ABSTRACT

In this paper, we will be delving deeper into the connection between the rough theory and the ring theory precisely in the principle and maximal ideal. The rough set theory has shown by Pawlak as good formal tool for modeling and processing incomplete information in information system. The rough theory is based on two concepts the upper approximation of a given set is the union of all the equivalence classes, which are subsets of the set, and the lower approximation is the union of all the equivalence classes, which are intersection with set non-empty. Many researchers develop this theory and use it in many areas. Here, we will apply this theorem in the one of the most important branches of mathematics that is ring theory. We will try to find the rough principal and maximal ideal as an extension of the notion of a principal maximal ideal respectively in ring theory. In addition, we study the properties of the upper and lower approximation of a principal maximal ideal. However, some researchers use the rough theory in the group and ring theory. Our work, is Shaw there are rough maximal and principle ideal as an extension of the maximal and principle ideal respectively. Our result will introduce the rough maximal ideal as an extended notion of a classic maximal ideal and we study some properties of the lower and the upper approximations a maximal ideal.

INTRODUCTION

The rough set theory has shown by Pawlak [1] in 1982. It is a good formal tool for modeling and processing incomplete information in information system. In recently 40 years, some researchers develop this theory and use it in many areas. The upper approximation of a given set is the union of all the equivalence classes, which are subsets of the set, and the lower approximation is the union of all the equivalence classes, which are intersection with set non-empty. Many researchers develop and use the rough theory in the group and ring theory. For example, the notation of rough subring with respect ideal has presented by B. Davvaz [2]. Algebraic properties of rough sets have been studied by Bonikowski [3]. John N. Mordeson [4], has used covers of the universal set to defined approximation operators on the power set of the given set. Some concept lattice in Rough set theory has studied by Y.Y. Yao [5]. Ronnason Chinram, [6] studies rough prime ideas and Rough fuzzy prime ideals in gamma-semigroups. Some other substitute an algebraic
structure instead of the universe set. Like Biswas and Nanda [7], they make some notions of rough subgroups. Kuroki in [8], introduced the notion of a rough ideal in a semi group. Some properties of the Also, Kuroki and Mordeson in [9] studied the structure of rough sets and rough groups. S. B Hosseinin [10], he introduced and discussed the concept of T-rough (prime, primary) ideal and T-rough fuzzy (prime, primary) ideal in a commutative ring. In addition, B. Davvaz [11] applied the concept of approximation spaces in the theory of algebraic hyperstructures, and in investigated the similarity between rough membership functions and conditional probability. In this paper, we shall introduce the maximal ideal. Our result will introduce the rough maximal ideal as an extended notion of a classic maximal ideal and we study some properties of the lower and the upper approximations a maximal ideal.

PRELIMINARIES

Suppose that $U$ (universe) be a nonempty finite set. Let $R$ an equivalence relation (reflexive, symmetric, and transitive) on an $U$. Some authors say $R$ is indiscernibility relation. The discernibility relation represents our lack of knowledge about elements of $U$. For simplicity, they assume $R$ an equivalence relation. We use $U/R$ to denote the family of all equivalent classes of $R$ (or classifications of $U$), and we use $[x]_R$ to denote an equivalence class in $R$ containing an element $x \in U$. The pair $(U, R)$ is called an approximation space. The empty set $\emptyset$ and the elements of $U/R$ are called elementary sets. For any $X \subseteq U$, we write $\overline{X}$ to denote the complementation of $X$ in $U$.

Definition 2.1: For an approximation space $(U, R)$, we define the upper approximation of $X$ by $\overline{RX} = \{ x \in U : [x]_R \cap X \neq \emptyset \}$; i.e. $\overline{RX}$ the set of all objects which can be with certainty classified as members of $X$ with respect to $R$ is called the $R$-upper approximation of a set $X$ with respect to $R$.

