This paper is devoted to describe the notion of a parameterized degree of continuity for mappings between L-fuzzy soft topological spaces, where L is a complete De Morgan algebra. The degrees of openness, closedness, and being a homeomorphism for the fuzzy soft mappings are also presented. The properties and characterizations of the proposed notions are pictured. Besides, the degree of continuity for a fuzzy soft mapping is unified with the degree of compactness and connectedness in a natural way.

1. Introduction

The theory of fuzzy sets which is a way of modeling real-life problems involves uncertainty, based on the degree of membership of an element to some sets. This idea has impressed many researchers working in diverse areas. Especially, the topology workers applied this idea to the gradation of openness and hence gave birth to the fuzzy topology [1]. The fuzzy-fuzzy case of the topology is the most compatible way of reflecting the gradation of belongingness [2]. So naturally, the notions of the degree of compactness, the degree of connectedness, the degree of separations, and so on have been considered. Later on, the similar argument has been considered for the mappings between fuzzy topological spaces and the degree of continuity, the degree of openness, and the degree of closedness for (fuzzy) mappings have been described [3–5]. The theory of soft sets is one of the other tools to model vague phenomena [6]. Also, the combination of fuzzy sets and soft sets gave birth to the fuzzy soft sets [7–9] and the basic idea of this new kind of sets depends on the parameterized degree of membership of an element to some sets. Nowadays, the studies depending on the soft sets and the fuzzy soft sets are increasing rapidly [10–13].

The idea of fuzzy softness (in fact, “parameterized gradation”) is one of the appropriate tools for modeling of environmental and mathematical problems. On the other hand, the mappings play the key role in transforming the characteristics between structured spaces. Especially, the continuous mappings are worth to investigate since they preserve the several properties of the spaces endowed with topology. Motivated from this thinking, we found it reasonable to present a new theory which gives a more accurate and efficient way of transforming the characteristics between the fuzzy soft topological spaces depending on the parameters. Thus, as a continuation of the research studies [14–16], we describe the parameterized gradations of continuity, openness, and closedness for mappings between fuzzy soft topological spaces.

The content of this study is organized in the following manner: in Section 2, we present the notations and recall the elementary notions which are used throughout the study. In Section 3, we define the parameterized degree of the concepts of continuity, openness, closedness, and being homeomorphism for mappings transformed between fuzzy soft topological spaces. We investigate the parameterized graded extensions of the main properties and results known in general topology, for the proposed concepts. Additionally, we observe several characterizations of the described gradations with the help of the neighborhood systems and closure (interior) operators. At the end, we unify the parameterized graded continuity with the parameterized compactness (connectedness, respectively) degree.

2. Preliminaries

Throughout this paper, X refers to a nonempty initial universe, E and K denotes the arbitrary nonempty sets
viewed on the set of parameters, and $L = (L, ∨, ∧, ')$ denotes a complete De Morgan algebra with the smallest element $0_L$ and the largest element $1_L$. With the underlying lattice $L$, a mapping $A: X \longrightarrow L$ is said to be an $L$-fuzzy set on $X$ and by $L^X$, we denote the family of all $L$-fuzzy sets on $X$.

An element $α$ in $L$ is said to be coprime if $α ≤ β ∨ γ$ implies that $α ≤ β$ or $α ≤ γ$. $M(L)$ denotes the collection of all coprime elements of $L$. We say $α$ is way below (wedge below) $β$, in symbols, $α \ll β$, $(α ≤ β)$, if for every directed (arbitrary) subset $D ⊆ L$, $∀D ≥ β$ implies $α ≤ γ$ for some $γ ∈ D$. Clearly, if $α ∈ L$ is coprime, then $α \ll β$ if and only if $α \ll β$. Details for lattices can be found in [17].

The binary operation $→$ in the complete De Morgan algebra $L$ is given by $α → β = \bigvee \{γ ∈ L | α ∧ γ ≤ β\}$.

For all $α, β, γ, δ ∈ L$ and $\{[α], [β], [γ], [δ]\} ⊆ L$, the following properties are satisfied:

1. $(α → β) ≥ γ$ iff $α ∧ γ ≤ β$
2. $α → β = 1_L$ iff $α ≤ β$
3. $α → (δ ∧ β) = (α → δ) ∧ (α → β)$ and $(α → δ) = α → (δ ∧ β)$
4. $(α → γ ∧ β) = (α → β) ∨ (α → γ)$
5. $α ≤ β$ implies $α ≤ γ$ and $β ≤ γ$ implies $α ≤ γ$
6. $(α → β) ∧ (γ → δ) ≤ (α ∧ γ) → (β ∧ δ)$

Definition 1 (see [18]). A mapping $f: E \longrightarrow (L^X)_E$ is called an $L$-fuzzy soft set on $X$. This means that $f_e: = f(e): X \longrightarrow L$ is an $L$-fuzzy set on $X$, for each parameter $e ∈ E$. Hence, an $L$-fuzzy soft set can be considered as the parameterized extended version of an $L$-fuzzy set. Intuitively, by a fuzzy soft set, one can describe the parameterized degree of belongingness.

From now on, we use the symbol $(L^X)_E$ to denote the collection of all $L$-fuzzy soft sets on $X$.

Definition 2 (see [18, 19]). Let $f$ and $g$ be two $L$-fuzzy soft sets on $X$; then, the set operations are defined as follows:

1. $f$ is an $L$-fuzzy soft subset of $g$ and written by $f \subseteq g$ if $f_e ≤ g_e$, for each $e ∈ E$. $f$ and $g$ are called equal if $f \subseteq g$ and $g \subseteq f$.

2. The union of $f$ and $g$ is an $L$-fuzzy soft set $h = f \sqcup g$, where $h_e = f_e \lor g_e$, for each $e ∈ E$.
3. The intersection of $f$ and $g$ is an $L$-fuzzy soft set $h = f \sqcap g$, where $h_e = f_e \land g_e$, for each $e ∈ E$.
4. The complement of $f$ is denoted by $f^c$, where $f^c_e = (f_e)^c$, for each $e ∈ E$.

Definition 3 (see [18]).

1. An $L$-fuzzy soft set $f$ on $X$ is called a null (or empty) $L$-fuzzy soft set and denoted by $0$, if $f_e(x) = 0_L$, for each $e ∈ E, x ∈ X$.
2. An $L$-fuzzy soft set $f$ on $X$ is called an absolute (or universal) $L$-fuzzy soft set and denoted by $1$, if $f_e(x) = 1_L$, for each $e ∈ E, x ∈ X$. Clearly $(1)^c = 0$ and $0^c = 1$.

