Citation: Peng Z, Li L-Z, Zhao M-J (2016) A new species and additional records of *Lobrathium* Mulsant & Rey (Coleoptera, Staphylinidae, Paederinae) from South China. ZooKeys 568: 51–58. doi: 10.3897/zookeys.568.7622

**Abstract**

Material of the genus *Lobrathium* Mulsant & Rey, 1878 from the Chinese provinces Fujian, Hunan, Sichuan, Guangdong and Guangxi is examined. Six species are identified, four of them described previously and two undescribed. *Lobrathium kedian* Peng & Li, **sp. n.** (Guangxi: Shiwangda Shan) is described and illustrated. One probably undescribed species remains unnamed. The female sexual characters of *L. flexum* Assing, 2014 are described and illustrated for the first time. The genus is now represented in mainland China by 43 species.

**Keywords**

Coleoptera, Staphylinidae, *Lobrathium*, new species, new records, China

**Introduction**

Until today, 42 species of the genus *Lobrathium* Mulsant & Rey have been reported from mainland China and 20 species from Taiwan (Assing 2010, 2012, 2013, 2014; Li et al. 2013; Li et al. 2013a, b, c; Lü and Li 2014). With a total of 14 described species, the *Lobrathium* fauna of Sichuan is currently more diverse than that of any of the other Chinese provinces, followed by Yunnan (8 species), Shaanxi (7 species), Guizhou (6 species) and Zhejiang (6 species) (Assing 2012, 2013, 2014; Li et al. 2013; Li et al. 2013a, b, c; Lü and Li 2014).
A study of *Lobrathium* material from southern China yielded a species new to science and additional records of *L. configens* Assing, 2012, *L. flexum* Assing, 2014, *L. hebeatum* Zheng, 1988 and *L. hongkongense* Bernhauer, 1931.

**Material and methods**

The following abbreviations are used in the text, with all measurements in millimeters:

Body length (BL) from the anterior margin of the labrum to the abdominal apex; forebody length (FL) from the anterior margin of the labrum to the posterior margin of the elytra; head length (HL) from the anterior clypeal margin to the occipital constriction; head width (HW): maximum width of head; length of antenna (AnL); length of pronotum (PL) along midline; maximum width of pronotum (PW); elytral length (EL) at the suture from the apex of the scutellum to the posterior margin of the elytra (at the sutural angles); maximum width of the elytra (EW); length of aedeagus (AL) from the apex of the dorsal plate to the base of the aedeagal capsule.

The type material is deposited in the Insect Collection of Shanghai Normal University, Shanghai, China (SNUC).

**Results**

* Lobrathium configens* Assing, 2012

Fig. 4

**Material studied.** China: Sichuan: 8 ♂♂, 2 ♀♀, Xiaojin County, Jiajin Shan, 30°48’49"N, 102°42’55"E, 2500 m, 20.VII.2015, Jiang, Peng, Tu & Zhou leg. (SNUC).

**Comment.** *Lobrathium configens* was previously known from the Chinese provinces Shaanxi, Sichuan, Qinghai, Hubei, Yunnan and Zhejiang (Assing 2012, 2013, 2014; Li et al. 2013a, b). For illustrations of *L. configens* see Assing (2012: figures 153–165) and Li et al. (2013a: figure 4).

* Lobrathium flexum* Assing, 2014

Figs 1A, 2A–C, 5

**Material studied.** China: Hunan: 1 ♂, 1 ♀, Yanling County, Nanfengmian, 26°18’N 114°00’E, 1600 m, 06.VI.2015, Peng, Shen, Tu & Zhou leg. (SNUC).

**Comment.** The original description is based on a male from Jiangxi. The previously unknown female sexual characters are as follows: posterior margin of tergite VIII convex (Fig. 2A); sternite VIII (Fig. 2B) weakly transverse, posteriorly broadly convex;

Figs 1B, 3, 7

**Type material.** **Holotype:** ♂, labelled ‘China: Guangxi Prov., Shangsi County, Shiwanda Shan, 300–500 m, 21°54’N, 107°54’E, 25–IV–2011, Peng & Zhu leg.’ (SNUC). **Paratypes:** 8 ♂♂, 8 ♀♀, same label data as holotype (SNUC).