Definition 2.2: For an approximation space $(U, R)$, we define the boundary region by $BX_R = \overline{RX} - RX$. i.e. $BX_R$ is the set of all objects which can be decisively classified neither as members of $X$ nor as the members of $X^c$ with respect to $R$. If $BX_R = \emptyset$, we say $X$ is exact (crisp) set. But if $BX_R \neq \emptyset$, we say $X$ Rough set (inexact). We have Properties of approximations as:

1. $RX \subseteq X \subseteq \overline{RX}$
2. $R\emptyset = \overline{R\emptyset}, RU = \overline{RU}$,
3. $R(X \cup Y) \supseteq R(X) \cup R(Y)$,
4. $R(X \cap Y) = R(X) \cap R(Y)$,
5. $R(X \cup Y) = \overline{R(X) \cup R(Y)}$,
6. $R(X \cap Y) \subseteq \overline{R(X) \cap R(Y)}$,
7. $RX^c = (RX)^c$
8. $RX^c = (\overline{RX})^c$
9. $R(RX) = \overline{RX}$
10. $(R(RX) = \overline{RX}) = RX$

Example 2.1: Let us consider set of objects $U = \{ x_1, x_2, x_3, x_4, x_5, x_7 \}$, and the Equivalence relation $R = \{ [x_1], [x_2], [x_3, x_4], [x_5, x_7], [x_6] \}$, and let $X = \{ x_1, x_4, x_5 \}$. Now, the upper approximations of $X$: $\overline{RX} = \{ x \in U : [x]_R \cap X \neq \emptyset \}$. So $\overline{RX} = \{ x_1, x_3, x_4, x_5 \}$ and the lower approximation of $X$: $RX = \{ x \in U : [x]_R \subseteq X \}$. So $RX = \{ x_1, x_5 \}$. The boundary region by $BX_R = \overline{RX} - RX$. So, $BX_R = \{ x_3, x_4 \}$. Then $BX_R \neq \emptyset$, so $X$ is Rough set.

Now, we define the ideal and maximal idea. Then we will study the upper and lower approximations ideal. We suppose we have a ring $R$ and $I$ be an Ideal of a ring $R$, and $X$ be a non-empty subset of $R$.

Definition 2.3: Let $I$ be an Ideal of $R$; For $a,b \in R$ we say $a$ is congruent of $b$ mod $I$, we express this fact in symbols as $a \equiv b$(mod $l$)if $a - b \in I$ .................(1)

Not that, it easy to see the relation (1) is an equivalents relation. Therefore, when we let $U = R$ and we suppose a relation $R$ is the equivalents relation (1),
so we can defined the upper and lower approximation of $X$ with respect of $I$ as $\overline{I(X)} = \bigcup \{ x \in \mathcal{R} : (x + I) \cap X \neq \emptyset \}$, $\underline{I(X)} = \bigcup \{ x \in \mathcal{R} : x + I \subseteq X \}$, respectively. Moreover, the boundary of $X$ with respect of $I$ is $BX = \overline{I(X)} - \underline{I(X)}$. If $BX = \emptyset$ we say $X$ is Rough set with respect $I$. For any approximation space $(U,R)$ by rough approximation on $(U,R)$, we mean a mapping $\text{Apr}(X) : p(U) \rightarrow p(U) \times p(U)$ defined by for all $x \in p(U)$, $\text{Apr}(X) = (\overline{I(X)}, \underline{I(X)})$, where $\overline{I(X)} = \{ x \in \mathcal{R} : (x + I) \cap X \neq \emptyset \}$, $\underline{I(X)} = \{ x \in \mathcal{R} : x + I \subseteq X \}$.

**Definition 2.4:** An ideal $M$ in a ring $\mathcal{R}$ we called maximal if $M \neq \mathcal{R}$ and the only ideal strictly containing $M$ is $\mathcal{R}$.

**Definitions 2.5:** Let $\mathcal{R}$ be a commutative ring with identity. Let $S$ be a subset of $\mathcal{R}$. The ideal generated by $S$ is the subset $<S> = \{ r_1 s_1 + r_2 s_2 + ... + r_n s_n : r_1, r_2, ..., s_1, s_2, ..., s_k \in S, k \in \mathbb{N} \}$. In particular, if $S$ has a single element $s$ this is called the principal ideal generated by $s$. That is, $<s> = \{ rs : r \in \mathcal{R} \}$.

**Examples 2.2:** The ideal 2 $\mathbb{Z}$ of $\mathbb{Z}$ is the principal ideal $<2>$.

**Examples 2.3:** In $\mathbb{Z}$, the ideal $<5>$ is maximal. For suppose that $I$ is an ideal of $\mathbb{Z}$ properly containing $<5>$. Then there exists some $m \in I$ with $m \notin <5>$, i.e., 5 does not divide $m$. Then $\gcd(5, m) = 1$ since 5 is prime, and we can write $1 = 5x + my$ for integers $x$ and $y$. Since $5x \in I$ and $my \in I$, this means $1 \in I$. Then $I = \mathbb{Z}$, and $<5>$ is a maximal ideal in $\mathbb{Z}$. Note that the maximal ideals in $\mathbb{Z}$ are precisely the ideals of the form $<p>$, where $p$ is prime.

