Abstract: In this paper we shall study a neutral differential equation with deviated argument in an arbitrary Banach space $X$. With the help of the analytic semigroups theory and fixed point method we establish the existence and uniqueness of solutions of the given problem. Finally, we give examples to illustrate the applications of the abstract results.

Keywords: Neutral differential equation with deviated argument, Banach fixed point theorem, Analytic semigroup.

AMS Subject Classification: 34K30, 34G20, 47H06.

1 Introduction

We consider the following neutral differential equation with deviated argument in a Banach space $X$:

$$
\begin{align*}
\frac{d}{dt}[u(t) + g(t, u(a(t)))] + A[u(t) + g(t, u(a(t)))] &= f(t, u(t), u[h(u(t), t)]), \\
u(0) &= u_0,
\end{align*}
$$

(1.1)

where $-A$ is the infinitesimal generators of an analytic semigroup. $f$, $g$, $h$ and $a$ are suitably defined functions satisfying certain conditions to be specified later.
Initial results related to the differential equations with deviated arguments can be found in some research papers of the last decade but still a complete theory seems to be missing. For the initial works on existence, uniqueness and stability of various types of solutions of different kind of differential equations, we refer to [1]-[10] and the references cited in these papers.

Adimy et al [11] have studied the existence and stability of solutions of the following general class of nonlinear partial neutral functional differential equations:

\[
\frac{d}{dt}(u(t) - g(t, u_t)) = A(u(t) - g(t, u_t)) + f(t, u_t), \quad t \geq 0, \\
u_0 = \varphi \in C_0,
\]

(1.2)

where the operator \(A\) is the Hille-Yosida operator not necessarily densely defined on the Banach space \(B\). The functions \(g\) and \(f\) are continuous from \([0, \infty) \times C_0\) into \(B\).

In this paper, we use the Banach fixed point theorem and analytic semigroup theory to prove existence and uniqueness of different kind of solutions to the given problem (1.1). The plan of the paper is as follows. In Section 3, we prove the existence and uniqueness of local solutions and in Section 4, the existence of global solution for the problem (1.1) is given. In the last section, we have given an example.

The results presented in this paper easily can be apply to the same problem (1.1) with nonlocal condition under some modified assumptions on the function \(f\) and operator \(A\).

2 Preliminaries and Assumptions

We note that if \(-A\) is the infinitesimal generator of an analytic semigroup then for \(c > 0\) large enough, \(-(A + cI)\) is invertible and generates a bounded analytic semigroup. This allows us to reduce the general case in which \(-A\) is the infinitesimal generator of an analytic semigroup to the case in which the semigroup is bounded and the generator is invertible. Hence without loss of generality we suppose that

\[\|S(t)\| \leq M \quad \text{for} \quad t \geq 0\]

and

\[0 \in \rho(-A),\]

where \(\rho(-A)\) is the resolvent set of \(-A\). It follows that for \(0 \leq \alpha \leq 1\), \(A^\alpha\) can be defined as a closed linear invertible operator with domain \(D(A^\alpha)\) being dense in \(X\). We have \(X_\alpha \hookrightarrow X_\kappa\) for \(0 < \alpha < \kappa\) and the embedding is continuous. For more details on the fractional powers of closed linear operators we refer to Pazy [11]. It can be proved easily that \(X_\alpha := D(A^\alpha)\) is a Banach space with norm \(\|x\|_\alpha = \|A^\alpha x\|\) and it is equivalent to the graph norm of \(A^\alpha\). Also, for each \(\alpha > 0\), we define \(X_{-\alpha} = (X_\alpha)^*\), the dual space of \(X_\alpha\) is a Banach space endowed with the norm \(\|x\|_{-\alpha} = \|A^{-\alpha}x\|\).

It can be seen easily that \(C_\alpha^t = C([0, t]; X_\alpha)\), for all \(t \in [0, T]\), is a Banach space endowed with the supremum norm,

\[\|\psi\|_{t, \alpha} := \sup_{0 \leq \eta \leq t} \|\psi(\eta)\|_\alpha, \quad \psi \in C_\alpha^t.\]
We set,

\[ C_{\alpha}^{-1} = C([0, T]; X_{\alpha-1}) = \{ y \in C_{\alpha}^T : \|y(t) - y(s)\|_{\alpha-1} \leq L|t - s|, \forall \ t, s \in [0, T] \}, \]

where \( L \) is a suitable positive constant to be specified later and \( 0 \leq \alpha < 1 \).

