Selecting Core Outcomes for Randomised Effectiveness trials In Type 2 diabetes (SCORE-IT): a patient and healthcare professional consensus on a core outcome set for type 2 diabetes

Nicola L Harman,1 John P H Wilding,2 Dave Curry,3 James Harris,3 Jennifer Logue,4 R John Pemberton,3 Leigh Perreault,5,6 Gareth Thompson,3 Sean Tunis,7 Paula R Williamson,1 on behalf of the SCORE-IT Study Team

ABSTRACT

Objectives Heterogeneity in outcomes measured across trials of glucose-lowering interventions for people with type 2 diabetes impacts on the ability to compare findings and may mean that the results have little importance to healthcare professionals and the patients that they care for. The SCORE-IT study (Selecting Core Outcomes for Randomised Effectiveness trials In Type 2 diabetes) has addressed this issue by establishing consensus on the most important outcomes for non-surgical interventions for hyperglycemia in type 2 diabetes.

Research design and methods A comprehensive list of outcomes was developed from registered clinical trials, online patient resources, qualitative literature and long-term studies in the field. This list was then scored in a two-round online Delphi survey completed by healthcare professionals, people with type 2 diabetes, researchers in the field and healthcare policymakers. The results of this online Delphi were discussed and ratified at a face-to-face consensus meeting.

Results 173 people completed both rounds of the online survey (116 people with type 2 diabetes, 37 healthcare professionals, 14 researchers and 6 policymakers), 20 of these attended the consensus meeting (13 people with type 2 diabetes and 7 healthcare professionals). Consensus was reached on 18 core outcomes across five domains, which include outcomes related to diabetes care, quality of life and diabetes-related complications.

Conclusions Implementation of the core outcome set in future trials will ensure that outcomes of importance to all stakeholders are measured and reported, enhancing the relevance of trial findings and facilitating the comparison of results across trials.

BACKGROUND

Type 2 diabetes is a global pandemic. Current estimates indicate that 623 million people aged 20–79 will be affected by diabetes by 2045, with the majority of these cases being type 2 diabetes.1–3

Treatment for type 2 diabetes is targeted at the hyperglycemia arising due to a resistance to insulin action and an inadequate
surgical intervention. 

A recent review of active trials (recruiting or in follow-up period), phase III and IV trials registered with ClinicalTrials.gov identified considerable variation in the outcomes measured and reported for glucose-lowering therapies in people with type 2 diabetes. This variation may impact on the ability to compare studies and hinder evidence synthesis, contributing to waste in research. Furthermore, of the outcomes measured in the included trials, only 10% represented patient-reported outcomes. It is possible to address these issues and to increase the relevance of research by developing a core outcome set (COS), representing an agreed standardized set of outcomes that should be measured and reported in all trials for a specific clinical area. To date only two studies have investigated important outcomes for diabetes. Byrne et al. have developed a COS for young adults with type 1 diabetes, and Murad et al. explored outcomes important to patients with diabetes using a single item on a questionnaire that ranked a list of 10 outcomes.

The aim of the SCORE-IT study (Selecting Core Outcomes for Randomised Effectiveness trials In Type 2 diabetes) was to address this gap in outcomes research and develop a COS for use in clinical trials of non-surgical therapeutic interventions for the treatment of hyperglycemia in adults with type 2 diabetes that includes input from all stakeholders.

METHODS

Study overview

The development of the COS involved three stages (figure 1): (1) the generation of a long list of outcomes for use in an online Delphi; (2) a two-round online Delphi survey with key stakeholders; and (3) a face-to-face consensus meeting to discuss the results of the Delphi survey and agree on the COS. The methods for each step are described briefly below. A study protocol, systematic review and qualitative review describing methods in full have been published elsewhere.