**Proposition 1.4** Let $\mathcal{R}$ be a commutative ring with identity. Then every maximal ideal of $\mathcal{R}$ is prime.

**Example 2.4.** For $\mathcal{R} = \mathbb{Z}_{12}$, two maximal ideals are $M_1 = \{ 0, 2, 4, 6, 8, 10 \}$ and $M_2 = \{ 0, 3, 6, 9 \}$. Two other ideals, which are not maximal are $\{ 0, 4, 8 \}$ and $\{ 0, 6 \}$.

### UPPER AND LOWER MAXIMAL IDEALS

In this section, we introduce the maximal ideal and we study some properties of upper and lower maximal ideal. Let consider the example2-4:

**Example 3.1.** Let consider the example2-4 $\mathcal{R} = \mathbb{Z}_{12}$, $M = \{ 0, 3, 6, 9 \}$. $X = \{ 1, 2, 6, 7, 9 \}$. For $x \in \mathcal{R} : x + M$, we get $\{ 0, 3, 6, 9 \}$, $\{ 1, 4, 7, 10 \}$, $\{ 2, 5, 8, 11 \}$. Now, the upper approximations of $X$ with respect of $M$ : $\overline{M(X)} = \bigcup \{ x \in \mathcal{R} : (x + M) \cap X \neq \emptyset \} = \{ 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 \}$ and lower approximation of $X$ with respect of $M$ : $\underline{M(X)} = \bigcup \{ x \in \mathcal{R} : x + M \subseteq X \}$, So, $\overline{I(X)} = \emptyset$ because no element satisfy the definition of $\overline{M(X)}$. Moreover, $BX = \overline{I(X)} - \underline{I(X)} = \{ 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 \}$. Then $X$ is rough set with respect $M$.

**Example 3.2.** Let us consider the ring $\mathcal{R} = \mathbb{Z}_6$. Suppose let maximal ideals is $M = \{ 0, 2, 4 \}$ and $X = \{ 1, 2, 3, 4, 5 \}$. For $x \in \mathcal{R} : x + M$, we get $\{ 0, 2, 4 \}$, $\{ 1, 3, 5 \}$. The upper approximations of $X$ with respect of $M$ : $\{ 0, 2, 4 \} \cup \{ 1, 3, 5 \}$, so, $\overline{M(X)} = \{ 0, 1, 2, 3, 4, 5 \}$ and the lower approximation of $X$ with respect of $M$ : $\underline{M(X)} = \{ 1, 3, 5 \}$, $BX = \overline{M(X)} - \underline{M(X)} = \{ 0, 2, 4 \}$. Then $X$ is rough set with respect maximal ideal $M$.

We can study the properties of maximal ideal in next proposition:

**Proposition 3.1:** For every approximation $(\mathcal{R}, M)$ and Every subset $A, B \subseteq \mathcal{R}$ we have:

1) $\overline{M(A)} \subseteq A \subseteq \overline{M(A)}$;

2) $\overline{M(\emptyset)} = \emptyset = \overline{M(\emptyset)}$;

3) $\overline{M(\mathcal{R})} = \mathcal{R} = \overline{I(\mathcal{R})}$;

4) $\overline{M(A \cap B)} = \overline{M(A)} \cap \overline{M(B)}$;

5) $\overline{M(A \cup B)} = \overline{M(A)} \cup \overline{M(B)}$;

6) If $A \subseteq B$, then $\overline{M(A)} \subseteq \overline{M(B)}$, and $\overline{M(A)} \subseteq \overline{M(B)}$;

7) $\overline{M(A \cup B)} \subseteq \overline{M(A)} \cup \overline{M(B)}$;

8) $\overline{M(A \cap B)} \subseteq \overline{M(A)} \cap \overline{M(B)}$;

9) $\overline{M(A)} = (\overline{M(A^c)}^c$;

10) $\overline{M(A)} = (\overline{M(A^c)}^c$;

11) $\overline{M(I(A))} = \overline{M(M(A))} = \overline{M(A)}$;

12) $\overline{M(M(A))} = (\overline{M(A)} = \overline{M(A)}$. 

