(x_1, 0) - f(x_2, 0) + f(0, 0) \| \leq 4\varepsilon, \quad (17) \]
and by (10), (11) and (15) we have
\[ \| f(0, y_1 + y_2) - f(0, y_1) - f(0, y_2) + f(0, 0) \| \leq 4\varepsilon, \quad (18) \]
so, for all \( x_1, x_2, y_1, y_2 \in X, \)
\[ \| \varphi(x_1 + x_2) - \varphi(x_1) - \varphi(x_2) \| \leq 4\varepsilon \quad \text{and} \quad \| \psi(y_1 + y_2) - \psi(y_1) - \psi(y_2) \| \leq 4\varepsilon. \]
On account of Lemma 1, there exist a unique additive function \( \Phi \) and a unique additive function \( \Psi \) such that
\[ \| \varphi(x) - \Phi(x) \| \leq 4\varepsilon, \quad \| \psi(x) - \Psi(x) \| \leq 4\varepsilon, \quad x \in X, \quad (19) \]
with
\[ \Phi(x) = \lim_{n \to \infty} \frac{1}{2^n} \varphi(2^n x), \quad \Psi(x) = \lim_{n \to \infty} \frac{1}{2^n} \psi(2^n x), \quad x \in X. \]
Therefore using (12) and (13), we derive that the functions \( F_1(x, y) := \Phi(x) \)
and \( F_2(x, y) := \Psi(y), \) for \( x, y \in X, \) satisfy (1).
Let us define \( g : X^2 \to Y \) by
\[ g(x, y) := f(x, y) - f(x, 0) - f(0, y) + f(0, 0), \quad x, y \in X. \quad (20) \]
Then
\[ f(x, y) = g(x, y) + f(x, 0) + f(0, y) - f(0, 0) = g(x, y) + \varphi(x) + \psi(y) + f(0, 0) \]
and by (7), (9), (10) and (11), we get
\[ \| g(a_1 x_1 + a_2 x_2, b_1 y_1 + b_2 y_2) - C_1 g(x_1, y_1) - C_2 g(x_1, y_2) \]
\[ - C_3 g(x_2, y_1) - C_4 g(x_2, y_2) \| \leq 4\varepsilon. \quad (21) \]
On account of (16), (17), (18) and (20), we obtain
\[ \| g(x_1 + x_2, y_1 + y_2) - g(x_1, y_1) - g(x_1, y_2) - g(x_2, y_1) - g(x_2, y_2) \| \leq 18\varepsilon. \]
By Lemma 2, there exists a unique biadditive function \( G \) such that
\[ \| g(x, y) - G(x, y) \| \leq 6\varepsilon, \quad (22) \]
and, moreover, \( G(x, y) = \lim_{n \to \infty} \frac{1}{2^n} g(2^n x, 2^n y). \) Using (21), we obtain that \( G \)
satisfies (1).
Let us define
\[ F(x, y) := G(x, y) + \Phi(x) + \Psi(y), \quad x, y \in X. \quad (23) \]
Function \( F \) satisfies (1) and from (19) and (22) we get
\[ \| f(x, y) - f(0, 0) - F(x, y) \| \leq \| g(x, y) - G(x, y) \| + \| \varphi(x) - \Phi(x) \|
\]
\[ + \| \psi(y) - \Psi(y) \| \leq 14\varepsilon. \]
For the proof of the uniqueness, assume that $C \neq 1$ and let $F'$ be another function satisfying (1) and inequality (8). Therefore, $F'$ is of the form (cf., Theorem 1)

$$F'(x, y) = G'(x, y) + \Phi'(x) + \Psi'(y) + \delta', \quad x, y \in X,$$

with biadditive $G'$, additive $\Phi'$ and $\Psi'$, satisfying (3), (4) and (5), respectively, and with $\delta' = 0$ in the case $C \neq 1$.

We have for all $x, y \in X$, $n \in \mathbb{N}$,

$$\|F(nx, ny) - F'(nx, ny)\| \leq 28\varepsilon,$$

$$\|G(nx, ny) + \Phi(nx) + \Psi(ny) - G'(nx, ny) - \Phi'(nx) - \Psi'(ny)\| \leq 28\varepsilon,$$

$$\|n^2(G(x, y) - G'(x, y)) + n(\Phi(x) + \Psi(y) - \Phi'(x) - \Psi'(y))\| \leq 28\varepsilon.$$

Dividing the above inequality by $n^2$ side by side and letting $n$ tend to infinity we obtain $G = G'$, and consequently,

$$\Phi(x) + \Psi(y) = \Phi'(x) + \Psi'(y) \quad x, y \in X.$$ 

It is now enough to set $y = 0$ and then $x = 0$ in order to obtain $\Phi = \Phi'$ and $\Psi = \Psi'$, respectively. □