Outcome list generation

The list of outcomes was generated from a number of sources, a systematic review of open trials registered with ClinicalTrials.gov, a rapid review of the qualitative literature and extraction of outcomes from patient experiences reported on HealthTalk Online (www.healthtalk.org). The detailed search strategies for ClinicalTrials.gov and for the qualitative review have been published elsewhere. In addition to these sources, outcomes were extracted from transcripts of video clips of adults aged 18 years and over with type 2 diabetes who shared their experience on the publicly available HealthTalk online website. The Study Steering Committee (SSC) also provided a list of long-term cardiovascular outcome studies in people with type 2 diabetes from which outcomes were extracted. Outcomes were extracted verbatim, for each source, before being grouped using a standardized outcome name and categorized according to the taxonomy of Dodd et al. The list was cross-checked against outcomes and domains included in the patient-reported outcome measures (PROMs) identified by Reaney et al. the BIRO (Best Information through Regional Outcomes) common data set for diabetes (www.eubirod.eu) and relevant Cochrane reviews. To identify relevant reviews the Cochrane database of systematic reviews was searched for “type 2 diabetes” in the “title,” “abstract” and “key words” fields. The resulting list of outcomes was reviewed by the SSC and outcomes further grouped or excluded if measured in a single study and/or considered to be of limited clinical importance to glucose-lowering interventions. Each outcome was written using plain language and feedback sought from the public contributor members of the SSC on the acceptability and their understanding of the wording used.

Online Delphi survey of stakeholders

The long list of outcomes was used to populate an online Delphi survey, delivered using the DelphiManager platform. Participants were invited from four key stakeholder groups: people with type 2 diabetes and their carers; healthcare professionals involved in delivering care for people with type 2 diabetes; researchers in the field; and healthcare policymakers/payers. Invitations to participate were shared with national and international patient and professional organizations, which were asked to distribute the invitations to their members (online supplementary file 1). We also approached the lead contact of the studies included in the ClinicalTrials.gov review, authors of relevant Cochrane reviews, researchers in receipt of funding from a large UK diabetes charity, and program leads at the National Institute of Diabetes and Digestive and Kidney Diseases of the National Institutes of Health and UK-based diabetes research centers. Finally, health professionals in the UK were contacted via the Wilmington’s UK database of health professionals. Policymakers were identified through the International Network of Agencies for Health Technology Assessment (INAHTA) members list and organizations approached individually.

The Delphi process was completed using two rounds (termed R1 and R2). In each round participants were presented with the list of outcomes and asked to score each outcome on how important it was to include in the COS, using a 9-point Likert scale presented in formats 1–9, with 1–3 labeled “not important,” 4–6 labeled “important but not critical,” and 7–9 labeled “critically important.” At the end of R1, participants were invited to submit additional outcomes, and these outcomes were reviewed by the SSC and any suggestions representing a new outcome added to the list to be scored in R2.
Figure 1: Core outcome set development overview. SSC, Study Steering Committee.
Outcomes were not removed from the list between R1 and R2. During R2, participants were shown the distribution of scores for each stakeholder group for each outcome together with their own score from R1 and asked to score the outcome again, using the same 1–9 Likert scale, taking this information into consideration.

**Consensus meeting**

A face-to-face consensus meeting was held in Liverpool, UK, and the results of the online Delphi survey were presented. Participants who had completed both R1 and R2 of the Delphi were invited to attend. Prior to the meeting, participants received a copy of their scores from the online survey and a consensus matrix detailing the results of R2 by stakeholder group (online supplementary file 2) and which outcomes had reached the predefined definition of consensus “in” or consensus “out” (table 1).

The meeting was chaired by an independent non-clinical researcher with expertise in COS development methodology. Outcomes that had reached consensus “in” after R2 in all four stakeholder groups were presented first, followed by outcomes that had reached consensus “out” after R2 in all four stakeholder groups. Meeting participants were asked if they disagreed with the inclusion or exclusion of these items from the COS, respectively. All outcomes with two or more stakeholder groups reaching consensus “in” were discussed, outcomes with one stakeholder group reaching consensus “in” were shown to meeting participants, and participants asked if any of these should be discussed. Outcomes with no consensus and no group scoring consensus “in” were not discussed.