Definition 4 (see [20]). Let $x ∈ X$ and $α: E \longrightarrow M(L)$ be a function. Then, the $L$-fuzzy soft set defined as follows is called an $L$-fuzzy soft point and denoted by $x^α$.

$$x^α_e(y) = \begin{cases} α(e), & \text{if } y = x, \\ 0_L, & \text{otherwise}, \end{cases}$$

for all $e ∈ E$ and $y ∈ X$.

An $L$-fuzzy soft point $x^α$ is said to belong to an $L$-fuzzy soft set $f$ and denoted by $x^α ∈ f$ if $α(e) ≤ f_e(x)$, for each $e ∈ E$.

The set of all nonzero coprime elements of $(L^X)_E$ is denoted by $M((L^X)_E)$. It is noted that $M((L^X)_E)$ is exactly the set of all $L$-fuzzy soft points.

Definition 5 (see [21]). Let $ψ: X_1 \longrightarrow X_2$ and $ψ: E_1 \longrightarrow E_2$ be two functions, where $E_1$ and $E_2$ are parameter sets for the crisp sets $X_1$ and $X_2$, respectively. Then, the pair $(ψ, ψ) := ψ_ψ$ is called an $L$-fuzzy soft mapping from $(X_1, E_1)$ to $(X_2, E_2)$:

1. The image of $f ∈ (L^X)_E$ under $ψ_ψ$, denoted by $ψ_ψ(f)$, is an $L$-fuzzy soft set on $X_2$ defined by

$$ψ_ψ(f)_k(y) = \begin{cases} \bigvee_{ψ(x)=y} \bigvee_{ψ(a)=k} f_a(x), & \text{if } x \in ψ^{-1}(y), a \in ψ^{-1}(k), \\ 0_L, & \text{otherwise}, \end{cases}$$

for all $k ∈ E_2, y ∈ X_2$.

2. The inverse image of $g ∈ (L^X)_E$ under $ψ_ψ$, denoted by $ψ_ψ^{-1}(g)$, is an $L$-fuzzy soft set on $X_1$ defined by

$$ψ_ψ^{-1}(g)_e(x) = g_{ψ(c)}(ψ(x)), \quad \text{for all } e ∈ E_1, x ∈ X_1.$$
For a fixed fuzzy soft point $(x, \tau)$, the degree of openness of an $m$-dimensional mapping $\tau$ and value incident neighborhood (shortly, topology on $E$). Let $\alpha: X \to K$, $\tau^\alpha(x)$ be crisp functions. Then, the fuzzy soft mapping $\tau^\alpha(x)$ is continuous if for each $(h, L^2)$, the mapping is $\tau^\alpha(x)$ continuous on $X$. Then, the collection of maps $N = \{N_x| x \in M(\mathbb{L})\}$ is an L-fuzzy $(E, K)$-soft neighborhood (shortly, ndhood) system on $X$.

**Definition 10** (see [16]). A mapping $\text{cl}: K \times (L^2)^E \to L^M(\mathbb{L})$ is called an L-fuzzy $(E, K)$-soft closure operator on $X$ if it satisfies the following axioms for each $k \in K$:

- **C1** $\text{cl}(k, (x^a)) = \bigwedge_{\beta \in \Delta}(\text{cl}(k, f), (x^\beta))$, for all $x^\beta \in M(\mathbb{L})$.
- **C2** $\text{cl}(k, (0)) = 0_k$ for any $x^a \in (L^2)^E$.
- **C3** $\text{cl}(k, (x^a)) = 1_k$ for any $x^a \notin f$.
- **C4** $\text{cl}(k, (f \cup g)) = \text{cl}(k, f) \cup \text{cl}(k, g)$.
- **C5** $\sigma_a(\text{cl}(k, x)) \subseteq \text{cl}(k, f)$, where $\sigma_a(\text{cl}(k, f)) = \{x^a \in M(\mathbb{L})| \text{cl}(k, (x^a)) \geq a\}$.

The value $\text{cl}(k, (x^a))$ is interpreted as the degree to which $x^a$ belongs to the parameterized closure of the fuzzy soft set $f$.

**Example 1** (see [16]). Let $\text{cl}: K \times (L^2)^E \to (L^2)^E$ be the closure operator given in a parameterized L-fuzzy topological space $(X, T)$. In this case, the mapping is $\text{Cl}(k, f): M(\mathbb{L}) \to 2$ defined in such a way that

$$\text{Cl}(k, f)(x^a) = \begin{cases} 1, & \text{if } x^a \notin \text{cl}(k, f), \\ 0, & \text{otherwise,} \end{cases}$$

satisfies the conditions of Definition 10.

**Theorem 1** (see [16]). Let $\tau$ be an L-fuzzy $(E, K)$-soft topology on $X$. Then, the mapping $\text{C}: K \times (L^2)^E \to L^M(\mathbb{L})$ defined by

$$\text{C}(k, f)(x^a) = (Q_{f^a}(k, f^a))'$$

is an L-fuzzy $(E, K)$-soft closure operator on $X$, which is called the L-fuzzy $(E, K)$-soft closure operator induced by $\tau$.

**Definition 11.** A mapping $\text{Int}: K \times (L^2)^E \to L^M(\mathbb{L})$ is called an L-fuzzy $(E, K)$-soft interior operator on $X$ if it satisfies the following axioms for each $k \in K$:

- **I1** $\text{Int}(k, f)(x^a) = \bigwedge_{\beta \in \Delta}(\text{Int}(k, f), (x^\beta))$, for all $x^\beta \in M(\mathbb{L})$.
- **I2** $\text{Int}(k, (0)) = 0_k$ for any $x^a \in (L^2)^E$.
- **I3** $\text{Int}(k, (x^a)) = 1_k$ for any $x^a \notin f$.
- **I4** $\text{Int}(k, (f \cup g)) = \text{Int}(k, f) \cup \text{Int}(k, g)$.
- **I5** $\delta_a(\text{Int}(k, f)) \subseteq \delta_a(\text{Int}(k, f))$, where $\delta_a(\text{Int}(k, f)) = \{x^a \in M(\mathbb{L})| \text{Int}(k, (x^a)) \leq a\}$, for all $a \in L'\{1\}$.

The value $\text{Int}(k, (x^a))$ is interpreted as the degree to which $x^a$ belongs to the parameterized interior of the fuzzy soft set $f$.