**Remark 1.** A thorough inspection of the proof of Theorem 2 shows that in the case $C = 1$ we are able to obtain a better approximation. Namely, if $f: X^2 \to Y$ is a mapping satisfying (7) for $x_1, x_2, y_1, y_2 \in X$ and $C = 1$, then there exists a solution $F: X^2 \to Y$ of (1) such that

$$\|f(x, y) - f(0, 0) - F(x, y)\| \leq 11\varepsilon, \quad x, y \in X. \quad (24)$$

**Remark 2.** It is also easy to observe that in the case $C = 1$ we do not have the uniqueness of function $F$ in (8). Indeed, each function $\overline{F}: X^2 \to Y$,

$$\overline{F} := G + \Phi + \Psi + \delta'$$

with $G, \Phi, \Psi$ defined as in the proof of Theorem 2, and with $\delta' \in Y$ such that

$$\|\delta'\| \leq 3\varepsilon$$

satisfies, on account of Remark 1, conditions (1) and (8).

### 3. Generalized Stability of (1)

In this section we provide some results concerning generalized stability with various approximation functions. In what follows we will use a notation

$$(\Phi f)(x_1, y_1, x_2, y_2) := f(a_1 x_1 + a_2 x_2, b_1 y_1 + b_2 y_2)$$

$$- C_1 f(x_1, y_1) - C_2 f(x_1, y_2) - C_3 f(x_2, y_1) - C_4 f(x_2, y_2)$$

for $x_1, x_2, y_1, y_2 \in X$. Let us also denote $a := a_1 + a_2$ and $b := b_1 + b_2$.

Our first result reads as follows.
Theorem 3. Suppose that \((Y, \| \cdot \|)\) is a Banach space, \(C \neq 0, a \neq 0, b \neq 0\). Let \(f: X^2 \to Y\) and \(\theta: X^4 \to \mathbb{R}_+\) be mappings satisfying the inequality
\[
\| (\Phi f)(x_1, y_1, x_2, y_2) \| \leq \theta(x_1, y_1, x_2, y_2), \quad x_1, x_2, y_1, y_2 \in X. \tag{25}
\]
Assume, further, that for an \(s \in \{-1, 1\}\) (depending on \(a, b, C\)) we have
\[
\varepsilon^*(x, y) := \sum_{n=0}^{\infty} \theta\left(a^{sn+\frac{s-1}{2}} x, b^{sn+\frac{s-1}{2}} y, a^{sn+\frac{s+1}{2}} x, b^{sn+\frac{s+1}{2}} y\right) \left| C^{sn+\frac{s+1}{2}} \right| < \infty, \quad x, y \in X, \tag{26}
\]
and
\[
\lim_{n \to \infty} \frac{\theta(a^{sn} x, b^{sn} y, a^{sn} x, b^{sn} y)}{|C|^{sn}} = 0, \quad x_1, x_2, y_1, y_2 \in X. \tag{27}
\]
Then there exists a unique solution \(F: X^2 \to Y\) of (1) such that
\[
\| f(x, y) - F(x, y) \| \leq \varepsilon^*(x, y), \quad x, y \in X. \tag{28}
\]
Proof. Putting \(x_1 = x_2 = x\) and \(y_1 = y_2 = y\) in (25) we get
\[
\| f(ax, by) - Cf(x, y) \| \leq \theta(x, y, x, y), \quad x, y \in X,
\]
whence,
\[
\left\| \frac{f(ax, by)}{C} - f(x, y) \right\| \leq \frac{1}{|C|} \theta(x, y, x, y), \quad x, y \in X. \tag{29}
\]
Similarly, putting \(x_1 = x_2 = \frac{x}{a}\) and \(y_1 = y_2 = \frac{y}{b}\) in (25) we obtain
\[
\left\| f(x, y) - Cf\left(\frac{x}{a}, \frac{y}{b}\right) \right\| \leq \theta\left(\frac{x}{a}, \frac{y}{b}, \frac{x}{a}, \frac{y}{b}\right), \quad x, y \in X. \tag{30}
\]
Define
\[
(T \xi)(x, y) := \frac{1}{C^s} \xi(a^s x, b^s y), \quad \xi \in Y^{X^2}, \quad x, y \in X, \tag{31}
\]
and
\[
\varepsilon(x, y) := \begin{cases} 
\frac{1}{|C|} \theta(x, y, x, y), & \text{for } s = 1, \\
\theta\left(\frac{x}{a}, \frac{y}{b}, \frac{x}{a}, \frac{y}{b}\right), & \text{for } s = -1,
\end{cases}
\]
for all \(x, y \in X\). Then, for any \(\xi, \mu: X^2 \to Y, \ x, y \in X\) we have
\[
\| (T \xi)(x, y) - (T \mu)(x, y) \| = \frac{1}{|C|^s} \| \xi(a^s x, b^s y) - \mu(a^s x, b^s y) \|
\]
and by (29) and (30),
\[
\| (T f)(x, y) - f(x, y) \| \leq \varepsilon(x, y), \quad x, y \in X. \tag{29*}
\]
Next, put
\[
(\Lambda \eta)(x, y) := \frac{1}{|C|^s} \eta(a^s x, b^s y), \quad \eta \in \mathbb{R}_+^{X^2}, \quad x, y \in X.
\]
As one can check,