We assume the following conditions:

(A1): \( 0 \in \rho(-A) \) and \(-A\) is the infinitesimal generator of an analytic semigroup \( \{S(t) : t \geq 0\} \).

(A2): Let \( U_1 \subset \text{Dom}(f) \) be an open subset of \( \mathbb{R}_+ \times X_{\alpha} \times X_{\alpha-1} \) and for each \( (t, u, v) \in U_1 \) there is a neighborhood \( V_1 \subset U_1 \) of \((t, u, v)\). The nonlinear map \( f : \mathbb{R}_+ \times X_{\alpha} \times X_{\alpha-1} \to X \) satisfies the following condition,

\[ \|f(t, x, \psi) - f(s, y, \tilde{\psi})\| \leq L_f|t - s|^\theta + \|x - y\|_{\alpha} + \|\psi - \tilde{\psi}\|_{\alpha-1}, \]

where \( 0 < \theta_1 \leq 1, 0 \leq \alpha < 1, L_f > 0 \) is a positive constant, \((t, x, \psi) \in V_1\), and \((s, y, \tilde{\psi}) \in V_1\).

(A3): Let \( U_2 \subset \text{Dom}(h) \) be an open subset of \( X_{\alpha} \times \mathbb{R}_+ \) and for each \((x, t) \in U_2\) there is a neighborhood \( V_2 \subset U_2 \) of \((x, t)\). The map \( h : X_{\alpha} \times \mathbb{R}_+ \to \mathbb{R}_+ \) satisfies the following condition,

\[ |h(x, t) - h(y, s)| \leq L_h\|[x - y]_\alpha + |t - s|^{\theta_2}, \]

where \( 0 < \theta_2 \leq 1, 0 \leq \alpha < 1, L_h > 0 \) is a positive constant, \((x, t), (y, s) \in V_2\) and \( h(., 0) = 0 \).

(A4): Let \( U_3 \subset \text{Dom}(g) \) be an open subset of \([0, T] \times X_{\alpha-1}\) and for each \((t, x) \in U_3\) there is a neighborhood \( V_3 \subset U_3 \) of \((x, t)\). The function \( g : [0, T] \times X_{\alpha-1} \to X_{\alpha} \) is continuous for \((t, u) \in [0, T] \times X_{\alpha-1}\) such that

\[ \|A^\alpha g(t, x) - A^\alpha g(s, y)\| \leq L_g\{|t - s| + \|x - y\|_{\alpha-1}\}, \]

where \( 0 \leq \alpha < 1, L_g > 0 \) is a positive constant and \((x, t), (y, s) \in V_3\).

(A5): The function \( a : [0, T] \to [0, T] \) satisfies the following two conditions:

(i) \( a \) satisfies the delay property \( a(t) \leq t \) for all \( t \in [0, T] \);

(ii) The function \( a \) is Lipschitz continuous; that is, there exist a positive constant \( L_a \) such that

\[ |a(t) - a(s)| \leq L_a|t - s|, \text{ for all } t, s \in [0, T] \quad \text{and} \quad 1 > \|A^{-1}\|L_a. \]
Definition 2.1 A continuous function $u \in C_{[0,T]}^{\alpha-1} \cap C_T^\alpha$ is said to be a mild solution of equation (1.1) if $u$ is the solution of the following integral equation
\[
    u(t) = S(t)[u(0) + g(0, u_0)] - g(t, u(a(t))) + \int_0^t S(t-s)f(s, u(s), u[h(u(s), s)])ds, \quad t \in [0, T]
\] (2.1)
and satisfies the initial condition $u(0) = u_0$.

Definition 2.2 By a solution of the problem (1.1), we mean a function $u : [0, T] \rightarrow X_\alpha$ satisfying the following four conditions:

(i) $u(.) + g(. , u(a(. ))) \in C_{[0,T]}^{\alpha-1} \cap C^1((0,T), X) \cap C([0,T], X)$,
(ii) $u(t) \in D(A)$ and $(t, u(t), u[h(u(t), t)]) \in U_1$,
(iii) $\frac{d}{dt}[u(t) + g(t, u(a(t)))] + A[u(t) + g(t, u(a(t)))] = f(t, u(t), u[h(u(t), t)])$ for all $t \in (0, T]$,
(iv) $u(0) = u_0$.