**Theorem 2.** Let $\tau$ be an L-fuzzy $(E, K)$-soft topology on $X$, and let $\mathcal{N} = \{N_x| x \in M(\mathbb{L})\}$ be the ndhood system induced by $\tau$. Define a mapping $\text{I}: K \times (L^2)^E \to L^M(\mathbb{L})$ by
Theorem 3 (see [16]). Let $X$ be a topological space. Then, identify a mapping $\text{com}_\tau: K \rightarrow (L^X)^E$ in such a way that in order to picture the parameterized compactness degree,

$\text{com}_\tau(k,g) = \bigwedge_{\forall \in (L^X)^E} \left( \bigwedge_{h \in \mathcal{U}} \tau_k(h) \rightarrow \left( \bigwedge_{x \in X \in \mathcal{E}} \left( g'_\phi(x) \vee h_k(x) \right) \right) \right) \rightarrow \bigvee_{\forall \in (\mathcal{U})^E} \left( \bigwedge_{x \in X \in \mathcal{E}} \left( g'_\phi(x) \vee h_k(x) \right) \right) \bigg)$.

(8)

Definition 12 (see [22]). Let $(X, \tau)$ be an $L$-fuzzy $(E, K)$-soft topological space. Then, identify a mapping $\text{com}_\tau: K \rightarrow (L^X)^E$ in such a way that in order to picture the parameterized compactness degree,

Definition 13 (see [16]). Let $(X, \tau)$ be an $L$-fuzzy $(E, K)$-soft topological space. Then, identify a mapping $\text{com}: \tau \times (L^X)^E \rightarrow L$ by the following manner in order to describe the connectivity degree in such spaces:

$\text{Con}(k, h) = \bigwedge \left\{ \bigvee_{x \in \mathcal{U}} C(k, g)(x) \vee \bigvee_{y \in \mathcal{V}} C(k, f)(y) \vDash h \in (L^X)^E, h = f \cup g \right\}$.

(9)

Theorem 3 (see [16]). Let $\tau$ be an $L$-fuzzy $(E, K)$-soft topology on $X$. Then, one can characterize the parameterized degree of connectivity of an $L$-fuzzy soft set $g \in (L^X)^E$ in the following way:

$\text{Con}(k, g) = \bigwedge \left\{ \bigvee_{x \in \mathcal{U}} C(k, g)(x) \vee \bigvee_{y \in \mathcal{V}} C(k, f)(y) \vDash h \in (L^X)^E, h = f \cup g \right\}$.

(10)

3. Degree of Continuity for Fuzzy Soft Mappings

In this section, we identify the degrees of continuity, openness, closedness, and being a homeomorphism for a fuzzy soft mapping. Then, we study some of their characteristics by means of the $\text{n}$-hhood, $\text{n}$ighborhood, and closure operators. We also observe the elementary features of the proposed notions.

Definition 15. Let $(X_1, \tau_1)$ and $(X_2, \tau_2)$ be the $L$-fuzzy $(E_1, K_1)$-soft and $(E_2, K_2)$-soft topological spaces, respectively, and $\varphi_{\psi, \eta}: (X_1, \tau_1) \rightarrow (X_2, \tau_2)$ be a soft mapping. Then, we define the following

(1) The parameterized degree of continuity for $\varphi_{\psi, \eta}$ is as follows: for all $k \in K_1$,

$\text{Cont}(k, \varphi_{\psi, \eta}) = \bigwedge_{g \in (L^X)^E} \left( \tau_k^2(\varphi^{-1}(g)) \rightarrow \tau_k^1(\varphi^{-1}(g)) \right)$.

(11)

The value $\text{Cont}(k, \varphi_{\psi, \eta})$ represents to which $\varphi_{\psi, \eta}$ is continuous with respect to some parameters. Hence, the degree of continuity for $\varphi_{\psi, \eta}$ is computed by the formula $\text{Cont}(\varphi_{\psi, \eta}) = \bigwedge_{k \in K_1} \text{Cont}(k, \varphi_{\psi, \eta})$.

Definition 16. Let $(X_1, \tau_1)$ and $(X_2, \tau_2)$ be the $L$-fuzzy $(E_1, K_1)$-soft and $(E_2, K_2)$-soft topological spaces, respectively, and $\varphi_{\psi, \eta}: (X_1, \tau_1) \rightarrow (X_2, \tau_2)$ be a bijective soft mapping. Then, the parameterized degree of being a homeomorphism for the soft mapping $\varphi_{\psi, \eta}$ is identified by $\text{Hom}(k, \varphi_{\psi, \eta}) = \text{Cont}(k, \varphi_{\psi, \eta}) \land \text{Open}(k, \varphi_{\psi, \eta})$. Hence, $\text{Hom}(\varphi_{\psi, \eta}) = \text{Cont}(\varphi_{\psi, \eta}) \land \text{Open}(\varphi_{\psi, \eta})$.

Remark 1

(1) If the value $\text{Cont}(\varphi_{\psi, \eta}) = 1_L$, then it is seen that $\tau_k^1(\varphi^{-1}(g)) \geq \tau_k^1(\varphi^{-1}(g))$ for each $k \in K_1$ and for each $g \in (L^X)^E$. Is satisfied. This gives us the definition of
continuity for the mapping \( \varphi_{|\varphi|} : (X_1, \tau^1) \rightarrow (X_2, \tau^2) \). Analogously, if \( \text{Open}(\varphi_{|\varphi|}) = 1 \) or \( \text{Clos}(\varphi_{|\varphi|}) = 1 \), then (2) and (3) of Definition 15 are just the definitions of openness and closedness for the mapping \( \varphi_{|\varphi|} \), respectively.

(2) If \( \varphi = \text{id}_{X_i}, \psi = \text{id}_{X_i} \), and \( \eta = \text{id}_{X_i} \) are the corresponding identity mappings, then \( \varphi_{|\varphi|}(X, \tau) = (X, \tau) \) is the identity soft mapping and \( \text{Cont}(\varphi_{|\varphi|}) = \text{Hom}(\varphi_{|\varphi|}) = 1 \).