\[(\Lambda^n \varepsilon)(x, y) = \varepsilon \left( a^{sn}x, b^{sn}y \right) = \frac{\theta(a^{n}x, b^{n}y, a^{n}x, b^{n}y)}{|C|^{sn}}, \quad \text{for } s = 1,
\]

\[= \frac{|C|^{n+1}}{|C|^{n}} \theta \left( \frac{x}{a^{n+1}}, \frac{y}{b^{n+1}} \right) , \quad \text{for } s = -1,
\]

for all \( x, y \in X, \ n \in \mathbb{N}_0. \)

The operators \( T: Y \times \mathbb{R} \rightarrow Y \times \mathbb{R} \) and \( \Lambda: \mathbb{R}_+ \rightarrow \mathbb{R}_+ \) satisfy the assumptions of Theorem 1 in [8], therefore, there exists a unique fixed point \( F: X^2 \rightarrow Y \) of \( T \) such that (28) holds. Moreover,

\[F(x, y) = \lim_{n \to \infty} (T^n f)(x, y), \quad x, y \in X.
\]

Now, we prove that for any \( x_1, x_2, y_1, y_2 \in X \) and \( n \in \mathbb{N}_0 \) we have

\[\| (\Phi(T^n f))(x_1, y_1, x_2, y_2) \| \leq \frac{\theta(a^{sn}x_1, b^{sn}y_1, a^{sn}x_2, b^{sn}y_2)}{|C|^{sn}}.
\]

Since the case \( n = 0 \) is just (25), fix an \( n \in \mathbb{N}_0 \) and assume that (33) holds for any \( x_1, x_2, y_1, y_2 \in X \). Then for any \( x_1, x_2, y_1, y_2 \in X \) we get

\[\| (\Phi(T^{n+1} f))(x_1, y_1, x_2, y_2) \|
\]

\[= \| (T(T^n f))(a_1 x_1 + a_2 x_2, b_1 y_1 + b_2 y_2) - C_1(T(T^n f))(x_1, y_1) - C_2(T(T^n f))(x_2, y_2) - C_3(T(T^n f))(x_2, y_1) - C_4(T(T^n f))(x_2, y_2) \|
\]

\[= \frac{1}{C} \left( T(T^n f)(a^s(a_1 x_1 + a_2 x_2), b^s(b_1 y_1 + b_2 y_2)) - C_1 \frac{1}{C} (T^n f)(a^s x_1, b^s y_1) - C_2 \frac{1}{C} (T^n f)(a^s x_2, b^s y_2) - C_3 \frac{1}{C} (T^n f)(a^s x_2, b^s y_1) - C_4 \frac{1}{C} (T^n f)(a^s x_2, b^s y_2) \right)
\]

\[= \frac{1}{|C|^{n}} \| (\Phi(T^n f))(a^s x_1, b^s y_1, a^s x_2, b^s y_2) \|
\]

\[\leq \frac{\theta(a^{s(n+1)}x_1, b^{s(n+1)}y_1, a^{s(n+1)}x_2, b^{s(n+1)}y_2)}{|C|^{s(n+1)}}
\]

and thus, (33) holds for any \( x_1, x_2, y_1, y_2 \in X \) and \( n \in \mathbb{N}_0. \)

Letting \( n \to \infty \) in (33) and using (27) we finally obtain

\[(\Phi F)(x_1, y_1, x_2, y_2) = 0, \quad x_1, x_2, y_1, y_2 \in X,
\]

which means that function \( F \) satisfies (1).