Views for and against inclusion in the COS were sought by the meeting chair, who also ensured that participants had equal opportunity to comment prior to voting. Voting took place anonymously using the TurningPoint software and handsets (Turning Technologies, Youngstown, USA). Following voting the results were displayed to participants by stakeholder group. For the purpose of the consensus meeting, stakeholder groups were condensed to health-care professionals (this group included researchers in the field who also had a clinical role) and people with type 2 diabetes. Healthcare policymakers were present to provide their perspective and contribute to the discussions. The definition of consensus used in the Delphi survey (table 1) was applied with both groups required to reach the definition of consensus “in” for the outcome to be included in the COS. The final COS was presented at the end of the meeting and also included in a summary sent to participants after the meeting.

**Other analyses**

Attrition bias between R1 and R2 of the online Delphi was assessed by comparing the distribution of mean R1 scores for participants completing R1 only and participants completing both R1 and R2. Satisfaction with the consensus meeting process, organization and outcome was assessed using a questionnaire (online supplementary file 3).

**Study registration and study oversight**

The SCORE-IT study was prospectively registered with the COMET Initiative (Core Outcome Measures in Effectiveness Trials). The SSC composition has been described previously. The SCORE-IT study is reported in line with the Core Outcome Set – Standards for Reporting outcomes.39

**RESULTS**

An overview of the SCORE-IT COS development process and final COS is shown in figure 1. The final COS includes 18 outcomes across five domains (table 2).

**Development of the long list of outcomes**

The systematic review of clinical trials and the rapid review of qualitative studies have been presented in detail elsewhere. The review of clinical trials yielded 1444 individual outcomes and the qualitative review 474. These were combined with 409 outcomes from the long-term cardiovascular outcome studies and 232 outcomes identified from HealthTalk Online. The resulting 2560 outcomes were reviewed and outcome names standardized to give 223 outcomes. These 223 outcomes were reviewed against the remaining data sources. One additional outcome “hyperosmolar hyperglycaemic state” was identified from the review of outcomes used in Cochrane reviews and added to the long list. No further outcomes were identified from the BIRO data set or review of PROMs.

The 223 outcomes were mapped onto a 38-category system and grouped under five domains (mortality n=5, mortality n=5,
Table 2 Outcomes included in the SCORE-IT core outcome set

| Outcome                                                                 | Domain                        |
|------------------------------------------------------------------------|-------------------------------|
| Glycemic control: how well someone’s blood glucose is controlled.       | Physiological/clinical        |
| Global quality of life: someone’s overall quality of life, including   | Life impact                   |
| physical, mental and social well-being.                                |                               |
| Activities of daily living: being able to complete usual everyday tasks | Life impact                   |
| and activities, including those related to personal care, household     |                               |
| tasks or community-based tasks.                                        |                               |
| Body weight: how much someone weighs.                                  | Physiological/clinical        |
| Kidney function: how well someone’s kidneys are working.               | Physiological/clinical        |
| Hyperglycemia: how often someone has high blood glucose.               | Physiological/clinical        |
| Hypoglycemia: how often someone has low blood glucose levels.          | Physiological/clinical        |
| Visual deterioration or blindness: if someone’s eyesight gets worse     | Physiological/clinical        |
| or if they have loss of vision including blindness.                    |                               |
| Neuropathy: damage to the nerves caused by high glucose. This can lead  | Physiological/clinical        |
| to tingling and pain or numbness in the feet or legs. It can also      |                               |
| affect bowel control, stomach emptying and sexual function.            |                               |
| Having gangrene or having an amputation of the leg, foot or toe.       | Physiological/clinical        |
| Non-fatal myocardial infarction: having a heart attack that is not     | Physiological/clinical        |
| fatal.                                                                 |                               |
| Heart failure.                                                         | Physiological/clinical        |
| Cerebrovascular disease, including stroke, subarachnoid hemorrhage,    | Physiological/clinical        |
| transient ischemic attack and vascular dementia.                       |                               |
| How often someone is admitted to hospital because of their diabetes.   | Resource use                  |
| Hyperglycemic emergencies (to include diabetic ketoacidosis and        | Physiological/clinical        |
| hyperosmolar hyperglycemic state).                                    |                               |
| Side effects of treatment: any unwanted effects of the treatment.      | Adverse events                |
| Overall survival: how long someone lives.                              | Death                         |
| Death from a diabetes-related cause, such as heart disease.            | Death                         |