**Theorem 4.** Let \( (X_i, \tau^i) \) be the \( L \)-fuzzy \( (E_i, K_i) \)-soft topological spaces \( (i = 1, 2, 3) \) and \( \varphi_{|\varphi|} : (X_1, \tau^1) \rightarrow (X_2, \tau^2) \) and \( \delta_{\xi} : (X_2, \tau^2) \rightarrow (X_3, \tau^3) \) be the soft mappings. Then, the following is satisfied:

\[
\begin{align*}
\text{Cont}(k, \varphi_{|\varphi|} \wedge \text{Cont}(\eta(k), \delta_{\xi})) & = \bigwedge_{g \in (L^2)^g} \tau_{g(k)}^{2} \left( \varphi_{|\varphi|}^{-1}(g) \right) \wedge \bigwedge_{h \in (L^3)^h} \left( \tau_{\eta(k)}^{3}(h) \rightarrow \tau_{\eta(k)}^{3}(\delta_{\xi}^{-1}(h)) \right) \\
& \leq \bigwedge_{h \in (L^3)^h} \tau_{\eta(k)}^{3}(h) \left( \delta_{\xi}^{-1}(h) \right) \left( \delta_{\xi}^{-1}(h) \right) \left( \delta_{\xi}^{-1}(h) \right) \left( \delta_{\xi}^{-1}(h) \right) \\
& \leq \bigwedge_{h \in (L^3)^h} \tau_{\eta(k)}^{3}(h) \left( \delta_{\xi}^{-1}(h) \right) \left( \delta_{\xi}^{-1}(h) \right) \left( \delta_{\xi}^{-1}(h) \right) \left( \delta_{\xi}^{-1}(h) \right) \\
& \leq \bigwedge_{h \in (L^3)^h} \left( \tau_{\eta(k)}^{3}(h) \rightarrow \tau_{\eta(k)}^{3}(\delta_{\xi}^{-1}(h)) \right) \\
& = \text{Cont}(k, \delta_{\xi} \circ \varphi_{|\varphi|}),
\end{align*}
\]

for any \( k \in K_1 \).

The above fact witnesses the proof.

The other conditions are similarly proved.

As it is well known in general topology, the composition of two homeomorphisms is again a homeomorphism. Then, by the above theorem, we get the following result for the gradation of homeomorphism.

**Corollary 1.** Let \( (X_i, \tau^i) \) be the \( L \)-fuzzy \( (E_i, K_i) \)-soft topological spaces \( (i = 1, 2, 3) \) and \( \varphi_{|\varphi|} : (X_1, \tau^1) \rightarrow (X_2, \tau^2) \) and \( \delta_{\xi} : (X_2, \tau^2) \rightarrow (X_3, \tau^3) \) be two bijective soft mappings. Then, \( \text{Hom}(\delta_{\xi} \circ \varphi_{|\varphi|}) \geq \text{Hom}(\varphi_{|\varphi|}) \wedge \text{Hom}(\delta_{\xi}) \) is satisfied.

\[
\begin{align*}
\text{Open}(k, \delta_{\xi} \circ \varphi_{|\varphi|}) & \wedge \text{Cont}(k, \varphi_{|\varphi|}) \\
& = \bigwedge_{f \in (L^2)^f} \left( \tau_{f(k)}^{2}(f) \rightarrow \tau_{\eta(k)}^{2}(\delta_{\xi} \circ \varphi_{|\varphi|})(f) \right) \\
& \leq \bigwedge_{g \in (L^2)^g} \left( \tau_{g(k)}^{2}(g) \rightarrow \tau_{\eta(k)}^{2}(\delta_{\xi} \circ \varphi_{|\varphi|})(g) \right) \\
& \leq \bigwedge_{g \in (L^2)^g} \left( \tau_{g(k)}^{2}(g) \rightarrow \tau_{\eta(k)}^{2}(\delta_{\xi} \circ \varphi_{|\varphi|})(g) \right) \\
& = \text{Open}(\eta(k), \delta_{\xi}),
\end{align*}
\]

**Theorem 5.** Let \( (X_i, \tau^i) \) be the \( L \)-fuzzy \( (E_i, K_i) \)-soft topological spaces \( (i = 1, 2, 3) \) and \( \delta_{\xi} : (X_2, \tau^2) \rightarrow (X_3, \tau^3) \) be a soft mapping. If the fuzzy soft mapping \( \varphi_{|\varphi|} : (X_1, \tau^1) \rightarrow (X_2, \tau^2) \) is surjective, then we get the following properties:

\[
\begin{align*}
\text{(1)} \ & \text{Open}(\delta_{\xi} \circ \varphi_{|\varphi|}) \wedge \text{Cont}(\varphi_{|\varphi|}) \leq \text{Open}(\delta_{\xi}) \\
\text{(2)} \ & \text{Clos}(\delta_{\xi} \circ \varphi_{|\varphi|}) \wedge \text{Cont}(\varphi_{|\varphi|}) \leq \text{Clos}(\delta_{\xi})
\end{align*}
\]

**Proof.** (2) If we consider Definition 15, then we obtain the following inequality:
for all $k \in K_1$.

Since $k \in K_1$ is arbitrary, we obtain the claimed inequality $\text{Open}(\delta_{\xi_0} \varphi_{\eta}) \land \text{Cont}(\varphi_{\eta}) \leq \text{Open}(\delta_{\xi_0})$.

\textbf{Theorem 6.} Let $(X_1, \tau_1)$ be the $L$-fuzzy $(E_1, K_1)$-soft topological spaces (where $i = 1, 2, 3$) and $\varphi_{\eta}: (X_1, \tau_1) \rightarrow (X_2, \tau_2)$ a fuzzy soft mapping. If the fuzzy soft mapping $\delta_{\xi_0}: (X_2, \tau_2) \rightarrow (X_3, \tau_3)$ is injective, then we get the following properties:

\textbf{Proof.} (1) By considering the definitions, we get the following:

\begin{align*}
\text{Open}(\delta_{\xi_0} \varphi_{\eta}) \land \text{Cont}(\delta_{\xi_0}) &= \bigwedge_{k \in K_1} \bigwedge_{f \in (LX_1)^{\eta}} \left( \tau_1^1(f) \rightarrow \tau_{\sigma(h)}^1(\delta_{\xi_0} \varphi_{\eta}(f)) \right) \land \bigwedge_{k' \in K_2} \bigwedge_{h \in (LX_2)^{\eta}} \left( \tau_{\delta_{\xi_0}(h)}^1(h) \rightarrow \tau_{\delta_{\xi_0}(h)}^1(\delta_{\xi_0} \varphi_{\eta}(h)) \right) \\
&\leq \bigwedge_{k \in K_1} \bigwedge_{f \in (LX_1)^{\eta}} \left( \tau_1^1(f) \rightarrow \tau_{\sigma(h)}^1(\delta_{\xi_0} \varphi_{\eta}(f)) \right) \land \bigwedge_{k' \in K_2} \bigwedge_{g \in (LX_2)^{\eta}} \left( \tau_{\delta_{\xi_0}(h)}^1(h) \rightarrow \tau_{\delta_{\xi_0}(h)}^1(\delta_{\xi_0} \varphi_{\eta}(h)) \right) \\
&\leq \bigwedge_{k \in K_1} \bigwedge_{f \in (LX_1)^{\eta}} \left( \tau_1^1(f) \rightarrow \tau_{\delta_{\xi_0}(h)}^1(\delta_{\xi_0} \varphi_{\eta}(f)) \right) \land \bigwedge_{k' \in K_2} \bigwedge_{g \in (LX_2)^{\eta}} \left( \tau_{\delta_{\xi_0}(h)}^1(h) \rightarrow \tau_{\delta_{\xi_0}(h)}^1(\delta_{\xi_0} \varphi_{\eta}(h)) \right) \\
&\leq \bigwedge_{k \in K_1} \bigwedge_{f \in (LX_1)^{\eta}} \left( \tau_1^1(f) \rightarrow \tau_{\delta_{\xi_0}(h)}^1(\delta_{\xi_0} \varphi_{\eta}(f)) \right) \\
&= \text{Open}(\varphi_{\eta}).
\end{align*}