3 Existence of Local Solutions

We can prove that assumptions (A2)-(A3), for $0 \leq \alpha < 1, 0 < T_0 \leq T$, and $u \in C_{[0,T]}^\alpha$ imply that $f(s, u(s), u[h(u(s), s)])$ is continuous on $[0, T_0]$. Therefore, we can show that there exists a positive constant $N$ such that
\[
    ||f(s, u(s), u[h(u(s), s)])|| \leq N = L_f[T_0^{\theta_1} + \delta(1 + LL_h) + L_LT_0^{\theta_2}] + N_0,
\]
where $N_0 = ||f(0, u_0, u_0)||$. Similarly with the help of the assumptions (A4)-(A5), we can show easily that $||A^{\alpha}g(t, u(a(t)))|| \leq L_g[T_0 + \delta] + ||g(0, u_0)||_\alpha = N_1$. Also, we denote $||A^{-1}|| = M_2$ and $||A^{-\alpha}|| = M_3$.

Theorem 3.1 Let us assume that the assumptions (A1)-(A5) are hold and $u_0 \in D(A^\alpha)$ for $0 \leq \alpha < 1$. Then, the differential equation (1.1) has a unique local mild solution if
\[
    \left( L_g + C_\alpha L_f[2 + LL_h]T_0^{1-\alpha} \right) < 1. \tag{3.1}
\]

Proof. Now for a fixed $\delta > 0$, we choose $0 < T_0 \leq T$ such that
\[
    ||(S(t) - I)A^\alpha[u_0 + g(0, u_0)]|| + L_g[T_0 + \delta] \leq \frac{\delta}{2}, \quad \text{for all } t \in [0, T_0] \tag{3.2}
\]
and
\[
    C_\alpha N \frac{T_0^{1-\alpha}}{1-\alpha} \leq \frac{\delta}{2}. \tag{3.3}
\]

EJQTDE, 2008 No. 27, p. 4
We set
\[ W = \{ u \in C^\alpha_{T_0} \cap C^{\alpha-1}_{T_0} : u(0) = u_0, \| u - u_0 \|_{T_0, \alpha} \leq \delta \}. \]

Clearly, \( W \) is a closed and bounded subset of \( C^\alpha_{T} \).

We define a map \( \mathcal{F} : W \to W \) given by
\[
(\mathcal{F}u)(t) = S(t)[u_0 + g(0, u_0)] - g(t, u(a(t)))
+ \int_0^t S(t - s)f(s, u(s), u[h(u(s), s)])ds, \ t \in [0, T]. \tag{3.4}
\]

In order to prove this theorem first we need to show that \( \mathcal{F}u \in C^{\alpha-1}_{T_0} \) for any \( u \in C^\alpha_{T_0} \). Clearly, \( \mathcal{F} : C^\alpha_{T} \to C^\alpha_{T} \).

If \( u \in C^\alpha_{T_0} \), \( T > t_2 > t_1 > 0 \), and \( 0 \leq \alpha < 1 \), then we get
\[
\| (\mathcal{F}u)(t_2) - (\mathcal{F}u)(t_1) \|_{\alpha-1} \leq \| (S(t_2) - S(t_1))(u_0 + g(0, u_0)) \|_{\alpha-1}
+ \| A^{-1}\| A^\alpha g(t_2, u(a(t_2))) - A^\alpha g(t_1, u(a(t_1))) \|
+ \int_{t_1}^{t_2} \| (S(t_2 - s) - S(t_1 - s))A^{-1}\| f(s, u(s), u[h(u(s), s)])ds
+ \int_{t_1}^{t_2} \| S(t_2 - s)A^{-1}\| f(s, u(s), u[h(u(s), s)])ds. \tag{3.5}
\]

We have,
\[
\| (S(t_2) - S(t_1))(u_0 + g(0, u_0)) \|_{\alpha-1} \leq \int_{t_1}^{t_2} \| A^\alpha S'(s)(u_0 + g(0, u_0)) \| ds
= \int_{t_1}^{t_2} \| A^\alpha S(s)(u_0 + g(0, u_0)) \| ds
\leq \int_{t_1}^{t_2} \| S(s)\| \| u_0 \|_{\alpha} + \| g(0, u_0) \|_{\alpha} ds
\leq C_1(t_2 - t_1), \tag{3.6}
\]

where \( C_1 = \| u_0 \|_{\alpha} + \| g(0, u_0) \|_{\alpha} M. \)