SCORE-IT, Selecting Core Outcomes for Randomised Effectiveness trials In Type 2 diabetes.

At the end of R2 of the Delphi, nine outcomes had reached consensus, for inclusion in the COS, across all four stakeholder groups, and nine outcomes had reached the definition for exclusion from the COS (online supplementary file 2).

Six outcomes reached the definition of “consensus in” in both R1 and R2 and have been included in the final COS.

The overall attrition rate between R1 and R2 was 25%, with the highest attrition rate observed for specialist/practice nurses (table 4).

The impact of attrition between rounds was assessed by comparing the average R1 scores of those who did not complete R2 against the distribution of scores for those completing both R1 and R2. Overall the distribution of average scores of those who did not complete R2 was similar to those completing both R1 and R2 for all stakeholder groups, suggesting that attrition bias was not present between rounds (online supplementary file 5).

Consensus meeting

Twenty participants attended the consensus meeting (7 healthcare professionals and 13 people with type 2 diabetes); in addition to the 20 voting participants, there

life impact n=67, physiological/clinical n=127, resource use n=22 and adverse events n=2). These outcomes were then presented to the SSC, and after discussion 64 outcomes (online supplementary file 4) were taken forward to the online Delphi.

Online Delphi process

One hundred and seventy three participants completed both R1 and R2 of the online survey. Participants comprised 37 healthcare professionals, 116 people with type 2 diabetes or their carers, 14 researchers in the field and 6 healthcare policymakers (table 3).

At the end of R1, 10 outcomes met the predefined criteria for inclusion in the COS across all four stakeholder groups. Fifty-one responses were received to the free-text question asking participants if there were any additional outcomes they would like to add. These outcomes were reviewed by the SSC and one outcome “gut microbiome - the type/number of bacteria in someone’s digestive tract” was added and scored by participants in R2. A further three outcomes (activities of daily living, satisfaction with treatment and care, and emotional well-being) were modified based on the free-text response to clarify the outcome.
Table 3  Characteristics of Delphi participants completing round 1 and round 2

| Characteristic                                      | n (%)
|-----------------------------------------------------|--------
| **Healthcare professionals**                        | 37 (100)
| Occupation                                          |

| 60–69                                               | 55 (47)
| 70–79                                               | 29 (25)
| >80                                                 | 2 (2)
| **Country of residence**                            |        
| Greece                                               | 1 (1)
| UK                                                   | 115 (99)
| Researchers in the field                            | 14 (100)
| **Country of residence**                            |        
| Malaysia                                             | 2 (14)
| Singapore                                            | 1 (7)
| South Africa                                        | 1 (7)
| UK                                                   | 9 (64)
| Not reported                                         | 1 (7)
| Healthcare policymakers/payers                      | 6 (100)

were 3 healthcare policymakers/payers who contributed to discussion along with members of the SSC. In the consensus meeting a further nine outcomes met the definition for inclusion in the COS, in addition to the nine outcomes that had reached the definition of consensus for inclusion at the end of R2 of the Delphi (online supplementary file 6). Of these outcomes, eight required further discussion by the SSC at a follow-up teleconference (online supplementary file 7). In addition to wording changes, one outcome “diabetic ketoacidosis” was amended to “hyperglycaemic emergencies (to include diabetic ketoacidosis and hyperosmolar hyperglycaemic state).” The SSC also reflected on the outcomes “hyperglycaemia,” how this had been interpreted by Delphi participants and that further discussion/think aloud work prior to launching the Delphi may have been needed. Finally, the SSC discussed the comment raised at the consensus meeting to add “prolongation of hospital stay” to the outcome “how often someone is admitted to hospital because of their diabetes.” All agreed that this was a separate outcome that had not been scored or added in the Delphi but is an important point for future discussion.