For the proof of uniqueness, assume that \( F' \) is another function satisfying (1) and (28). We have for all \( x, y \in X, \ l \in \mathbb{N}_0 \)

\[\| F(x, y) - F'(x, y) \|
\]

\[= \| \frac{1}{C} F(a^s x, b^s y) - \frac{1}{C} F'(a^s x, b^s y) \|
\]
\[
\begin{align*}
&\leq \frac{1}{|C|} \left(\|F(a^{sl}x, b^{sl}y) - f(a^{sl}x, b^{sl}y)\| \\
&+ \|F'(a^{sl}x, b^{sl}y) - f(a^{sl}x, b^{sl}y)\|\right) \\
&\leq 2 \sum_{n=0}^{\infty} \frac{\theta(a^{s(l+n)+\frac{x}{2}x, b^{s(l+n)+\frac{x}{2}y}, a^{s(l+n)+\frac{x}{2}x, b^{s(l+n)+\frac{x}{2}y}})}{|C|^{s(l+n)+\frac{y}{2}}} \\
&= 2 \sum_{n=-1}^{\infty} \frac{\theta(a^{sn+\frac{x}{2}x, b^{sn+\frac{x}{2}y}}, a^{sn+\frac{x}{2}x, b^{sn+\frac{x}{2}y}})}{|C|^{sn+\frac{y}{2}}},
\end{align*}
\]

whence letting \( l \to \infty \) and using (26) we obtain \( F(x, y) = F'(x, y) \) for all \( x, y \in X \), which finishes the proof.

\[\square\]

Theorem 3 with \( \theta(x_1, y_1, x_2, y_2) := \varepsilon > 0 \) gives immediately the classical Hyers–Ulam stability result for (1). Namely, we have the following corollary.

**Corollary 1.** Let \((Y, \|\cdot\|)\) be a Banach space, \( \varepsilon > 0, C \neq 0, |C| \neq 1, a \neq 0 \) and \( b \neq 0 \). If \( f: X^2 \to Y \) satisfies the inequality

\[
\| (\Phi f)(x_1, y_1, x_2, y_2) \| \leq \varepsilon, \quad x_1, x_2, y_1, y_2 \in X,
\]

then there exists a unique solution \( F: X^2 \to Y \) of (1) such that

\[
\| f(x, y) - F(x, y) \| \leq \frac{\varepsilon}{1 - |C|}, \quad x, y \in X.
\]

**Proof.** From (26) we have

\[
\varepsilon^*(x, y) = \begin{cases} 
\sum_{n=0}^{\infty} \frac{\varepsilon}{|C|^{n+1}}, & \text{for } |C| > 1 \\
\varepsilon \sum_{n=0}^{\infty} |C|^n \varepsilon, & \text{for } 0 < |C| < 1 \\
\frac{\varepsilon}{|C| - 1}, & \text{for } |C| > 1 \\
\frac{\varepsilon}{1 - |C|}, & \text{for } 0 < |C| < 1
\end{cases}
\]

\[
\varepsilon^* = \frac{\varepsilon}{|1 - |C||}, \quad \text{for } C \in \mathbb{R} \setminus \{-1, 1\}.
\]

\[\square\]

**Remark 3.** Studying the proof of Theorem 3 one can make several observations:

- We do not demand that the coefficients \( a_1, a_2, b_1, b_2 \) are non-zero.
- If \( C = 0 \) then for \( \varepsilon^* \) in (26) to be well defined we take \( s = -1 \). If also \( a \neq 0, b \neq 0 \), then in Theorem 3, \( f \) satisfies the condition

\[
\| f(x, y) \| \leq \theta \left( \frac{x}{a}, \frac{y}{b} \right), \quad x, y \in X,
\]

and in Corollary 1, \( f \) is bounded by \( \varepsilon \). Both, in the theorem and in the corollary, we have then

\[
F(x, y) = \lim_{n \to \infty} (T^n f)(x, y) = \lim_{n \to \infty} C^n f \left( \frac{x}{a^n}, \frac{y}{b^n} \right) = 0, \quad x, y \in X.
\]
• If \( a = 0 = b \) (and \( |C| > 1 \), for (26) to be satisfied), we take \( s = 1 \), and we have
\[
\left\| f(x, y) - \frac{f(0,0)}{C} \right\| \leq \frac{1}{|C|} \theta(x, y, x, y), \quad x, y \in X,
\]
(34) in Theorem 3, and with \( \theta(x, y, x, y) = \varepsilon \), in Corollary 1.
Then
\[
F(x, y) = \lim_{n \to \infty} (T^n f)(x, y) = \lim_{n \to \infty} \frac{1}{C^n} f(0,0) = 0.
\]
From (34), it follows that in Theorem 3, \( f \) is majorized by the function
\[
X^2 \ni (x, y) \mapsto \frac{1}{|C|} \theta(x, y, x, y) + \frac{\theta(0,0,0,0)}{|C - 1||C|},
\]
and in Corollary 1, it is simply bounded.

