Abstract

Eight cobweb spider species building a detritus-based, bell-shaped retreat from China are reported in the current paper, including five new Campanicola species and three known species: Campanicola anguilliformis Li & Liu, sp. nov., Campanicola falciformis Li & Liu, sp. nov., Campanicola heteroidea Li & Liu, sp. nov., Campanicola tauricornis Li & Liu, sp. nov., Campanicola volubilis Li & Liu, sp. nov., Campanicola campanulata (Chen, 1993), Campanicola ferrumequina (Bösenberg & Strand, 1906), and Parasteatoda ducta (Zhu, 1998). Among them, the male of Parasteatoda ducta (Zhu, 1998) is described for the first time. We provide photographs of all species and descriptions for new species in the current paper. The type of bell-shaped retreat is rare in theridiid, and found only in four related genera. A natural next step upon completing this taxonomic study would be to analyse and understand the evolution of the retreat and related traits.

Keywords

Bell-shaped retreat, Campanicola, new species, taxonomy, theridiid spiders, trash-decorating behaviour
Introduction

Orb-weaving spiders often employ a variety of ‘trash’ materials such as soil particles, plant detritus, prey remains and egg sacs into webs, which can effectively deceive predators, thereby increasing their chances of survival (Ma et al. 2020). This trash-decorating behaviour has mainly been reported in a few taxa, such as *Cyclosa* spiders (Herberstein et al. 2000), diguetid spiders (Gertsch 1958), the spider *Azilia vachoni* (Sewlal 2016) and cobweb spiders (Yoshida 2015). Among of them, some cobweb spiders are famous for building a bell-shaped retreat (Fig. 15), including four genera: *Achaearanea* Strand, 1929: *Achaearanea globispira* Henschel & Jocqué, 1994; *Cryptachaeta* Archer, 1946: *Cryptachaeta riparia* (Blackwall, 1834), *Cryptachaeta ogatai* Yoshida, 2016; *Parasteatoda* Archer, 1946: *Parasteatoda ducta* (Zhu, 1998), *Parasteatoda angulithorax* (Bösenberg & Strand, 1906), *Parasteatoda tabulata* (Levi, 1980); *Campanicola* Yoshida, 2015: *Campanicola campanulata* (Chen, 1993), *Campanicola ferrumequina* (Bösenberg & Strand, 1906), *Campanicola tanakai* Yoshida, 2015, *Campanicola chitouensis* Yoshida, 2015, *Campanicola formosana* Yoshida, 2015 (Henschel and Jocqué 1994; Zhu 1998; Yoshida 2009, 2015, 2016).

In the past three years, a series of surveys on Chinese theridiid spiders were conducted by colleagues of Hubei University in China and yielded numerous new species. This is our first paper on Chinese cobweb spiders with the aim to describe the species building bell-shaped retreats including seven *Campanicola* species and one *Parasteatoda* species.

Materials and methods

All specimens were kept in 100% ethanol and examined with an Olympus SZX16 stereomicroscope. Further details were studied under an Olympus BX51 compound microscope. Male and female genitalia were examined and illustrated after dissection. Epigynes were cleaned by Proteinase K solution. Male left palps and female epigynes were imaged with an Olympus BX51 compound microscope in ethanol and in Arabic gum. For SEM, specimens were treated according to Agnarsson (2004). Male palps were cleaned ultrasonically for 1 minute, transferred to 100% ethanol overnight, then air-dried. Palps were glued to round-headed rivets using conductive adhesive, then sputter coated and imaged by a field emission scanning electron microscope (FE-SEM JSM7100F, JEOL, JP). Spider body photos were obtained using a Leica 205C digital microscope. All images were assembled using Helicon Focus image stacking software. All measurements were obtained using a Leica 205C digital microscope and given in millimeters. Eye diameters were taken at the widest point. Leg lengths are given as: total length (femur, patella, tibia, metatarsus, tarsus). All specimens studied are deposited in Centre for Behavioural Ecology and Evolution (CBEE), College of Life Science, Hubei University, Wuhan, China.