Also, we can see that
\[
\| A^{-1}\| A^\alpha g(t_2, u(a(t_2))) - A^{-1}\| A^\alpha g(t_1, u(a(t_1))) \|
\leq \| A^{-1}\| \| A^\alpha g(t_2, u(a(t_2))) - A^\alpha g(t_1, u(a(t_1))) \|
\leq \| A^{-1}\| \| Lg[(t_2 - t_1) + \| u(a(t_2)) - u(a(t_1)) \|_{\alpha-1}] \|
\leq \| A^{-1}\| \| Lg + LL_\alpha \| (t_2 - t_1). \tag{3.7}
\]

We observe that,
\[
\| (S(t_2 - s) - S(t_1 - s)) \|_{\alpha-1} \leq \int_{0}^{t_2-t_1} \| A^\alpha S'(t)S(t_1 - s) \| dt
\]

EJQTDE, 2008 No. 27, p. 5
Now we use the inequality (3.8) to get the inequality given below,

\[
\int_0^{t_2-t_1} \|S(t)A^\alpha S(t_1 - s)\|dl \\
\leq M C_\alpha (t_2 - t_1) (t_1 - s)^{-\alpha}.
\]

(3.8)

Hence, from inequalities (3.2) and (3.3), we get

\[
F = \|C\|
\]

where

\[
C = \|A^\alpha\|_{\text{NMC}}.
\]

Similarly,

\[
\int_t^{t_2} \|S(t_2 - s)A^\alpha - 1\|f(s, u(s), u[h(u(s), s)])\|ds \leq C_2 (t_2 - t_1),
\]

(3.9)

where \(C_2 = NMC_\alpha T_2^{-\alpha}\).

Similarly,

\[
\int_t^{t_2} \|S(t_2 - s)A^\alpha - 1\|f(s, u(s), u[h(u(s), s)])\|ds \leq C_3 (t_2 - t_1),
\]

(3.10)

where \(C_3 = \|A^\alpha - 1\|_{\text{MN}}\).

We use the inequalities (3.6) (3.7) (3.9) and (3.10) in inequality (3.5) and get the following inequality,

\[
\|\|(F u)(t_2) - (F u)(t_1)\|_{\alpha - 1} \leq L |t_2 - t_1|,
\]

(3.11)

where, \(L = \frac{C_1 + C_2 + C_3 + \|A^\alpha - 1\|_{\text{L}_{\alpha}}}{1 - \|A^{-1}\|_{\text{L}_{\alpha}}} \). Hence, \(F : C_{T_0}^{\alpha - 1} \rightarrow C_{T_0}^{\alpha - 1} \).

Our next task is to show that \(F : W \rightarrow W \). Now, for \(t \in (0, T_0] \) and \(u \in W \), we have

\[
\|\|(F u)(t) - u_0\|_{\alpha} \leq \|(S(t) - I)A^\alpha [u_0 + g(0, u_0)]\| + \|A^\alpha g(s, u(a(s))) - A^\alpha g(0, u(a(0)))\| \\
+ \int_0^t \|S(t - s)A^\alpha \|f(s, u(s), u[h(u(s), s)])\|ds
\]

\[
\leq \|(S(t) - I)A^\alpha[u_0 + g(0, u_0)]\| + L_g[T_0 + \delta] + C_\alpha NT_0^{1-\alpha}.
\]

Hence, from inequalities (3.2) and (3.3), we get

\[
\|F u - u_0\|_{T_0, \alpha} \leq \delta.
\]

Therefore, \(F : W \rightarrow W \).

Now, if \(t \in (0, T_0] \) and \(u, v \in W \), then

\[
\|\|(F u)(t) - (F v)(t)\|_{\alpha} \leq \|A^\alpha g(t, u(a(t))) - A^\alpha g(t, v(a(t)))\| \\
+ \int_0^t \|S(t - s)A^\alpha \|f(s, u(s), u[h(u(s), s)]) - f(s, v(s), v[h(u(s), s)])\|ds.
\]

(3.12)
Hence, the mild solution $u$ from inequality (3.1), we get the following inequality given below.

We have the following inequalities, therefore, the map $F$ holds and Theorem 3.2.

Proof. Let us assume that the assumptions (A1)-(A5) are hold and $u(t)$ continuous on $(0, t > s > 0)$ and every $0 < h < 1$.