• If \( a = 0 \) and \( b \neq 0 \) (and \( |C| > 1 \)) then \( s = 1 \) and the approximating function \( F \) depends only on one variable
\[
F(x, y) = \lim_{n \to \infty} (T^n f)(x, y) = \lim_{n \to \infty} \frac{1}{C^n} f(0, b^n y), \quad x, y \in X.
\]
Analogous approach we have for \( a \neq 0 \) and \( b = 0 \).

• If \( |C| > 1 \) then \( s = 1 \), and Corollary 1 coincides with the result of Ciepliński from [10].

**Theorem 4.** Let \( (Y, \| \cdot \|) \) be a Banach space. Assume that \( f : X^2 \to Y \) and \( \theta : X^4 \to \mathbb{R}_+ \) are mappings satisfying inequality (25) and the conditions
\[
\varepsilon^*(x, y) := \sum_{n=0}^{\infty} \sum_{i+j+k+l=n} \binom{n}{i,j,k,l} |C_1|^i |C_2|^j |C_3|^k |C_4|^l \delta^{(i,j,k,l)}(x, y, x, y) < \infty, \tag{35}
\]
for \( x, y \in X \) and
\[
\lim_{n \to \infty} \sum_{i+j+k+l=n} \binom{n}{i,j,k,l} |C_1|^i |C_2|^j |C_3|^k |C_4|^l \delta^{(i,j,k,l)}_0(x_1, y_1, x_2, y_2) = 0, \tag{36}
\]
for \( x_1, x_2, y_1, y_2 \in X \), where
\[
\delta^{(i,j,k,l)}_m(x_1, y_1, x_2, y_2) := \theta \left( \frac{x_1}{(2a_1)^{i+j+m}(2a_2)^{k+l}}, \frac{y_1}{(2b_1)^{i+k+m}(2b_2)^{j+l}}; \frac{x_2}{(2a_1)^{i+j+m}(2a_2)^{k+l+m}}, \frac{y_2}{(2b_1)^{i+k+m}(2b_2)^{j+l+m}} \right).
\]
Then there exists a unique solution \( F : X^2 \to Y \) of (1) such that condition (28) holds.

**Proof.** Putting \( x_1 = \frac{x}{2a_1}, \ x_2 = \frac{x}{2a_2}, \ y_1 = \frac{y}{2b_1} \) and \( y_2 = \frac{y}{2b_2} \) in (25) (with \( x, y \in X \)) we get
\[
\left\| f(x, y) - C_1 f\left( \frac{x}{2a_1}, \frac{y}{2b_1} \right) - C_2 f\left( \frac{x}{2a_1}, \frac{y}{2b_2} \right) \right\|.
\]
\[-C_3 f \left( \frac{x}{2a_1}, \frac{y}{2b_1} \right) - C_4 f \left( \frac{x}{2a_1}, \frac{y}{2b_1} \right) \| \leq \theta \left( \frac{x}{2a_1}, \frac{y}{2b_1}, \frac{x}{2a_2}, \frac{y}{2b_2} \right), \quad x, y \in X. \quad (37)\]

Define

\[(T \xi)(x, y) := C_1 \xi \left( \frac{x}{2a_1}, \frac{y}{2b_1} \right) + C_2 \xi \left( \frac{x}{2a_1}, \frac{y}{2b_1} \right) + C_3 \xi \left( \frac{x}{2a_2}, \frac{y}{2b_1} \right) + C_4 \xi \left( \frac{x}{2a_2}, \frac{y}{2b_2} \right), \quad \xi \in Y^X, \quad x, y \in X,\]

and

\[\varepsilon(x, y) := \theta \left( \frac{x}{2a_1}, \frac{y}{2b_1}, \frac{x}{2a_2}, \frac{y}{2b_2} \right), \quad x, y \in X.\]

Then, by (37), we obtain

\[\| (T f)(x, y) - f(x, y) \| \leq \varepsilon(x, y), \quad x, y \in X.\]

Put also

\[(\Lambda \eta)(x, y) := |C_1| \eta \left( \frac{x}{2a_1}, \frac{y}{2b_1} \right) + |C_2| \eta \left( \frac{x}{2a_1}, \frac{y}{2b_1} \right) + |C_3| \eta \left( \frac{x}{2a_2}, \frac{y}{2b_1} \right) + |C_4| \eta \left( \frac{x}{2a_2}, \frac{y}{2b_2} \right), \quad \eta \in \mathbb{R}^X, \quad x, y \in X.\]