Taxonomy

Family Theridiidae Sundevall, 1833

Genus Campanicola Yoshida, 2015

Diagnosis. Campanicola is similar to some Achaearanea, Cryptachaea, Parasteatoda in building a detritus-based and bell-shaped retreat, but can be distinguished morphologically from Achaearanea by the cymbium with cymbial hood and without a distal projection in Campanicola, but with a cymbial hook and large distal projections in Achaearanea; from Cryptachaea by the cymbium not extending beyond the alveolus, the tegulum depressed and the copulatory ducts long in Campanicola, but the cymbium extending beyond alveolus, the tegulum spherical and the copulatory ducts short in Cryptachaea; from Parasteatoda by the conductor tip curved dorsally, the embolus and the copulatory ducts thin and the atrium small in Campanicola, but the conductor tip curved ventrally, the embolus and the copulatory ducts thick, the atrium large in Parasteatoda (Yoshida 2008, 2015; Vanuytven 2021).

chuan City, Tenglongdong Scenic Spot (30°16′10″N, 108°56′15″E, 1070 m), 5 October 2018, F.X. Liu, Z.W. Deng and Z.C. Li leg.; 2 ♀, Jianshi County, Chaoyangguan (30°35′45″N, 109°42′52″E, 650 m), F.X. Liu, Z.W. Deng and Z.C. Li leg.

**Diagnosis.** The females of *C. campanulata* differ from all other *Campanicola* species by the copulatory pores that are circular and not clinging to the atrium margin, and the copulatory ducts that curve only twice (Fig. 1D–F). Males differ from all other *Campanicola* species by the shorter and darker conductor tip (Fig. 2D–F).

**Description.** See Zhu (1998).

**Distribution.** China (Sichuan, new province record; Hubei, Hunan, Guizhou, Zhejiang, Fujian, Henan) (Fig. 16).

Zhong and F.J. Liu leg.

**Diagnosis.** The females of *C. ferrumequina* differ from all other *Campanicola* species by the almost overlapping copulatory ducts except the short segment starting from the copulatory pores (Fig. 4F, H). Males differ from all other *Campanicola* species by the long conductor tip and the part of the conductor above the cymbium with helical lines (Figs 5D–F, 6A–C).
Figure 4. *Campanicola ferrumequina* (Bösenberg & Strand, 1906) A–C female habitus (A dorsal view, B lateral view, C ventral view) D–H female epigynum (D ventral view, uncleared, E ventral view, cleared, F dorsal view, cleared, G ventral view, cleared and embedded in Arabic gum, H dorsal view, cleared and embedded in Arabic gum). Scale bars: 0.5 mm (A–C); 0.1 mm (D–H).

*Campanicola anguilliformis* Li & Liu, sp. nov.

http://zoobank.org/989FD31C-343E-40E1-9063-E0ED7924B6DD

Figs 7, 16

**Type material.** *Holotype:* ♀, CHINA, Fujian Province: Wuyishan City, Wuyi Mountain Natural Reserves (26°39’42”N, 117°56’24”E, 399 m), 28 August 2019, Y. Zhong and F.J. Liu leg. **Paratypes:** 1 ♀, same data as holotype.

**Diagnosis.** This new species is similar to *C. ferrumequina, C. tauricornis* sp. nov. and *C. volubilis* sp. nov. in having spherical spermathecae, and long and looped copulatory ducts, but can be distinguished from them by the direction of the copulatory duct: it starts from the middle and anterior part of the atrium, extends posteriorly, then curves several times and enters the spermathecae laterally and ventrally in *C. anguilliformis* sp. nov. (Fig. 7E–H); it starts from the lateral and anterior part of the atrium, extends anteriorly, then curves several times and enters the spermathecae laterally and dorsally in *C. ferrumequina* (Fig. 4E–H); it starts from the lateral and anterior part of the atrium,
Figure 7. Campanicola anguilliformis sp. nov. A–C female habitus (A dorsal view B ventral view C lateral view) D–H female epigynum (D ventral view, not dissected E ventral view, cleared F dorsal view, cleared G ventral view, cleared and embedded in Arabic gum H dorsal view, cleared and embedded in Arabic gum). Scale bars: 0.5 mm (A–C); 0.1 mm (D–H).

extends anteriorly, then curves several times and enters the spermathecae laterally and ventrally in C. tauricornis sp. nov. and C. volubilis sp. nov. (Figs 10D–G, 11D–G).