We use the inequalities (3.13) and (3.14) in the inequality (3.12) and get

$$\|(F^{-1}(t) - (F^{-1}(t))\| \leq \left( L_g\|A^{-1}\| + C_{\alpha}L_f\|2 + LL_h\|\frac{T^{1-\alpha}}{1-\alpha}\right) \|u - v\|_{T_0, \alpha}.$$  

Hence from inequality (3.1), we get the following inequality given below

$$\|F^{-1} - F^{-1}\|_{T_0, \alpha} < \|u - v\|_{T_0, \alpha}.$$  

Therefore, the map $F$ has a unique fixed point $u \in W$, which is given by,

$$u(t) = S(t)[u_0 + g(0, u_0) - g(t, u(a(t))) + \int_0^t S(t - s)f(s, u(s), u[h(u(s), s)])ds, \ t \in [0, T_0].$$  

Hence, the mild solution $u$ of equation (1.1) is given by the equation (3.16) and belong to $C_{T_0} \cap C^{\alpha-1}_{T_0}$.

**Theorem 3.2** Let us assume that the assumptions (A1)-(A5) are hold and $u_0 \in D(A^\alpha)$ for $0 \leq \alpha < 1$. Then, the differential equation (1.1) has a unique local solution in the sense of the Definition 2.2.

**Proof.** In order to prove this theorem, we first need to prove that the mild solution $u$ is Hölder continuous on $(0, T_0)$. From Theorem 2.6.13 in Pazy [11], it follows that for every $0 < \beta < 1 - \alpha$, $t > s > 0$ and every $0 < h < 1$, we have

$$\|(S(h) - I)A^\alpha S(t - s)\| \leq C_{\beta}h^\beta\|A^\alpha S(t - s)\| \leq Ch^\beta(t - s)^{(\alpha + \beta)},$$  

where $C = C_{\beta}C_{\alpha + \beta}$.

For $0 < t < t + h \leq T_0$, we have

$$\|u(t + h) - u(t)\| \leq \|(S(h) - I)S(t)[u_0 + g(0, u_0)]\| + \|A^\alpha g(t_2, u(a(t_2))) - A^\alpha g(t_1, u(a(t_1)))\| + \int_t^{t+h} \|(S(h) - I)A^\alpha S(t - s)\|\|f(s, u(s), u[h(u(s), s)])\|\|ds + \int_t^{t+h} \|S(t + h - s)A^\alpha\|\|f(s, u(s), u[h(u(s), s)])\|\|ds.$$  

EJQTDE, 2008 No. 27, p. 7
We calculate the first term of the above inequality (3.18) as follows:
\[
\| (S(h) - I)S(t)A^\alpha (u_0 + g(0, u_0)) \| \leq C t^{-(\alpha + \beta)} \{ \| u_0 \| + \| g(0, u_0) \| \} h^\beta \\
\leq M_1 h^\beta,
\]
where \( M_1 = C t^{-(\alpha + \beta)} \{ \| u_0 \| + \| g(0, u_0) \| \} \) depends on \( t \) and blows up as \( t \) decreases to zero.

Second term of the above inequality (3.18) we calculate as follows,
\[
\| A^\alpha g(t, u(a(t + h))) - A^\alpha g(t, u(a(t))) \| \\
\leq \| A^\alpha g(t, u(a(t + h))) - A^\alpha g(t, u(a(t))) \| \\
\leq L_g [h + \| A \| \| u(a(t + h)) - u(a(t)) \|_{\alpha - 1} ] \\
\leq L_g [h + \| A \| LL_a h] \\
\leq M_2 h,
\]
where \( M_2 = L_g [1 + \| A \| LL_a] \) is a constant independent of \( t \).

Third and the fourth term of the inequality (3.18) can be calculated as follows:
\[
\int_0^t \| (S(h) - I)A^\alpha S(t - s) \| \| f(s, u(s), u[h(u(s), s)]) \| ds \\
\leq C h^\beta N \int_0^t (t - s)^{-(\alpha + \beta)} ds \\
\leq M_3 h^\beta,
\]
\[
\int_t^{t + h} \| A^\alpha S(t + h - s) \| \| f(s, u(s), u[h(u(s), s)]) \| ds, \quad \leq C \alpha N \int_t^{t + h} (t + h - s)^{-\alpha} ds \\
\leq M_4 h^\beta,
\]
where \( M_3 \) and \( M_4 \) can be chosen to be independent of \( t \).