Now, using induction, we show that for any \( n \in \mathbb{N}_0 \) and \( x, y \in X \) we have

\[(\Lambda^n \varepsilon)(x, y) = \sum_{i+j+k+l=n} \binom{n}{i, j, k, l} |C_1|^i |C_2|^j |C_3|^k |C_4|^l \times \varepsilon \left( \frac{1}{2a_1}, i, j, k, l \right) \left( \frac{1}{2a_2}, \frac{y}{2b_1} \right) \left( \frac{1}{2b_2} \right) \left( \frac{x}{2a_1}, \frac{y}{2b_1} \right) \left( \frac{x}{2a_2}, \frac{y}{2b_2} \right). \quad (38)\]

Fix \( x, y \in X \). Clearly, (38) is true for \( n = 0 \). Next, fix an \( n \in \mathbb{N}_0 \) and assume that (38) holds. Then

\[(\Lambda^{n+1} \varepsilon)(x, y) = (\Lambda (\Lambda^n \varepsilon))(x, y) = |C_1| (\Lambda^n \varepsilon) \left( \frac{x}{2a_1}, \frac{y}{2b_1} \right) + |C_2| (\Lambda^n \varepsilon) \left( \frac{x}{2a_1}, \frac{y}{2b_1} \right) + |C_3| (\Lambda^n \varepsilon) \left( \frac{x}{2a_2}, \frac{y}{2b_1} \right) + |C_4| (\Lambda^n \varepsilon) \left( \frac{x}{2a_2}, \frac{y}{2b_2} \right) = \sum_{i+j+k+l=n} \binom{n}{i, j, k, l} |C_1|^{i+1} |C_2|^j |C_3|^k |C_4|^l \times \varepsilon \left( \frac{1}{2a_1}, \frac{x}{2a_1}, \frac{y}{2b_1}, \frac{x}{2a_2}, \frac{y}{2b_1}, \frac{x}{2a_2}, \frac{y}{2b_2} \right) + \sum_{i+j+k+l=n} \binom{n}{i, j, k, l} |C_1|^i |C_2|^{j+1} |C_3|^k |C_4|^l \]
a unique fixed point \( R \) and thus (38) is true for any given by (32).

Since the case \( n \) satisfies the assumptions of Theorem 1 in \([8]\) and therefore there exists a unique fixed point \( F: X^2 \to Y \) of \( T \) such that (28) holds. Moreover, \( F \) is given by (32).

We prove that for any \( x_1, x_2, y_1, y_2 \in X \) and \( n \in \mathbb{N}_0 \) we have

\[
\|(\Phi(T^n f))(x_1, y_1, x_2, y_2)\| \leq \sum_{i+j+k+l=n} \binom{n}{i,j,k,l} |C_1|^i |C_2|^j |C_3|^k |C_4|^l \delta_0^{(i,j,k,l)}(x_1, y_1, x_2, y_2). \tag{39}
\]

Since the case \( n = 0 \) is just (25), fix an \( n \in \mathbb{N}_0 \) and assume that (39) holds for any \( x_1, x_2, y_1, y_2 \in X \). Then for any \( x_1, x_2, y_1, y_2 \in X \) we get

\[
\|(\Phi(T^{n+1} f))(x_1, y_1, x_2, y_2)\| = \|(T(T^n f))(a_1 x_1 + a_2 x_2, b_1 y_1 + b_2 y_2) - C_1(T(T^n f))(x_1, y_1) - C_2(T(T^n f))(x_1, y_2) - C_3(T(T^n f))(x_2, y_1) - C_4(T(T^n f))(x_2, y_2)\|
\]