Etymology. The specific name is derived from the Latin adjective anguilliformis, meaning eel-like, referring to the eel-like copulatory ducts; adjective.

Description. Male unknown. Female (holotype): Total length 2.06. Prosoma 0.91 long, 0.80 wide, brownish yellow, with black margin. Sternum 0.55 long, 0.51 wide, yellow, peltate, with sparse setae. Opisthosoma 1.45 long, 1.16 wide, dorsum
black, with two pairs of transverse patterns in the shape of mustache and a longitudinal stripe, irregular white spots distributed in the patterns and the stripe; venter yellowish, with few bright white spots. Anal tubercle yellow. Spinnerets surrounded with black ring, without colulus (Fig. 7A–C). Diameters of eyes: AME 0.07, ALE 0.08, PME 0.09, PLE 0.07. Interdistances of eyes: AME-AME 0.06, AME-ALE 0.03, PME-PME 0.07, PME-PLE 0.05. Clypeus 0.16 high, yellow. Chelicerae yellow, promargin with 2 teeth. Endites yellow. Labium 0.19 long, 0.05 wide, yellow and rectangular, fused with sternum. Measurements of legs: I 3.58 (1.12, 0.29, 0.80, 0.89, 0.48), II 2.50 (0.77, 0.29, 0.47, 0.56, 0.41), III 1.90 (0.60, 0.22, 0.32, 0.42, 0.34), IV 3.00 (0.98, 0.32, 0.62, 0.66, 0.42). Leg formula: I-IV-II-III. Femur and patella light yellow, tibia, metatarsus and tarsus orange yellow. Femur, tibia and metatarsus with dark brown ring. Epigynum: atrium depression, small and oval; copulatory pores distinguishable, close to each other, located on the middle and anterior part of atrium; copulatory ducts long, winding, lightly sclerotized, connected with spermathecae from anterior-ventral part; spermathecae spherical; fertilization ducts short, curved and tapering (Fig. 7E, F).

**Distribution.** China (Sichuan) (Fig. 16).

**Campanicola falciformis** Li & Liu, sp. nov.

**Type material.** **Holotype**♀, **China, Sichuan Province:** Emeishan City, Emei Mountain Scenic Spot, footpath from Wuxian Gang to Wannian Temple (29°35′3″N, 103°22′55″E, 940 m), 21 September 2018, F.X. Liu, Z.W. Deng and Z.C. Li leg. **Paratypes:** 12♀, same data as holotype; **Sichuan Province:** 2♀, Leshan City, Leshan Giant Buddha Scenic Spot (29°32′28″N, 103°46′19″E, 380 m), 24 September 2018, F.X. Liu, Z.W. Deng and Z.C. Li leg.; 1♀, Ya’an City, Baoxing County, Fengtong Stronghold (30°34′21″N, 102°52′59″E, 1540 m), 26 September 2018, F.X. Liu, Z.W. Deng and Z.C. Li leg.; 3♀, Ya’an City, Baoxing County, Panda Square (30°22′10″N, 102°48′50″E, 1060 m), 27 September 2018, F.X. Liu, Z.W. Deng and Z.C. Li leg.; 1♀, Ya’an City, Baoxing County, Longmen Town (30°15′14″N, 103°1′20″E, 810 m), 28 September 2018, F.X. Liu, Z.W. Deng and Z.C. Li leg.