Therefore,
\[
\| u(t + h) - u(t) \| \leq C' h^\beta,
\]
where \( C' \) is a positive constant. Thus, \( u \) is locally Hölder continuous on \((0, T_0]\).

Hence,
\[
\| f(t, u(t), u[h(u(t), t)]) - f(s, u(s), u[h(u(s), s)]) \| \\
\leq L_f \{ |t - s|^{\theta_1} + \| u(t) - u(s) \|_{\alpha} + L h(u(t), t) - h(u(s), s) \} \\
\leq L_f \{ |t - s|^{\theta_1} + \| u(t) - u(s) \|_{\alpha} + LL_h [t - s]^{\theta_2} + \| u(t) - u(s) \|_{\alpha} \} \\
\leq L_f \{ |t - s|^{\theta_1} + C' |t - s|^{\beta} + LL_h [t - s]^{\theta_2} + C' |t - s|^{\beta} \}.
\]
Hence, the map \( t \mapsto f(t, u(t), u[h(u(t), t)]) \) is locally Hölder continuous. Therefore,
\[
f(t, u(t), u[h(u(t), t)]) \in C([0, T], X) \cap C^{\beta'}((0, T], X),
\]
where \( 0 < \beta' < \min \{ \theta_1, \beta, \theta_2 \} \). Similarly, we can prove that \( u(\cdot) + g(\cdot, u(\cdot)) \) is also Hölder continuous on \((0, T_0]\). Therefore from Theorem 3.1 pp. 110 and Corollary 3.3, pp. 113, Pazy [11], the function \( u(\cdot) + g(\cdot, u(\cdot)) \in C^{\alpha_2 - 1}_T \cap C^1((0, T_0], X) \) \( \cap C([0, T_0], X) \) and \( u(\cdot) \) is the unique solution of the problem (1.1) in the sense of Definition 2.2. This completes the proof of the Theorem. 

EJQTDE, 2008 No. 27, p. 8
4 Existence of Global Solutions

Theorem 4.1 Suppose that \( 0 \in \rho(-A) \) and the operator \(-A\) generates the analytic semigroup \( S(t) \) with \( \|S(t)\| \leq M, \) for \( t \geq 0, \) the conditions \((A1)-(A4)\) are satisfied and \( u_0 \in D(A^{\alpha}). \) If there are continuous nondecreasing real valued function \( k_1(t), \) \( k_2(t) \) and \( k_3(t) \) such that

\[
\|f(t,x,y)\| \leq k_1(t)(1 + \|x\|_\alpha + \|y\|_{\alpha-1}), \quad \text{for all } t \geq 0, \quad x \in X_\alpha, \; y \in X_{\alpha-1}, \quad (4.1)
\]
\[
|h(z,t)| \leq k_2(t)(1 + \|z\|_\alpha), \quad \text{for all } t \geq 0, \quad z \in X_\alpha, \quad (4.2)
\]
\[
\|g(t,v)\| \leq k_3(t)(1 + \|v\|_{\alpha-1}), \quad \text{for all } t \geq 0, \quad v \in X_{\alpha-1}, \quad (4.3)
\]

then the initial value problem \((1.1)\) has a unique solution which exists for all \( t \in [0,T]. \)

Proof: By theorem \((3.1)\) we can continue the solution of equation \((1.1)\) as long as \( u \) is bounded. It is therefore sufficient to show that if \( u \) exists on \([0,T]\) then \( \|u(t)\|_\alpha \) is bounded as \( t \uparrow T. \)

We have the following inequality,

\[
\|u[h(u(s),s)]\|_{\alpha-1} \leq \|u[h(u(s),s)] - u(0)\|_{\alpha-1} + \|u_0\|_{\alpha-1}
\]

\[
\leq M[\|u_0\|_\alpha + k_3(T)\{1 + \|u_0\|_\alpha\}] + k_3(T)[1 + A^{-1}\|u\|_{t,\alpha}]
\]

\[
+ C_\alpha \int_0^t (t-s)^{-\alpha}k_1(T)[1 + \|u\|_{s,\alpha} + \|u[h(u(s),s)]\|_{\alpha-1}] ds,
\]

\[
\leq M[\|u_0\|_\alpha + k_3(T)\{1 + \|u_0\|_\alpha\}] + k_3(T) + k_3(T)\|A^{-1}\|u\|_{t,\alpha}
\]