\textbf{Theorem 7.} Let $(X_1, \tau_1)$ and $(X_2, \tau_2)$ be the $L$-fuzzy $(E_1, K_1)$-soft and $L$-fuzzy $(E_2, K_2)$-soft topological spaces. If $\varphi_{\eta}: (X_1, \tau_1) \rightarrow (X_2, \tau_2)$ is a bijective soft mapping, then we have

\textbf{Proof.} (1) Since the soft mapping $\varphi_{\eta}$ is bijective, then $\varphi_{\eta}^{-1}(\varphi_{\eta}(f)) = f$ for each $f \in (LX_1)^{\eta}$ and $\varphi_{\eta}^{-1}(\varphi_{\eta}^{-1}(g)) = g$ for each $g \in (LX_2)^{\eta}$. By considering these facts, we gain the following:

\begin{align*}
\text{Open}(\varphi_{\eta}) &= \bigwedge_{k \in K_1} \bigwedge_{f \in (LX_1)^{\eta}} \left( \tau_1^1(f) \rightarrow \tau_{\delta_{\xi_0}(h)}^1(\varphi_{\eta}(f)) \right) \\
&= \bigwedge_{k \in K_1} \bigwedge_{f \in (LX_1)^{\eta}} \left( \tau_1^1(\varphi_{\eta}(f)) \rightarrow \tau_{\delta_{\xi_0}(h)}^1(\varphi_{\eta}(f)) \right)
\end{align*}

This witnesses the fact that

\begin{align*}
\text{Cont}(\varphi_{\eta}) &= \bigwedge_{k \in K_1} \bigwedge_{f \in (LX_1)^{\eta}} \left( \tau_1^1(f) \rightarrow \tau_{\delta_{\xi_0}(h)}^1(\varphi_{\eta}(f)) \right) \rightarrow \tau_1^1(f).
\end{align*}

(2) It is similarly proved to that of (1).

(3) In order to obtain the proof, we will consider the equalities $(\varphi_{\eta}^{-1})^{-1}(f) = \varphi_{\eta}(f)$ and $(\varphi_{\eta}^{-1})^{-1}(f) = (\varphi_{\eta}^{-1}(f))^\prime$ (by the injectivity property) for each $f \in (LX_1)^{\eta}$. So,

\begin{align*}
\text{Open}(\varphi_{\eta}) &= \bigwedge_{k \in K_1} \bigwedge_{f \in (LX_1)^{\eta}} \left( \tau_1^1(\varphi_{\eta}(f)) \rightarrow \tau_{\delta_{\xi_0}(h)}^1(\varphi_{\eta}(f)) \right) \\
&= \bigwedge_{k \in K_1} \bigwedge_{f \in (LX_1)^{\eta}} \left( \tau_1^1(\varphi_{\eta}(f)) \rightarrow \tau_{\delta_{\xi_0}(h)}^1(\varphi_{\eta}(f)) \right) \rightarrow \tau_1^1(f).
\end{align*}
Open(φψη) = ∩ k∈K1 f∈(Lx1)τ1 (r1k(f)→r2k(φψ(f)))
= ∩ k∈K1 f∈(Lx1)τ1 (r1k(f')→r2k(φψ(f')))
= ∩ k∈K1 f∈(Lx1)τ1 (r1k(f')→r2k(φψ(f')))
= Clos(φψη).

(20)

□

Corollary 2. Let (X1, τ1) and (X2, τ2) be an L-fuzzy (E1, K1)-soft and L-fuzzy (E2, K2)-soft topological spaces, respectively. If φψη: (X1, τ1) → (X2, τ2) is bijective, then the following characterizations are valid:

(1) Hom(φψη) = Cont(φψη)∧ Cont(φψη') = Cont(φψη)∧ Clos(φψη')

(2) Hom(φψη) = ∩ k∈K1 f∈(Lx1)τ1 (r21(k)(φψ(f))→r1k(f))

(3) Hom(φψη) = ∩ k∈K1 f∈(Lx1)τ1 (r21(φψ(g))→r1k(g))

Theorem 8. Let (X1, τ1) and (X2, τ2) be an L-fuzzy (E1, K1)-soft and L-fuzzy (E2, K2)-soft topological spaces, respectively. For any fuzzy soft mapping φψη: (X1, τ1) → (X2, τ2), the following characterizations are satisfied:

(1) Cont(φψη) = ∩ k∈K1 f∈(Lx1)τ1 (φψη(x)(η(k), g)) → (φψη(x)(g))

(2) Cont(φψη) = ∩ k∈K1 f∈(Lx1)τ1 (φψη(x)(η(k), g)) → (φψη(x)(g))

(3) Cont(φψη) = ∩ k∈K1 f∈(Lx1)τ1 (Int2(η(k), g) (φψη(x)) → Int1(k, φψη(g))(x))

(4) Cont(φψη) = ∩ k∈K1 f∈(Lx1)τ1 (Int2(η(k), g) (φψη(x)) → Int1(k, φψη(g))(x))

Proof. (1) By Proposition 1, φψη(x)→h'→g' implies x'=φψη' (h')→φψη(g'). Hence, we may obtain

\[
\bigwedge_{k\in K_1} \bigwedge_{f\in (Lx_1)^{\tau_1}} \bigwedge_{x'\in (Lx_1)^{\tau_1}} \left( (\phi^2_{\eta}(x')(\eta(k), g)) \rightarrow (\phi^1_{x'}(k, \phi^{-1}_x(g))) \right)
\]

(21)

In order to prove the converse, consider the fact that \( r_k(f) = \bigwedge_{x'\in f} \phi^2_{\eta}(k, f) \), for each \( f \in (Lx_1)^{\tau_1} \) and \( k \in K_1 \). Hence, \( x'\in \phi^{-1}_x(g) \) implies \( \phi^2_{\eta}(x') \notin g' \). By these observations, we gain the following:

\[
\text{Cont}(\phi^2_{\eta}) = \bigwedge_{k\in K_1} \bigwedge_{f\in (Lx_1)^{\tau_1}} \left( (\phi^2_{\eta}(k, g)) \rightarrow (\phi^1_{x'}(k, \phi^{-1}_x(g))) \right)
\]