**Diagnosis.** This new species can be distinguished from other *Campanicola* species, in the female, by the position of the copulatory pores: located on the lateral and posterior part of atrium in this new species while located anteriorly in other *Campanicola* species; and the relative position of the copulatory ducts to the spermathecae: partial copulatory ducts overlap the posterior-ventral half of the spermathecae in this new species (Fig. 8E, G), but nearly all copulatory ducts are below the spermathecae in other *Campanicola* species.

**Etymology.** The specific name is derived from the Latin adjective *falciformis*, meaning doubly falcate, referring to the falcate copulatory ducts in ventral view; adjective.

**Description.** Male unknown. **Female (holotype):** Total length 2.29. Prosoma 0.92 long, 0.79 wide, brown, with dark brown margin. Sternum 0.49 long, 0.47 wide,

**Type material.** Holotype: ♀, CHINA, Guizhou Province: Liupanshui City, Zhongshan District (26°35’50”N, 104°49’10”E, 1760 m), 26 August 2020, B. Liang and J.H. Wang leg.

**Diagnosis.** This new species can be distinguished from other *Campanicola* species by the following characteristics: epigynum dissymmetric; copulatory pores located on the anterior margin of the atrium; copulatory ducts short, winding simply (Fig. 9D, E).

**Etymology.** The specific name is derived from the Latin adjective *heteroides*, meaning asymmetrical, referring in essence to the dissymmetric epigynum structure; adjective.

**Description.** Male unknown. Female (holotype): Total length 4.12. Prosoma 1.66 long, 1.54 wide, brown, with few black patches in the centre. Sternum 0.90 long, 0.93 wide, yellow, with black patches and sparse setae. Opisthosoma 2.45 long, 2.22 wide, oval, armed with black setae, dorsum yellowish with a middle longitudinal black belt which is surrounded with bright white spots, and more laterally mottled. Venter yellowish-brown, with a broad black transverse stripe next to epigastric furrow. Anal tubercle yellowish. Spinnerets yellow, surrounded with black ring, without colulus (Fig. 9A–C). Diameters of eyes: AME 0.07, ALE 0.06, PME 0.05, PLE 0.05. Interdistances of eyes: AME-AME 0.04, AME-ALE 0.05, PME-PME 0.05, PME-PLE 0.06. Clypeus 0.16 high, yellow, with black posterior margin. Chelicerae yellowish, promargin with 2 teeth. Endites brown. Labium 0.21 long, 0.09 wide, yellowish-brown, rectangular, fused with sternum. Measurements of legs: I 4.84 (1.53, 0.22, 1.18, 1.23, 0.68), II 3.16 (0.99, 0.26, 0.69, 0.67, 0.55), III 2.63 (0.82, 0.25, 0.50, 0.58, 0.48), IV 4.03 (1.35, 0.38, 0.80, 0.90, 0.60). Leg formula: I-IV-II-III. Legs yellowish, with dark brown ring. Epigynum: atrium depression and oval; copulatory pores pronounced,
Figure 9. *Campanicola heteroidea* sp. nov. **Type material.** *Holotype:* ♀, China, Hainan Province: Limushan National Forest Park (19°10’N, 109°39’E), 20 July 2020, J. Liu leg.

**Diagnosis.** This new species is similar to *C. volubilis* sp. nov. in having the spherical spermathecae, the long and looped copulatory ducts which start from the lateral and anterior part of the atrium, extend anteriorly, then curve several times and enter the spermathecae laterally and ventrally, but can be distinguished from the latter by the following characteristics: 1. The copulatory pores are slightly separated from each other in this new species (Fig. 10D, F), but close to each other in *C. volubilis* sp. nov. (Fig. 11D, F); 2. The spermathecae are widely separated in this new species (Fig. 10D–G), but slightly separated in *C. volubilis* sp. nov. (Fig. 11D–G).

**Etymology.** The specific name is derived from the Latin adjective *tauricornis*, meaning ox horn-shaped, referring to the shape of the copulatory ducts in dorsal view; adjective.