\[
+ k_1(T)C_\alpha \int_0^t (t-s)^{-\alpha} ds + k_1(T)C_\alpha \int_0^t (t-s)^{-\alpha} \|u\|_{s,\alpha} ds
\]

\[
+ Lk_2(T)k_1(T)C_\alpha \int_0^t (t-s)^{-\alpha} ds + \|u_0\|_{\alpha-1}Lk_2(T)k_1(T)C_\alpha \int_0^t (t-s)^{-\alpha} ds
\]

\[
+ Lk_2(T)k_1(T)C_\alpha \int_0^t (t-s)^{-\alpha} \|u\|_{s,\alpha} ds,
\]

Hence,

\[
\|u\|_{t,\alpha} \leq C_1 + C_2 \int_0^t (t-s)^{-\alpha} \|u\|_{s,\alpha} ds,
\]

where \( C_1 = \frac{M}{1-k_3(T)}[\|u_0\|_\alpha + k_3(T)\{1 + \|u_0\|_\alpha\}] + \frac{k_3(T)}{1-k_3(T)} + \frac{k_3(T)C_\alpha T^{-\alpha}}{(1-k_3(T))(1-\alpha)} + \frac{Lk_2(T)k_1(T)C_\alpha T^{-\alpha}}{(1-k_3(T))(1-\alpha)} \)

\[
+ \|u_0\|_{\alpha-1} \frac{Lk_2(T)k_1(T)C_\alpha T^{-\alpha}}{(1-k_3(T))(1-\alpha)} \) and \( C_2 = \frac{k_1(T)C_\alpha T^{-\alpha}}{1-k_3(T)}. \) Hence by applying the Gronwall’s lemma to the above inequality \((4.5)\), we get the required results. This completes the proof of the theorem.

\( \square \)

5 Examples

Let \( X = L^2(0, 1) \). We consider the following partial differential equations with deviated argument,\
\[
\begin{aligned}
\partial_t [w(t, x) + \partial_x f_1(t, w(a(t), x))] - \partial_x^2 [w(t, x) + f_1(t, w(a(t), x))] \\
= f_2(x, w(t, x)) + f_3(t, x, w(t, x)), \quad x \in (0, 1), \quad t > 0,
\end{aligned}
\]
\[
\begin{aligned}
w(t, 0) = w(t, 1) = 0, \quad t \in [0, T], \quad 0 < T < \infty, \\
w(0, x) = u_0, \quad x \in (0, 1),
\end{aligned}
\]
where
\[
f_2(x, w(t, x)) = \int_0^x K(x, s)w(s, h(t)(a_1|w(s, t)| + b_1|w_x(s, t)|))ds.
\]

The function \( f_3 : \mathbb{R}_+ \times [0, 1] \times \mathbb{R} \to \mathbb{R} \) is measurable in \( x \), locally H"older continuous in \( t \), locally Lipschitz continuous in \( w \) and uniformly in \( x \). Further we assume that \( a_1, b_1 \geq 0, (a_1, b_1) \neq (0, 0) \), \( h : \mathbb{R}_+ \to \mathbb{R}_+ \) is locally H"older continuous in \( t \) with \( h(0) = 0 \) and \( K : [0, 1] \times [0, 1] \to \mathbb{R} \). The function \( f_1 : \mathbb{R}_+ \times \mathbb{R} \to \mathbb{R} \) is locally H"older continuous in \( t \), locally Lipschitz continuous in \( w \).

We define an operator \( A \), as follows,
\[
Au = -u'' \quad \text{with} \quad u \in D(A) = \{ u \in H^1_0(0, 1) \cap H^2(0, 1) : u'' \in X \}.
\]

Here clearly the operator \( A \) is self-adjoint with compact resolvent and is the infinitesimal generator of an analytic semigroup \( S(t) \). Now we take \( \alpha = 1/2 \), \( D(A^{1/2}) = H^1_0(0, 1) \) is the Banach space endowed with the norm,
\[
\|x\|_{1/2} := \|A^{1/2}x\|, \quad x \in D(A^{1/2})
\]
and we denote this space by \( X_{1/2} \). Also, for \( t \in [0, T] \), we denote
\[
C^{1/2}_t = C([0, t]; D(A^{1/2})),
\]
endowed with the sup norm
\[
\|\psi\|_{t, 1/2} := \sup_{0 \leq \eta \leq t} \|\psi(\eta)\|_\alpha, \quad \psi \in C^{1/2}_t.
\]