(22)
This completes the proof.
(2) It is similar to that of (1).
(3) and (4) proofs are obtained by using Theorems 1 and 2. □

**Theorem 9.** Let \((X_1, \tau^1)\) and \((X_2, \tau^2)\) be the \(L\)-fuzzy \((E_1, K_1)\)-soft and \(L\)-fuzzy \((E_2, K_2)\)-soft topological spaces. For the fuzzy soft mapping \(\varphi_{\psi, \eta}^*: (X_1, \tau^1) \rightarrow (X_2, \tau^2)\), the following properties are satisfied:

1. Open \((\varphi_{\psi, \eta}^*) = \wedge_{k \in K_1} \wedge_{f \in (L^x)^{f_1}} \wedge_{x \in x^*} (\partial_{\varphi_{\psi, \eta}^*}^2 (k, f) \rightarrow \partial_{\varphi_{\psi, \eta}^*}^2 (\eta(k), g))\)
2. Open \((\varphi_{\psi, \eta}^*) = \wedge_{k \in K_1} \wedge_{f \in (L^x)^{f_1}} \wedge_{x \in x^*} (N_{\varphi_{\psi, \eta}^*} (x^a) \rightarrow N_{\varphi_{\psi, \eta}^*} (\eta(k), \varphi_{\psi, \eta}^* (f))))
3. Open \((\varphi_{\psi, \eta}^*) = \wedge_{k \in K_1} \wedge_{f \in (L^x)^{f_1}} \wedge_{x \in x^*} (\text{Int}^1 (k, f) (x^a) \rightarrow \text{Int}^1 (\eta(k), \varphi_{\psi, \eta}^* (f)) (\varphi_{\psi, \eta}^* (x^a)))

Proof. (5) Let us first consider the following inequality:

\[
\wedge_{k \in K_1} \wedge_{f \in (L^x)^{f_1}} \wedge_{x \in x^*} \left( \partial_{\varphi_{\psi, \eta}^*}^2 (k, \varphi_{\psi, \eta}^* (f)) \rightarrow \partial_{\varphi_{\psi, \eta}^*}^2 (\eta(k), g) \right)
\]

\[
= \wedge_{k \in K_1} \wedge_{f \in (L^x)^{f_1}} \wedge_{x \in x^*} \left( \wedge_{x \in x^*} \left( \bigvee_{x \in x^*} \left( \partial_{\varphi_{\psi, \eta}^*}^2 (k, \varphi_{\psi, \eta}^* (f)) \rightarrow \partial_{\varphi_{\psi, \eta}^*}^2 (\eta(k), g) \right) \right) \right)
\]

\[
= \wedge_{k \in K_1} \wedge_{f \in (L^x)^{f_1}} \wedge_{x \in x^*} \left( \wedge_{x \in x^*} \left( \bigvee_{x \in x^*} \left( \partial_{\varphi_{\psi, \eta}^*}^2 (k, \varphi_{\psi, \eta}^* (f)) \rightarrow \partial_{\varphi_{\psi, \eta}^*}^2 (\eta(k), g) \right) \right) \right)
\]

\[
= \wedge_{k \in K_1} \wedge_{f \in (L^x)^{f_1}} \wedge_{x \in x^*} \left( \partial_{\varphi_{\psi, \eta}^*}^2 (k, \varphi_{\psi, \eta}^* (f)) \rightarrow \partial_{\varphi_{\psi, \eta}^*}^2 (\eta(k), g) \right)
\]

In order to obtain the converse inequality, we will use the following fact:

\[
\wedge_{x \in x^*} \partial_{\varphi_{\psi, \eta}^*}^2 (\eta(k), \varphi_{\psi, \eta}^* (f)) = \wedge_{x \in x^*} \partial_{\varphi_{\psi, \eta}^*}^2 (\eta(k), \varphi_{\psi, \eta}^* (f)).
\]

(24)

We may also consider

\[
\wedge_{k \in K_1} \wedge_{f \in (L^x)^{f_1}} \left( \wedge_{x \in x^*} \left( \bigvee_{x \in x^*} \left( \partial_{\varphi_{\psi, \eta}^*}^2 (k, \varphi_{\psi, \eta}^* (f)) \rightarrow \partial_{\varphi_{\psi, \eta}^*}^2 (\eta(k), g) \right) \right) \right)
\]

\[
= \wedge_{k \in K_1} \wedge_{f \in (L^x)^{f_1}} \left( \wedge_{x \in x^*} \left( \bigvee_{x \in x^*} \left( \partial_{\varphi_{\psi, \eta}^*}^2 (k, \varphi_{\psi, \eta}^* (f)) \rightarrow \partial_{\varphi_{\psi, \eta}^*}^2 (\eta(k), g) \right) \right) \right)
\]

Now, let us choose an arbitrary \(y \in M(L)\) which satisfies

\[
\gamma \wedge_{k \in K_1} \wedge_{f \in (L^x)^{f_1}} \wedge_{x \in x^*} \left( \partial_{\varphi_{\psi, \eta}^*}^2 (k, \varphi_{\psi, \eta}^* (f)) \rightarrow \partial_{\varphi_{\psi, \eta}^*}^2 (\eta(k), g) \right).
\]

(26)

Therefore, \(\gamma \leq (\partial_{\varphi_{\psi, \eta}^*}^2 (k, \varphi_{\psi, \eta}^* (f)) \rightarrow \partial_{\varphi_{\psi, \eta}^*}^2 (\eta(k), g))\) is satisfied for all \(k \in K_1, g \in (L^x)^{f_2}\) and for all \(x^a \in M ((L^x)^{f_1})\). By the implication operator properties, we get \(\gamma \wedge (\partial_{\varphi_{\psi, \eta}^*}^2 (k, \varphi_{\psi, \eta}^* (f)) \leq (\partial_{\varphi_{\psi, \eta}^*}^2 (\eta(k), g))\). For all \(f \in (L^x)^{f_1}\), with \(\varphi_{\psi, \eta}^* (x^a) \varphi_{\psi, \eta}^* (f), \) we obtain \(\alpha (e) \leq \varphi_{\psi, \eta}^* (f) \varphi_{\psi, \eta}^* (f (x^a))\). Then, there exist \(z \in X\) and \(e^* \in E\) such that \(\varphi (x) = \varphi (z)\).
and \( \psi(e) = \psi(e^*) \) and also \( a(e^*) \leq f_\nu(z) \). This implies \( z^\nu \leq f_\nu \). From