Feedback forms from the meeting were completed by 4 (57%) healthcare professionals and 12 (92%) people with type 2 diabetes. All participants were satisfied with the way the meeting was facilitated, felt able to contribute to the meeting and felt comfortable expressing their views. In terms of the consensus meeting producing a fair result, one health professional felt that voting may have been influenced by a dominant participant, and one person with type 2 diabetes neither agreed nor disagreed with the statement.

DISCUSSION

The SCORE-IT study has developed patient and health professional consensus on outcomes for trials of the treatment of hyperglycemia in people with type 2 diabetes. The process to achieve consensus has ensured that all stakeholders including people with type 2 diabetes, healthcare professionals, researchers in the field and healthcare policymakers/payers have been able to contribute to the final COS. We recommend that future trials of interventions to treat hyperglycemia in people with type 2 diabetes use the SCORE-IT COS. This COS does not prevent other outcomes being measured, as appropriate to the intervention, but rather represents the minimum that should be measured.

Particular strengths of the SCORE-IT COS include the use of methods meeting the COS-STAD (Core Outcome Set - STAndards for Development) recommendations, published in a study protocol prior to undertaking the study. This study has also engaged multiple stakeholder groups including health professionals and people with type 2 diabetes to achieve consensus on the most important outcomes. Only 3% of COS to date have included input from healthcare policymakers, the inclusion of policymakers in the present study has ensured that important outcomes used when evaluating the available evidence and making decisions are taken into consideration in the final COS. In the SCORE-IT
Table 4  Attrition rates between rounds

| Stakeholder                                      | Registered, n (% of total registrations) | Withdrawn prior to completing R1 | Withdrawn after R1 and before R2 | Completed R1, n (% of registrations minus withdrawals before R1) | Completed R2, n (% of R1) |

R1, round 1; R2, round 2.

study members of the International Network of Agen-
cies for Health Technology Assessment (INAHTA) were
approached with an invitation to take part. Of the 50
members, six (12%) completed R1 and R2 suggesting
that further work is needed to engage with HTA organ-
isations to facilitate the contribution of this stakeholder
group to COS development.

Although this study has had some international input,
engagement both in the UK and on an international
level was challenging, with only one patient and a fifth
of healthcare professionals and researchers combined
based outside of the UK. We sought to improve interna-
tional input from people with type 2 diabetes through
engagement with patient organizations and translation of
the Delphi into the appropriate local language. However,
despite Polish and Brazilian Portuguese versions being
distributed, via direct email to members of patient orga-
nizations, participation was low, with only one person
completing R1 of the Delphi in Polish. Choosing appro-
priate outcomes to measure is a top methodological
priority for trialists working in low-income and middle-
income countries (LMICs). A recent review found the
number of COS being developed in some LMICs has
increased, yet the number of participants in each COS,
the methods of engagement and the source of recruit-
ment have yet to be explored. Further work is warranted
in the field of COS research more generally on how best
to engage stakeholders and facilitate participation
nationally, internationally and particularly in countries
where representation in the COS development process
is low. For the SCORE-IT COS it will be important to
evaluate the acceptability of the current COS to patients
and professionals in other countries, particularly where
healthcare systems differ from that in the UK.