**Description.** Male unknown. Female (holotype): Total length 4.02. Prosoma 1.59 long, 1.52 wide, brownish black. Sternum 0.86 long, 0.95 wide, yellow, with sparse setae. Opisthosoma 2.18 long, 2.16 wide, oval, mottled, armed with sparse black setae, both dorsum and venter with irregular black plaque and white spots. Anal tubercle yellowish. Spinnerets brownish, without colulus (Fig. 10A–C). Diameters of eyes: AME 0.09, ALE 0.07, PME 0.10, PLE 0.08. Interdistances of eyes: AME-AME 0.08, AME-ALE 0.03, PME-PME 0.07, PME-PLE 0.05. Clypeus 0.19 high, brown. Chelicerae yellow, promargin with 2 teeth. Endites brown. Labium 0.24 long, 0.08 wide, yellowish-brown, rectangular, fused with sternum. Measurements of legs: I 4.78 (1.54, 0.34, 1.00, 1.20, 0.70), II 3.32 (1.10, 0.32, 0.64, 0.76, 0.50), III 2.48 (0.84, 0.21, 0.48, 0.55, 0.40), IV 3.711 (1.27, 0.34, 0.75, 0.83, 0.53). Leg formula: I-IV-II-III. Legs yellow to brown, with brownish black ring pattern. Epigynum: atrium depression and oblate; copulatory pores distinguishable, located on anterior margin of atrium; copulatory ducts long, winding complexly, the part of copulatory ducts near copulatory pores is evidently more sclerotized than the part near spermathecae, connected with spermathecae from posterior part; spermathecae spherical, spacing obvious; fertilization ducts short, curved and tapering (Fig. 10D, E).

**Distribution.** China (Hainan) (Fig. 16).

cae, and connected with spermathecae from the posterior part; spermathecae small, spherical; fertilization ducts long and thin (Fig. 12D–G).

**Distribution.** China (Hainan) (Fig. 16).

**Discussion**

Eight cobweb spider species building detritus-based, bell-shaped retreats from China are reported in the current paper, including five new *Campanicola* species, two known *Campanicola* species and one known *Parasteatoda* species. However, all new species are reported only based on the female specimens because the male individuals are relatively difficult to collected in the field. According to our experience both in field collection and feeding in the lab, the males after maturity often stop weaving webs and leave their retreats to search for females. We investigated more than 500 retreats of *C. campanulata* in the field for research focused on its web-weaving behaviour, and only 21 males were collected, often found together with females (manuscript in preparation). Therefore, more thorough collecting or rearing juveniles in the lab may be needed to find further male individuals for these new species in the future.

The type of bell-shaped retreat is rare in the family Theridiidae, and found only in four related genera: *Achaearanea*, *Cryptachaea*, *Parasteatoda* and *Campanicola* (Henschel and Jocqué 1994; Zhu 1998; Yoshida 2009, 2015, 2016). All of them belong to the subfamily Theridiinae according to both morphological and molecular phylogeny (Agnarsson 2004; Liu et al. 2016). The relationship between these four genera is relatively complicated. And their respective monophyly remains to be verified. Many species in *Parasteatoda* and *Cryptachaea* were transferred from *Achaearanea*, and some species in *Parasteatoda* were transferred to *Campanicola* (Yoshida 2008; Backup et al. 2010; Yoshida 2015). Moreover, some *Parasteatoda* species are quite different from others, for example, the spermathecae of *Parasteatoda transipora* (Zhu & Zhang, 1992) and *Parasteatoda cingulata* (Zhu, 1998) is significantly smaller than other *Parasteatoda* species' (Zhu 1998). In addition, information on web-weaving behaviour (especially focused on the detritus-based, bell-shaped retreat) and ecology (such as the trade-off between the safety and predation) of these spiders is still limited. Therefore, a natural next step upon completing this taxonomic study would be to analyse and understand the evolution of the retreat and related traits.