\[
= \|C_1(T^n f)\left(\frac{a_1 x_1 + a_2 x_2}{2a_1}, \frac{b_1 y_1 + b_2 y_2}{2b_1}\right)
+ C_2(T^n f)\left(\frac{a_1 x_1 + a_2 x_2}{2a_1}, \frac{b_1 y_1 + b_2 y_2}{2b_2}\right)
+ C_3(T^n f)\left(\frac{a_1 x_1 + a_2 x_2}{2a_2}, \frac{b_1 y_1 + b_2 y_2}{2b_1}\right)
+ C_4(T^n f)\left(\frac{a_1 x_1 + a_2 x_2}{2a_2}, \frac{b_1 y_1 + b_2 y_2}{2b_2}\right)\|
\]
\[-C_1 \left( C_1(T^n f) \left( \frac{x_1}{2a_1}, \frac{y_1}{2b_1} \right) + C_2(T^n f) \left( \frac{x_1}{2a_1}, \frac{y_1}{2b_2} \right) \right) + C_3(T^n f) \left( \frac{x_1}{2a_2}, \frac{y_1}{2b_1} \right) + C_4(T^n f) \left( \frac{x_1}{2a_2}, \frac{y_1}{2b_2} \right) \]
\[+ C_2 \left( C_1(T^n f) \left( \frac{x_1}{2a_1}, \frac{y_2}{2b_1} \right) + C_2(T^n f) \left( \frac{x_1}{2a_1}, \frac{y_2}{2b_2} \right) \right) + C_3(T^n f) \left( \frac{x_1}{2a_2}, \frac{y_2}{2b_1} \right) + C_4(T^n f) \left( \frac{x_1}{2a_2}, \frac{y_2}{2b_2} \right) \]
\[+ C_3 \left( C_1(T^n f) \left( \frac{x_2}{2a_1}, \frac{y_1}{2b_1} \right) + C_2(T^n f) \left( \frac{x_2}{2a_1}, \frac{y_1}{2b_2} \right) \right) + C_3(T^n f) \left( \frac{x_2}{2a_2}, \frac{y_1}{2b_1} \right) + C_4(T^n f) \left( \frac{x_2}{2a_2}, \frac{y_1}{2b_2} \right) \]
\[+ C_3 \left( C_1(T^n f) \left( \frac{x_2}{2a_1}, \frac{y_2}{2b_1} \right) + C_2(T^n f) \left( \frac{x_2}{2a_1}, \frac{y_2}{2b_2} \right) \right) + C_3(T^n f) \left( \frac{x_2}{2a_2}, \frac{y_2}{2b_1} \right) + C_4(T^n f) \left( \frac{x_2}{2a_2}, \frac{y_2}{2b_2} \right) \]
\[\leq |C_1| \left\| \left( \frac{x_1}{2a_1}, \frac{y_1}{2b_1}, \frac{x_2}{2a_1}, \frac{y_2}{2b_1} \right) \right\| \]
\[+ |C_2| \left\| \left( \frac{x_1}{2a_1}, \frac{y_1}{2b_2}, \frac{x_2}{2a_1}, \frac{y_2}{2b_2} \right) \right\| \]
\[+ |C_3| \left\| \left( \frac{x_1}{2a_2}, \frac{y_1}{2b_1}, \frac{x_2}{2a_2}, \frac{y_2}{2b_1} \right) \right\| \]
\[+ |C_4| \left\| \left( \frac{x_1}{2a_2}, \frac{y_1}{2b_2}, \frac{x_2}{2a_2}, \frac{y_2}{2b_2} \right) \right\| \]
\[\leq \sum_{i+j+k+l=n} \left( \frac{n}{i, j, k, l} \right) |C_1|^{i+1} |C_2|^j |C_3|^k |C_4|^l \]
\[\times \delta_0^{(i,j,k,l)} \left( \frac{x_1}{2a_1}, \frac{y_1}{2b_1}, \frac{x_2}{2a_1}, \frac{y_2}{2b_1} \right) \]
\[+ \sum_{i+j+k+l=n} \left( \frac{n}{i, j, k, l} \right) |C_1|^i |C_2|^{j+1} |C_3|^k |C_4|^l \]
\[\times \delta_0^{(i,j,k,l)} \left( \frac{x_1}{2a_1}, \frac{y_1}{2b_2}, \frac{x_2}{2a_1}, \frac{y_2}{2b_1} \right) \]
\[+ \sum_{i+j+k+l=n} \left( \frac{n}{i, j, k, l} \right) |C_1|^i |C_2|^j |C_3|^{k+1} |C_4|^l \]
\[\times \delta_0^{(i,j,k,l)} \left( \frac{x_1}{2a_2}, \frac{y_1}{2b_1}, \frac{x_2}{2a_2}, \frac{y_2}{2b_1} \right) \]
\[+ \sum_{i+j+k+l=n} \left( \frac{n}{i, j, k, l} \right) |C_1|^i |C_2|^j |C_3|^k |C_4|^{l+1} \]
\[\times \delta_0^{(i,j,k,l)} \left( \frac{x_1}{2a_2}, \frac{y_1}{2b_2}, \frac{x_2}{2a_2}, \frac{y_2}{2b_2} \right) \]
\[
\begin{align*}
&= \sum_{i+j+k+l=n+1} \binom{n+1}{i,j,k,l} |C_1|^i |C_2|^j |C_3|^k |C_4|^l \delta^{(i,j,k,l)}_0 (x_1, y_1, x_2, y_2).
\end{align*}
\]

We have thus shown that (39) holds for \( x_1, x_2, y_1, y_2 \in X \) and \( n \in \mathbb{N}_0 \). Letting \( n \to \infty \) in (39) and using (36) we see that

\[
(\Phi F)(x_1, y_1, x_2, y_2) = 0, \quad x_1, x_2, y_1, y_2 \in X,
\]

which means that function \( F \) satisfies (1).