The SCORE-IT COS is specific for type 2 diabetes, yet
there is overlap with outcomes of importance to young
adults with type 1 diabetes identified by Byrne et al.17
Of the eight outcomes in their COS, all three outcomes
that are physiological/clinical are included in the current
SCORE-IT COS.17 Quality of life is also common across
the two COS, although in the study by Byrne et al17 this
was amended to “diabetes related quality of life” in response
to discussion at the consensus meeting. Other outcomes
included in the COS for young adults with type 1 diabetes
were included in the long list of outcomes scored in R1 of
the present study, yet these outcomes did not reach the
definition of consensus “in.” Self-management behavior,
specifically “Diabetes self-care activities...”, was discussed
further at the consensus meeting but did not reach
the definition of consensus for inclusion in the COS.

The SCORE-IT COS includes additional outcomes that
reflect complications of hyperglycemia, which were not
included in the COS developed by Byrne et al, suggesting
that while there are some similarities the priorities of
the stakeholders vary depending on the type of diabetes
and the age group of participants.

Murad et al18 included participants with both type
1 (5%) and type 2 (93%) in a survey to identify partic-
ipants’ top 5 outcomes from a list of 10. All 10 of the
outcomes ranked were included in the current Delphi
survey, and all, with the exception of the need for photo-
coagulation, scored in the present study as retinopathy,
were included in the current COS, with hemoglobin A1c
and end-stage renal disease included in the “glycaemic
control” and “kidney function” outcomes, respectively. The list of outcomes used by Murad et al. was generated from a panel of eight patients and ranked by patients only. Our approach to the development of the outcomes list and engagement of people with type 2 diabetes, healthcare professionals and researchers have identified an additional 10 outcomes, including outcomes within the life impact domain (quality of life and activities of daily living), which are important to all stakeholders.

The International Consortium for Health Outcomes Measurement (ICHOM) has recently reported a standard set for diabetes in adults. The development of this standard set has included international input from 26 experts (3 patients and 23 clinicians) and includes 26 outcomes. Fifty-four percent of the ICHOM standard set is reflected in the SCORE-IT COS, with some subtle differences. Most notably the life impact outcomes between the two outcome sets differ. Psychological wellbeing, diabetes distress and depression are included in the ICHOM, while these outcomes, scored collectively in SCORE-IT as “Emotional wellbeing,” did not reach the definition of “consensus in” in any round of the Delphi survey. Instead participants of the SCORE-IT study rated “global quality of life” and “activities of daily living” as the most important life impact outcomes. Two outcomes in the ICHOM standard set, “periodontal health” and “emergency room utilisation,” were not included in the SCORE-IT Delphi list of outcomes. Periodontal health was not measured/identified from any of the sources used to generate the long list of outcomes, while the need to attend the emergency room was identified in the systematic review but measured only in a single study and not taken forward to the Delphi survey. Neither outcome was added to the list by Delphi participants completing R1 of the Delphi survey.

While there is substantial overlap between the ICHOM standard set and the SCORE-IT COS, differences may reflect the scope of the projects, clinical practice versus clinical trials, respectively, and may also be influenced by the methods used and the type, number and geographic location of the stakeholders involved. Nevertheless the overlap between studies is positive, and if outcomes are captured routinely in clinical practice then this may help improve the efficiency of clinical trials and reduce the burden to trial participants.

CONCLUSIONS
The COS developed in the SCORE-IT study can be applied to future clinical trials of non-surgical interventions to treat hyperglycemia, and its use will allow comparisons to take place across trials, thereby reducing waste in research. The next steps will include seeking consensus on how these outcomes should be measured and to provide this guidance to researchers.