---

*Abdunanbi, Faraj. Alq J Med App Sci. 2021;4(1):7-11*
Proof:
1) If \( x \in M(A) \), then \( x \in M(A) = \{ x \in \mathcal{R} : x + M \subseteq A \} \), then \( x \in A \), Hence \( M(A) \subseteq A \), next if \( x \in A \), \( M(A) = \{ x \in \mathcal{R} : (x + M) \cap A \neq \emptyset \} \), then \( x \in M(A) \) then \( A \subseteq M(A) \).
2) And 3) it easy to see that.
4) If \( x \in M(A \cap B) \), then \( x \in M(A \cap B) = \{ x \in \mathcal{R} : x + M \subseteq A \cap B \} \), then \( x \in A \cap B \), and \( x + MB \), then \( x \in M(A) \cap M(B) \).
5) It says way in 4)
6) Since \( A \subseteq B \), then \( A \cap B = A \), by 4) then \( M(A) \cap M(B) \); It implies \( M(A) \subseteq M(B) \), also by 5) we get \( M(A) \subseteq M(B) \).
7) Since \( A \subseteq A \cup B \), \( B \subseteq A \cup B \), by 6) we get \( M(A) \subseteq M(A \cup B) \), and \( M(B) \subseteq M(A \cup B) \); which yields \( M(A \cup B) \supseteq M(A) \cup M(B) \).
8) It says way in 7)
9) -13) it is easy to see that by using of definition of upper and lower approximations of \( A \) with respect \( M \).

**UPPER AND LOWER PRINCIPAL IDEAL:**

**Example 4.1.** Let us consider the ring \( \mathcal{R} = \mathbb{Z}_6 \), \( J = \{0, 2, 4\} \) and \( X = \{1, 2, 3, 4, 5\} \). For \( x \in \mathcal{R} : x + J \), we get \( \{0, 2, 4\}, \{1, 3, 5\} \). The upper approximations of \( X \) with respect of \( J \): \( \{0, 2, 4\} \cup \{1, 3, 5\} \), so, \( \bar{J}(X) = \{0, 1, 2, 3, 4, 5\} \). And the lower approximation of \( X \) with respect of \( J \): \( \bar{J}(X) = \{1, 3, 5\} \), \( BX = \bar{J}(X) - \bar{J}(X) = \{0, 2, 4\} \). Then \( X \) is rough set with respect \( J \).

**Proposition 4-1:** suppose \( \mathcal{R} \) commutative ring and \( I \) principle ideal. For every approximation \((\mathcal{R}, I)\) w and Every subset \( A, B \subseteq \mathcal{R} \) we have:
1) \( \bar{I}(A) \subseteq A \subseteq \bar{I}(A) \);
2) \( \bar{I}(\emptyset) = \emptyset = \bar{I}(\emptyset) \);
3) \( \bar{I}(\mathcal{R}) = \mathcal{R} = \bar{I}(\mathcal{R}) \);
4) \( \bar{I}(A \cap B) = \bar{I}(A) \cap \bar{I}(B) \);
5) \( \bar{I}(A \cup B) = \bar{I}(A) \cup \bar{I}(B) \);
6) If \( A \subseteq B \), then \( \bar{I}(A) \subseteq \bar{I}(B), \) and \( \bar{I}(A) \subseteq \bar{I}(B) \);
7) \( \bar{I}(A \cup B) \supseteq \bar{I}(A) \cup \bar{I}(B) \);
8) \( \bar{I}(A \cap B) \subseteq \bar{I}(A) \cap \bar{I}(B) \);
9) \( \bar{I}(A) = (\bar{I}(A))^c \);
10) \( \bar{I}(A) = (\bar{I}(A))^c \);
11) \( \bar{I}(I(A)) = \bar{I}(I(A)) = \bar{I}(A) \);
12) \( \bar{I}(\bar{I}(A)) = \bar{I}(I(A)) = \bar{I}(A) \);
13) \( \bar{I}(x + I) = \bar{I}(x + I) \) for all \( x \in \mathcal{R} \).

**Definition 4.1.** If \( A \) and \( B \) are an increasing subset of \( \mathcal{R} \), we denote \( AB \) for the set of all finite sums \( \{ a \cdot b : a, b \neq \emptyset \} \), \( a \in A, b \in B \). i.e. \( AB = \sum_{n=1}^{n} (a_i \cdot b_i), a_i \in A, b_i \in B \).