We observe some properties of the operators \( A \) and \( A^{1/2} \) defined by (5.2). For \( u \in D(A) \) and \( \lambda \in \mathbb{R} \), with \( Au = -u'' = \lambda u \), we have \( \langle Au, u \rangle = \langle \lambda u, u \rangle \); that is,
\[
\langle -u'', u \rangle = |u''|^2_{L^2} = \lambda |u|^2_{L^2}
\]
so \( \lambda > 0 \). A solution \( u \) of \( Au = \lambda u \) is of the form
\[
u(x) = C \cos(\sqrt{\lambda}x) + D \sin(\sqrt{\lambda}x)
\]
and the conditions \( u(0) = u(1) = 0 \) imply that \( C = 0 \) and \( \lambda = \lambda_n = n^2 \pi^2, n \in \mathbb{N} \). Thus, for each \( n \in \mathbb{N} \), the corresponding solution is given by
\[
u_n(x) = D \sin(\sqrt{\lambda_n}x).
\]

EJQTDE, 2008 No. 27, p. 10
We have \( \langle u_n, u_m \rangle = 0 \) for \( n \neq m \) and \( \langle u_n, u_n \rangle = 1 \) and hence \( D = \sqrt{2} \). For \( u \in D(A) \), there exists a sequence of real numbers \( \{ \alpha_n \} \) such that

\[
\begin{align*}
u(x) &= \sum_{n \in \mathbb{N}} \alpha_n u_n(x), \\
\sum_{n \in \mathbb{N}} (\alpha_n)^2 &= +\infty \quad \text{and} \quad \sum_{n \in \mathbb{N}} (\lambda_n)^2 (\alpha_n)^2 < +\infty.
\end{align*}
\]

We have

\[
A^{1/2}u(x) = \sum_{n \in \mathbb{N}} \sqrt{\lambda_n} \alpha_n u_n(x)
\]

with \( u \in D(A^{1/2}) \); that is, \( \sum_{n \in \mathbb{N}} \lambda_n (\alpha_n)^2 < +\infty \). \( X_{-\frac{1}{2}} \) is an \( \infty \) norm with the equivalent norm \( \| \cdot \|_{-\frac{1}{2}} = \sum_{n=1}^{\infty} |\langle \cdot, u_n \rangle|^2 \). For more details on the Sobolev space of negative index, we refer to Gal [6].

The equation (5.1) can be reformulated as the following abstract equation in \( X = L^2(0,1) \):

\[
\frac{d}{dt}[u(t) + g(t, u(a(t)))] + A[u(t) + g(t, u(a(t)))] = f(t, u(t), u[h(u(t), t)]) \quad t > 0,
\]

\[
u(0) = u_0,
\]

where \( u(t) = w(t, \cdot) \) that is \( u(t)(x) = w(t, x), x \in (0,1) \). The function \( g : \mathbb{R}_+ \times X_{1/2} \to X \), such that \( g(t, u(a(t)))(x) = \frac{1}{2} x f_1(t, w(a(t), x)) \) and the operator \( A \) is same as in equation (5.2).

The function \( f : \mathbb{R}_+ \times X_{1/2} \times X_{-1/2} \to X \), is given by

\[
f(t, u, \xi)(x) = f_2(x, \xi) + f_3(t, x, \psi),
\]

where \( f_2 : [0,1] \times X \to H^1(0,1) \) is given by

\[
f_2(t, \xi) = \int_0^x K(x, y) \xi(y) dy,
\]

and

\[
\|f_2(t, x, \psi)\| \leq Q(x, t)(1 + \|\psi\|_{H^2(0,1)})
\]

with \( Q(\cdot, t) \in X \) and \( Q \) is continuous in its second argument. We can easily verify that the function \( f \) satisfies the assumptions (H1)-(H4). For more details see [6].

For the function \( a \) we can take

(i) \( a(t) = kt \), where \( t \in [0, T] \) and \( 0 < k < 1 \).

(ii) \( a(t) = k t^n \) for \( t \in I = [0, 1] \quad k \in (0, 1) \) and \( n \in \mathbb{N} \);

(iii) \( a(t) = k \sin t \) for \( t \in I = [0, \frac{T}{2}] \), and \( k \in (0, 1) \).