\[
\gamma \land \left( (k, \varphi^{-1}_v(\psi(f))) \right) \\
\leq \gamma \land \left( (k, \varphi^{-1}_v(\psi(f))) \right) \\
\leq \left( \varphi^{-1}_v(z) \eta(k), \varphi^{-1}_v(f) \right) = \varphi^{-1}_v(x^{\nu}) \eta(k), \varphi^{-1}_v(f),
\]

we gain \( \gamma \land \left( (k, \varphi^{-1}_v(\psi(f))) \right) \leq \gamma \land \left( (k, \varphi^{-1}_v(\psi(f))) \right) \) \( \varphi^{-1}_v(x^{\nu}) \eta(k), \varphi^{-1}_v(f) \). So we get \( \gamma \leq \left( \varphi^{-1}_v(x^{\nu}) \varphi^{-1}_v(f) \right) \) \( \varphi^{-1}_v(x^{\nu}) \eta(k), \varphi^{-1}_v(f) \).

Since the arbitrariness of \( \gamma \), we gain

\[
\bigwedge_{k \in K_1} \bigwedge_{f \in (L^X)^E} \left( \bigwedge_{x^{\nu} \in f} \varphi^{-1}_v(k, \varphi^{-1}_v(\psi(f))) \bigwedge_{\psi(\varphi^{-1}_v(x^{\nu}))} \varphi^{-1}_v(x^{\nu}) \eta(k), \varphi^{-1}_v(f) \right)
\]

\[
\geq \bigwedge_{k \in K_1} \bigwedge_{g \in (L^X)^E} \bigwedge_{x^{\nu} \in M} \left( \bigwedge_{x^{\nu} \in f} \varphi^{-1}_v(k, \varphi^{-1}_v(\psi(f))) \bigwedge_{\psi(\varphi^{-1}_v(x^{\nu}))} \varphi^{-1}_v(x^{\nu}) \eta(k), \varphi^{-1}_v(f) \right)
\]

Hence we obtain the desired result.

By using Theorems 1 and 2, and also by considering some similar discussion, one can prove the other claims of the theorem.

\[\Box\]

**Theorem 10.** Let \((X_1, \tau^1)\) and \((X_2, \tau^2)\) be the \(L\)-fuzzy \((E_1, K_1)\)-soft and \(L\)-fuzzy \((E_2, K_2)\)-soft topological spaces. For the fuzzy soft mapping \(\varphi_{\psi, \eta}: (X_1, \tau^1) \rightarrow (X_2, \tau^2)\), we have the following result:

\[
\beta \circ \text{Cont}(k, \varphi_{\psi, \eta}) = \bigwedge_{g \in (L^X)^E} \bigwedge_{x \in M} \left( \bigwedge_{x^E \in f} \left( \varphi^{-1}_v(\psi(f)(x)) \right) \bigwedge_{y \in (L^X)^E} \left( \varphi^{-1}_v(\psi(f)(y)) \right) \right)
\]

\[
\beta \circ \text{com}_\tau (k, f) = \bigwedge_{g \in (L^X)^E} \bigwedge_{x \in M} \left( \bigwedge_{x^E \in f} \left( \varphi^{-1}_v(\psi(f)(x)) \right) \bigwedge_{y \in (L^X)^E} \left( \varphi^{-1}_v(\psi(f)(y)) \right) \right)
\]

for all \(k \in K_1\) and \(f \in (L^X)^E_1\).

\[\Box\]

**Proof.** Let us choose an arbitrary \( \beta \in M(L) \) such that 

\( \beta \circ \left( \text{com}_\tau(k, f) \text{Cont}(k, \varphi_{\psi, \eta}) \right) \). By the below wedge operation property, we have that

\[
\beta \circ \left( \text{com}_\tau(k, f) \text{Cont}(k, \varphi_{\psi, \eta}) \right) \Rightarrow \text{com}_\tau(k, f) \text{Cont}(k, \varphi_{\psi, \eta}) \Rightarrow \text{com}_\tau(k, f) \text{Cont}(k, \varphi_{\psi, \eta})
\]
Hence for any $g \in (L^X)^{E_1}$ and for any $\mathcal{U} \subseteq (L^X)^{E_1}$, we gain

\[
\beta \leq \left( \tau_{\eta(k)}^{2}(g) \right) \rightarrow \tau_{\phi_{\eta}^{-1}}(g)),
\]

\[
\beta \leq \left( \bigwedge_{g \in \mathcal{U}} \bigwedge_{x \in X_1 \forall \mathcal{E}_1} \left( f^{(x)}_e \vee g_e(x) \right) \right) \rightarrow \bigvee_{\tau \in 2^{(U)}} \bigwedge_{x \in X_1 \forall \mathcal{E}_1} \left( f^{(x)}_e \vee g_e(x) \right).
\]

(33)

By considering the implication properties, we have

\[
\beta \land \tau_{\eta(k)}^{2}(g) \leq \tau_{\phi_{\eta}^{-1}}(g)), \text{ for any } g \in (L^X)^{E_1},
\]

\[
\beta \land \left( \bigwedge_{g \in \mathcal{U}} \bigwedge_{x \in X_1 \forall \mathcal{E}_1} \left( f^{(x)}_e \vee g_e(x) \right) \right) \leq \bigvee_{\tau \in 2^{(U)}} \bigwedge_{x \in X_1 \forall \mathcal{E}_1} \left( f^{(x)}_e \vee g_e(x) \right).
\]

(34)

In order to complete the proof, it is necessary to show that

\[
\beta \leq \text{com}_{f_\tau}(\eta(k), \varphi_{\eta}(f))
\]

\[
= \bigwedge_{g \in \mathcal{U}} \left( \bigwedge_{g \in \mathcal{U}} \bigwedge_{y \in X_1 \forall \mathcal{E}_1} \left( \varphi_{\eta}(f)_e \land (y) \lor \bigwedge_{g \in \mathcal{U}} \left( \varphi_{\eta}(f)_e \land (y) \lor \bigvee_{w \in \mathcal{U}} w_e(y) \right) \right) \right) \rightarrow \bigvee_{\tau \in 2^{(U)}} \bigwedge_{x \in X_1 \forall \mathcal{E}_1} \left( \varphi_{\eta}(f)_e \land (y) \lor \bigwedge_{g \in \mathcal{U}} \left( \varphi_{\eta}(f)_e \land (y) \lor \bigvee_{w \in \mathcal{U}} w_e(y) \right) \right).
\]

(35)