For the proof of uniqueness, assume that \( F' \) is another function satisfying (1) and (28). Then, for any \( m \in \mathbb{N} \) we have

\[
\|F(x, y) - F'(x, y)\|
\]

\[
= \left\| \sum_{i+j+k+l=m} \binom{m}{i,j,k,l} C_1^i C_2^j C_3^k C_4^l 
\times \left[ F \left( \frac{x}{(2a_1)^{i+j}(2a_2)^k+l}, \frac{y}{(2b_1)^{i+k}(2b_2)^j+l} \right) 
- F' \left( \frac{x}{(2a_1)^{i+j}(2a_2)^k+l}, \frac{y}{(2b_1)^{i+k}(2b_2)^j+l} \right) \right]\right\|
\]

\[
\leq \sum_{i+j+k+l=m} \binom{m}{i,j,k,l} |C_1|^i |C_2|^j |C_3|^k |C_4|^l
\times \left( \left[ \left| F \left( \frac{x}{(2a_1)^{i+j}(2a_2)^k+l}, \frac{y}{(2b_1)^{i+k}(2b_2)^j+l} \right) 
- f \left( \frac{x}{(2a_1)^{i+j}(2a_2)^k+l}, \frac{y}{(2b_1)^{i+k}(2b_2)^j+l} \right) \right| 
+ \left| f \left( \frac{x}{(2a_1)^{i+j}(2a_2)^k+l}, \frac{y}{(2b_1)^{i+k}(2b_2)^j+l} \right) \right| \right)
\right)^n
\]

\[
= 2 \sum_{n=0}^{\infty} \sum_{i+j+k+l+m, i+j+k+l+n} \binom{m}{i,j,k,l} \binom{n}{\tilde{i}, \tilde{j}, \tilde{k}, \tilde{l}} |C_1|^{i+\tilde{i}} |C_2|^{j+\tilde{j}} |C_3|^{k+\tilde{k}} |C_4|^{l+\tilde{l}}
\times \theta \left( \frac{x}{(2a_1)^{i+\tilde{i}+j+\tilde{j}+1}(2a_2)^{k+\tilde{k}+l+\tilde{l}}}, \frac{y}{(2b_1)^{i+\tilde{i}+k+\tilde{k}+1}(2b_2)^{j+\tilde{j}+l+\tilde{l}}} \right)
\times \left( \frac{x}{(2a_1)^{i+\tilde{i}+j+\tilde{j}+1}(2a_2)^{k+\tilde{k}+l+\tilde{l}}}, \frac{y}{(2b_1)^{i+\tilde{i}+k+\tilde{k}+1}(2b_2)^{j+\tilde{j}+l+\tilde{l}}} \right).
\]
\[ 2 \sum_{n=0}^{\infty} \sum_{i+j+k+l=n+m} \left( \frac{n+m}{i, j, k, l} \right) |C_1|^i |C_2|^j |C_3|^k |C_4|^l \times \theta \left( \frac{x}{(2a_1)^{i+j+1} (2a_2)^{k+l}}, \frac{y}{(2b_1)^{i+k+1} (2b_2)^{j+l}} \right) \]

\[ = 2 \sum_{n=m}^{\infty} \sum_{i+j+k+l=n} \left( \frac{n}{i, j, k, l} \right) |C_1|^i |C_2|^j |C_3|^k |C_4|^l \times \theta \left( \frac{x}{(2a_1)^{i+j+1} (2a_2)^{k+l}}, \frac{y}{(2b_1)^{i+k+1} (2b_2)^{j+l}} \right) \]

Tending now with \( m \) to infinity, on the account of the assumption, it follows that \( F = F' \), which completes the proof. \( \square \)

Theorem 4 with \( \theta(x_1, y_1, x_2, y_2) := \varepsilon > 0 \) gives immediately the following corollary on the classical Hyers–Ulam stability of (1).

**Corollary 2.** Let \((Y, \| \cdot \|)\) be a Banach space, \( \varepsilon > 0 \) and \( |C_1| + |C_2| + |C_3| + |C_4| < 1 \). If \( f : X^2 \to Y \) satisfies the inequality

\[ \|(\Phi f)(x_1, y_1, x_2, y_2)\| \leq \varepsilon, \quad x_1, x_2, y_1, y_2 \in X, \]

then there exists a solution \( F : X^2 \to Y \) of (1) such that

\[ \|f(x, y) - F(x, y)\| \leq \frac{\varepsilon}{1 - (|C_1| + |C_2| + |C_3| + |C_4|)}, \quad x, y \in X. \]