**Description.** Measurements (in mm) and ratios: BL 9.88–10.20, FL 5.49–5.62, HL 1.37–1.42, HW 1.36–1.44, AnL 3.13–3.20, PL 1.57–1.63, PW 1.24–1.30, EL 1.35–1.39, EW 1.39–1.46, AL 1.13–1.20, HL/HW 0.97–1.00, HW/PW 1.06–1.10, HL/PL 0.85–0.88, PL/PW 1.25–1.27, EL/PL 0.84–0.87.

Habitus as in Fig. 1B. Coloration: body black, mandibles dark brown, labial palpi light brown; antennae dark brown to light brown; legs with blackish brown profemora and protibiae, basal halves of meso- and metafemora yellowish brown, distal halves gradually infuscate.

Head as wide as long, widest behind eyes; punctation coarse and very dense; interstices without microsculpture. Antenna as in Fig. 2D.

Pronotum distinctly longer than wide, with impunctate midline; punctation coarse and dense, but distinctly sparser than that of head; interstices glossy.

Elytra distinctly broader than pronotum; punctation coarse, arranged in irregular series only laterally. Hind wings approximately 1.85–2.02 times as long as elytra.

Abdomen somewhat narrower than elytra; punctation fine and dense; posterior margin of tergite VII with palisade fringe.

Male. Sternite VII (Fig. 3D) strongly transverse and with shallow median impression posteriorly, without modified setae, posterior margin broadly concave; sternite VIII (Fig. 3E) posteriorly with deep impression, this impression with a cluster of numerous short peg-setae, posterolaterally with a cluster of short black setae; posterior excision large, deep and U-shaped; aedeagus (Figs 3F, G) with apically bifid ventral process in ventral view and broad dorsal plate.

Female. Posterior margin of tergite VIII (Fig. 3A) convex; sternite VIII (Fig. 3B) weakly transverse, posterior margin broadly convex; tergite IX (Fig. 3C) slender and undivided anteriorly.

**Distribution and natural history.** The type locality is situated in Shiwangda Shan to the south of Shangsi, southern Guangxi. The specimens were sifted from leaf litter in broad-leaved forests at altitudes of 300–500 m (Fig. 7).

**Etymology.** The specific name is the Chinese noun “kedian” (punctuation) in apposition. It refers to the punctuation of the head of *L. kedian*, which is denser than that of other species known from Guangxi.
**Figure 3.** *Lobrathium kedian.*  
A female tergite VIII  
B female sternite VIII  
C female tergites IX–X  
D male tergite VIII  
E male sternite VIII  
F aedeagus in ventral view  
G aedeagus in lateral view.  
Scale bars: 0.5 mm.

**Comparative notes.** *Lobrathium kedian* shares a bifid ventral process with *L. digitatum* Assing, 2010 from Taiwan, but differs from it in many respects, particularly by larger body size, the shape and chaetotaxy of the male sternite VIII and by the shape of the aedeagus. For illustrations of *L. digitatum* see Assing (2010: figures 203–210).

**Lobrathium sp.**

**Material studied.** China: Sichuan: 1 ♀, Dayi County, Xiling Xueshan, 30°41'59"N, 103°12'10"E, 2150 m, 29.VII.2015, Jiang, Peng, Tu & Zhou leg. (SNUC).
A new species and additional records of Lobrathium Mulsant & Rey...

Figures 4–8. Habitats of Lobrathium. 4 Jiajin Shan, alt. 2500 m (L. configens) 5 Nanfengmian, alt. 1600 m (L. flexum and L. hongkongense) 6 Xiling Xueshan, alt. 2150 m (L. hbeatum and Lobrathium sp.) 7 Shiwangda Shan, alt. 300–500 m (L. kedian sp. nov.) 8 Lobrathium hongkongense walking on the stone.

Comment. This species is similar and probably closely related to L. daxuense Assing, 2012. The female represents an undescribed species distinguished from its congeners particularly by the light brown coloration, large body size (8.34 mm), much denser punctuation of the head, a slender pronotum, and the female secondary sexual characters.
Acknowledgements

All the collectors mentioned in the text are acknowledged for their field work. Two anonymous reviewers are thanked for comments on a previous version of the manuscript. We are most grateful to Volker Assing (Hannover) for revising an earlier version of the manuscript. The study is supported by the National Natural Science Foundation of China (No. 31201734 and 31101659), the Foundation of Shanghai Municipal Education Commission (No. 12YZ077) and Shanghai Normal University (SK201234, DZL125 and B–9013–11–003127).