Let $\varphi_{\eta}^{-1}(\mathcal{U}) = \{ \varphi_{\eta}^{-1}(w) | w \in \mathcal{U} \} \subseteq (L^X)^{E_1}$. Hence, we have the following facts:

\[
\beta \land \left( \bigwedge_{g \in \mathcal{U}} \bigwedge_{x \in X_1 \forall \mathcal{E}_1} \left( \varphi_{\eta}(f)_e \land (y) \lor \bigwedge_{g \in \mathcal{U}} \left( \varphi_{\eta}(f)_e \land (y) \lor \bigvee_{w \in \mathcal{U}} w_e(y) \right) \right) \right) \rightarrow \bigvee_{\tau \in 2^{(U)}} \bigwedge_{x \in X_1 \forall \mathcal{E}_1} \left( f^{(x)}_e \lor g_e(x) \right).
\]

(36)
From the implication operator properties, we get

$$
\beta \leq \left( \bigwedge_{w \in W} \left( \bigwedge_{y \in X_{2}} \left( \left( \bigwedge_{e \in E_{2}} \left( \varphi_{\psi} (f)_{e} (y) \vee \bigwedge_{w_{e} (y)} \right) \right) \right) \right) \right) \rightarrow \bigvee_{\gamma \in Z} \left( \bigwedge_{y \in X_{2}} \left( \left( \bigwedge_{e \in E_{2}} \left( \varphi_{\psi} (f)_{e} (y) \vee \bigwedge_{w_{e} (y)} \right) \right) \right) \right).
$$

Therefore, we obtain the following:

$$
\beta \leq \bigwedge_{\eta \in \mathcal{L}_{X_{2}}} \left( \left( \bigwedge_{u \in W} \left( \left( \bigwedge_{y \in X_{2}} \left( \left( \bigwedge_{w_{e} (y)} \right) \right) \right) \right) \right) \right).
$$

This witnesses the desired fact $\beta \leq \text{com}_{\varphi \psi} (\eta (k), \varphi_{\psi} (f))$. □

**Corollary 3.** Let $(X_{1}, \mathcal{I}_{1})$ and $(X_{2}, \mathcal{I}_{2})$ be the $L$-fuzzy $(E_{1}, K_{1})$-soft and $L$-fuzzy $(E_{2}, K_{2})$-soft topological spaces. If the fuzzy soft mapping $\varphi_{\psi} : (X_{1}, \mathcal{I}_{1}) \rightarrow (X_{2}, \mathcal{I}_{2})$ is subjective, then we have that $\text{com}_{\varphi \psi} (\eta (k), \varphi_{\psi} (f)) \leq \text{com}_{\varphi \psi} (\eta (k), \mathcal{I}_{X_{2}})$.

$$
\beta \leq \bigwedge_{\eta \in \mathcal{L}_{X_{2}}} \left( \left( \bigwedge_{u \in W} \left( \left( \bigwedge_{y \in X_{2}} \left( \left( \bigwedge_{w_{e} (y)} \right) \right) \right) \right) \right) \right).
$$

Theorem 11. Let $(X_{1}, \mathcal{I}_{1})$ and $(X_{2}, \mathcal{I}_{2})$ be the $L$-fuzzy $(E_{1}, K_{1})$-soft and $L$-fuzzy $(E_{2}, K_{2})$-soft topological spaces. For the fuzzy soft mapping $\varphi_{\psi} : (X_{1}, \mathcal{I}_{1}) \rightarrow (X_{2}, \mathcal{I}_{2})$, we have

$$
\text{Con} (\eta (k), \varphi_{\psi} (f)) \wedge \text{Cont} (k, \varphi_{\psi}) \leq \text{Con} (k, f).
$$

Proof. Let us choose an arbitrary $\beta \in M(L)$ such that $\beta \leq \text{Con} (\eta (k), \varphi_{\psi} (f))$. By Theorems 3 and 4, the following implications are obtained:

$$
\beta \leq \text{Cont} (k, \varphi_{\psi})
$$

Hence, there exists $u, v \in (L^{X_{2}})^{E_{2}}$ which satisfy the conditions $\varphi_{\psi} (f) \cap u \neq 0$, $\varphi_{\psi} (f) \cap v \neq 0$, $\varphi_{\psi} (f) \cap u \cap v = 0$, and $\varphi_{\psi} (f) \not\subseteq u \cup v$ such that $\beta \leq (\tau_{\varphi_{\psi}} (u) \cap \tau_{\varphi_{\psi}} (v))$ and also $\beta \leq (\tau_{\varphi_{\psi}} (h) \cap \tau_{\varphi_{\psi}} (h))$, for each $h \in (L^{X_{2}})^{E_{2}}$. That is, there exists $u, v \in (L^{X_{2}})^{E_{2}}$ satisfying

$$
\beta = \beta \cap \tau_{\varphi_{\psi}} (u) \cap \tau_{\varphi_{\psi}} (v) \leq \tau_{\varphi_{\psi}} (u) \cap \tau_{\varphi_{\psi}} (v)
$$

$$
\leq \text{Con} (k, f).
$$

Since the coprime element $\beta$ is arbitrary, we gain the desired inequality for the parameter $k$, $\text{Con} (\eta (k), \varphi_{\psi} (f)) \wedge \text{Cont} (k, \varphi_{\psi}) \leq \text{Con} (k, f)$.

**4. Conclusion**

As it is well known, in real life, nothing is described with the help of the 2-valued logic since there is no only black and white in nature. But the idea of fuzzy thinking, which gives some degrees to the phenomena reflect the facts more correctly. In the topological point of view, fuzzy logic, which is also related with quantum mechanics, was applied to the gradation of belongingness and it gave birth to the fuzzy topology. On the other side, the soft set theory which emphasizes the importance/necessity of the parametrization tool for adequate mathematical modeling of the natural facts is one of the preferred tools by the researchers [13, 23–26]. Besides, the combination of these types of sets, named as fuzzy soft set, is one of the adequate tools for modeling. In this respect, we deal with the gradation of the continuity of mappings between fuzzy soft topological spaces (here both of the sets and the axioms of the structure are all fuzzy soft). Since the mappings play the main role to establish the relations between structured sets, the idea proposed here helps
us to obtain more appropriate and compatible results in such spaces. Despite the theoretical benefits of this method, it is not easy to find numerical examples in application. But this could be overcome by taking a unit interval instead of a lattice.

In relation with the research in this study, notice that soft continuity seems to be the natural tool to prove results more similar to Weierstrass’s celebrated theorem. For further research, we hope to investigate this idea and try to find reasonable results. Furthermore, we hope to extend the proposed methods to Pythagorean fuzzy uncertain environments [27] as an additional research.