Acknowledgements
We would like to thank Richard Crew and Keith Kennedy for their support and guidance on the use of DelphiManager, Heather Bagley for her guidance and contribution to supporting people with type 2 diabetes attending the consensus meeting, Jamie Kirkham for preparing the graphs of the Delphi results and completing the risk of bias analysis, Nishanaran Srikanadaran, Karen Barnes and Alice Biggane for their help at the consensus meeting, and Sara Brookes for chairing the consensus meeting. We would also like to express our thanks to all participants to the study and to the organizations that helped to distribute the survey. The following are the Delphi survey participants wishing to be acknowledged: Ketan Dhatariya, Sheila, Nia Lewis, Helen Featherstone, Eiryl Morgan, Sophie Eastwood, Karen Corden, Oscar Rook, John Greives, Alleen E Grist, Peter Glynn, Judith Groves, Russell Dale, Alan Eadie, Melody Maglonzo, Lefevre, Mr S Lackey, Paul Jones, Fernando Rubinstein, Gareth Thompson, Ian Harris, Jael Nizza, Michael S Lawson, David Benson, Boun How Chew, John Cordwell, Lucy Packer, Chris Ellison, Angela Unsworth, Elizabeth Astlin, John Fuller, Garry Hoggett, Laura Gray, Louise Griff, J Brooman, Wendy Taylor, Ken Tait, Lisa Brookes, Mel Preston, Oloyede Oyekola, Keith Rathbone, Elaine Lum, Derrek Jerome, Cheow Peng Ooi, Joann Nicholson, Kevin Morley, Sophie Roberts, Jasmine Gentleman, Eva-Maria Kersmoto, Quan Zhang, Dr David Sheehan, John Turner, Sally Beckwith, Stephen Hales, Martin Hadley-Brown, Tracey Morrigan-Rheged, Ian Alloity, Victoria Rusztala, Eugenia Vlachou, Chris Smith, Chris Schops, Richard Deacon, Ingrid Zecheimster-Koss, AJ Chambers, John Lane, Jim Rider, Michael Luke, Sophie Werkü and Maria Österberg on behalf of SBU (Swedish Agency for Health Technology Assessment and Assessment of Social Services), Penny Parsons, Hank Beerstecher, Sue Falder, Gloria Lamprey, Banshi Saboo, Jeremy Ives, Ali Aldibbiat, Duncan Lynch, Jenny Lewington, Philip Higgins, Dr Mary-Christine A Michel, Florence Edohon, Dr Shadratha Karkare, Tanya Bailey, Dipesh Patel, Jayne Carter, Debbie Davies, and Simon Harding.

Collaborators
Collaborating authors, part of the SCORE-IT Study Team: Serena Battaglia, Florence Bietrix, Jacques Demotes-Mainard, Valerie Gallus-Durner, Silvio Garattini, Tim Moser, Cecilia A C Prinsen, Michael Raess, Adrian Sanz- Moreno, Caroline B Terwee.

Contributors
PRW and NLH conceived and designed the study, and as the study management group were responsible for the day-to-day running of the project. NLH drafted the manuscript; all authors reviewed and approved the final manuscript. All authors contributed to the review of the study design and to the review and analysis of study data. CT, GT, JH and RJP are volunteers of Diabetes UK who sit on the Study Steering Committee and who have provided an invaluable patient perspective for all aspects of the study. JPWH, JL and LP provided clinical input. As the corresponding author, NLH acts as guarantor for this study and has had full access to the data, final responsibility for the content of this article and the decision to submit for publication.

Funding
This work has received funding from the European Union’s Horizon 2020 research and innovation program (CORBEL, under grant agreement no 654248).

Competing interests
PRW is a member of the COMET Management Group. JPWH has received funding (grant income, personal fees and consultancy fees) from Astellas, AstraZeneca, Boehringer Ingelheim, Janssen Pharmaceuticals, Napp, Mundipharma, Novo Nordisk, Sanofi, Takeda and Wilmington Healthcare. All other authors declare they have no competing interests.

Patient consent for publication
Not required.

Ethics approval
Ethical approval was obtained from the University of Liverpool Research Ethics Committee prior to undertaking the consensus methods (online Delphi and consensus meeting) (ref: 3306).

Provenance and peer review
Not commissioned; externally peer reviewed.

Data availability statement
All data relevant to the study are included in the article or uploaded as supplementary information.