**Proposition 4-2:** Let \( I \) be maximal or principal Ideal \( \mathcal{R} \), and \( A, B \) are non-empty subset of the ring \( \mathcal{R} \), then
1) \( \bar{I}(A) + \bar{I}(B) = \bar{I}(A + B) \);
2) \( \bar{I}(A, B) = \bar{I}(A) \cap \bar{I}(B) \);
3) \( \bar{I}(A) + \bar{I}(B) \subseteq \bar{I}(A + B) \);
4) \( \bar{I}(A, B) \supseteq \bar{I}(A) \cap \bar{I}(B) \).

**Proof**
1) We need to prove \( \bar{I}(A + B) \subseteq \bar{I}(A) + \bar{I}(B) \) and \( \bar{I}(A + B) \supseteq \bar{I}(A) + \bar{I}(B) \). So, suppose \( x \in \bar{I}(A + B) \), by definition of upper approximation of \( A + B \) with respect \( I \), \( (x + I) \cap (A + B) \neq \emptyset \). Hence there exists \( s \in (x + I) \) and \( y \in A + B \), also \( s = \sum_{i=1}^{n} a_i + b_i \) for some \( a_i \in A, b_i \in B \). we have, \( x \in s + I = \sum_{i=1}^{n} (a_i + b_i) + I = \sum_{i=1}^{n} (a_i + I) + (b_i + I) \). Then there exist \( x \in (a_i + I) \) and \( s_i \in (b_i + I) \) such that \( x = \sum_{i=1}^{n} x_i + s_i \). So, \( x \in \bar{I}(A) \) and \( x \in \bar{I}(B) \). Because, \( a_i \in (x_i + I) \cap A \) and \( b_i \in (s_i + I) \cap B \). Then, \( \bar{I}(A + B) \subseteq \bar{I}(A) + \bar{I}(B) \).

The other side, we suppose \( x \in \bar{I}(A) + \bar{I}(B) \), then
\( x = \sum_{i=1}^{n} a_i + b_i \) for some \( x_i \in \bar{I}(A) \) and \( s_i \in \bar{I}(B) \). Hence, \( (a_i + I) \cap A \neq \emptyset \) and \( s_i \in \bar{I}(B) \). So, \( x \in \bar{I}(A + B) \).

Also, \( \sum_{i=1}^{n} x_i + s_i \in A + B \) and \( \sum_{i=1}^{n} x_i + s_i \in \bar{I}(A + B) \neq \emptyset \), that mean \( x \in \bar{I}(A + B) \), so, \( \bar{I}(A + B) \supseteq \bar{I}(A) + \bar{I}(B) \).

2) Similar 1) by using definition of \( AB \).
3) & 4) Similar way in (1)&(2) by using definition of lower approximation.

**Example 4.3.** Let consider the ring $\mathbb{R} = \mathbb{Z}_6$, $I = \{0, 2, 4\}$ and $A = \{1, 2, 3, 4, 5\}$, $B = \{0, 1, 2, 4\}$, then $AB = \sum_{i=1}^{n} (a_i \cdot b_i)$, $a_i \in A$, $b_i \in B$. AB = $\{0, 1, 2, 3, 4, 5\}$.

We get $\overline{I(A)} = \{0, 1, 2, 3, 4, 5\}$. In addition, $\overline{I(B)} = \{0, 1, 2, 3, 4, 5\}$.

Then $\overline{I(A \cdot B)} = \{0, 1, 2, 3, 4, 5\}$.

However, $\overline{I(A)} \cdot \overline{I(B)} = \{0, 1, 2, 3, 4, 5\}$.

Then $\overline{I(A \cdot B)} = \overline{I(A)} \cdot \overline{I(B)} \cdot \overline{I(A)} = \{1, 3, 5\}$, $\overline{I(B)} = \{0, 2, 4\}$, $\overline{I(A \cdot B)} = \{0, 1, 2, 3, 4, 5\}$, $\overline{I(A)} \cdot \overline{I(B)} = \{0, 2, 4\}$.

So, $\overline{I(A \cdot B)} \subset \overline{I(A)} \cdot \overline{I(B)}$.

**CONCLUSION**

In this paper, we find there exists rough maximal ideal and principle that will be as an extension of the notion of a maximal ideal and principle ideal respectively.
