MOTION OF CLOSED HYPERSURFACES IN THE CENTRAL FORCE FIELDS

WEIPING YAN

Abstract. This paper is devoted to study the motion of closed hypersurfaces in a radially symmetric potential. In physical, this kind of surface can be considered as an electrically charged membrane with a constant charge per area in a radially symmetric potential. The evolution of such surface has investigated by Schnürer and Smoczyk (Evolution of hypersurfaces in central force fields, J. Reine Angew. Math. 550 (2002), 77-95). To study its motion, we introduce a quasi-linear degenerate hyperbolic equation which describes the motion of the surfaces extrinsically. Our main results show that the long time existence of such Cauchy problem and the stability with respect to initial data. When the radially symmetric potential function \( v \equiv 1 \), the local existence and stability result has been obtained by Notz (Closed Hypersurfaces driven by mean curvature and inner pressure, Comm. Pure Appl. Math. 66(5) (2013), 790-819)

1. Introduction and Main Results

This paper considers the motion of closed hypersurfaces in a radially symmetric potential, which can also be seen as the motion of closed hypersurfaces in Riemannian manifolds with density. In physical, this kind surface can be considered as an electrically charged membrane with a constant charge per area in a radially symmetric potential. Let \( \Sigma \) be an oriented smooth closed manifold of dimension \( n \), and \( (\mathcal{M}, \tilde{g}) \) be an oriented smooth complete \( n+1 \)-dimensional Riemannian manifold. Consider a smooth family of immersion \( F : [0, T] \times \Sigma \rightarrow \mathcal{M} \), we define an action integral of the form

\[
S(F) = \int_0^T \mathcal{K}(F) - \mathcal{V}(F)dt,
\]

where \( \mathcal{K} \) is the kinetic energy and \( \mathcal{V} = V + J \) is the total inner energy, \( V \) is a radially symmetric potential energy and \( J \) is the inner pressure.

We fix a reference measure \( d\mu \) on \( \Sigma \) with a smooth density function defining a mass distribution on \( \Sigma \). Then the total kinetic energy of all the points of the surface is

\[
\mathcal{K}(F) = \frac{1}{2} \int_{\Sigma} |\partial_t F|^2 d\mu.
\]

We denote \( d\mu_t \) as the induced surface measure of the induced metric \( g = F(t)^*\tilde{g} \) at time \( t \), \( \varphi \) denotes a smooth, radially symmetric function (reflecting the presence

Date: September 2013.
This work supported by NSFC No 11201172 and SRFDP Grant No 20120061120002.
of a central force) depending on \( s := \frac{|F|^2}{2} \). The radially symmetric potential energy of the hypersurface \( F(\Sigma) \) is defined as

\[
V(F) = \int_{\Sigma} v(s(F))d\mu,
\]

where \( v \) is defined by

\[
v(s) = \exp\left(-\frac{n}{2} \int_1^s \frac{\eta(w)}{w} dw\right),
\]

\[
\varphi(s) = -\frac{\partial_w v(w)}{v(w)} = \frac{n}{2w} \eta(w),
\]

where \( \eta : \mathbb{R}^+ \to \mathbb{R} \) is a smooth function.

The inner pressure is defined as

\[
\mathcal{J}(F) = -\rho \log\left(\frac{Vol(F)}{Vol_0}\right),
\]

where \( \rho > 0 \) denotes a parameter which determines strength of the influence of the inner pressure compared to the surface tension, \( Vol(F) \) denotes the enclosed volume of the surface \( F(\Sigma) \). The initial enclosed volume \( Vol_0 \) as well as the constant \( \rho \) are included for scaling reasons. This inner pressure is motivated by that of an ideal gas with constant temperature, i.e. proportional to \( Vol^{-1}(F) \). One can see [14, 15] for more details on the inner pressure.

Then the action integral is

\[
S(F) = \frac{1}{2} \int_0^T \int_{\Sigma} |\partial_t F|^2 d\mu dt - \int_0^T \int_{\Sigma} v(s(F))d\mu dt + \rho \int_0^T \log\left(\frac{Vol(F)}{Vol_0}\right) dt.
\]

The Euler-Lagrange equations for functional \( S(F) \) is

\[
\nabla_{\partial_t} \partial_t F = \frac{d\mu}{d\mu} v(F) \left( -H(F) + \varphi F - \varphi \nabla\frac{|F|^2}{2} + \frac{\rho}{Vol(F)} \right) \nu,
\]

where \( H(F) \) denotes the mean curvature of \( F(\Sigma) \), \( \nu \) denotes the outer unit normal, \( \nabla_{\partial_t} \) denotes the covariant derivative along \( F \), i.e.

\[
\nabla_{\partial_t} \partial_t F = \partial_{tt} F + \tilde{\Gamma}^\alpha_{\beta\gamma}(F) \partial_t F^\beta \partial_t F^\gamma,
\]

with \( \tilde{\Gamma}^\alpha_{\beta\gamma} \) being the Christoffel symbols of \( \tilde{g} \). Here and in the sequel, we use the Einstein summation convention.

Another setting of above problem is that closed hypersurfaces moves in Riemannian manifolds with density \( v(s) \). To our knowledge, Gromov [8] first studied the manifolds with densities as “mm-spaces”, and mentioned the natural generalization of mean curvature in such spaces. Morgan and his collaborators [11, 16] considered the corresponding mean curvature \( H_\omega = H - <\nabla \omega, \nu> \), where the density \( \omega \) is denoted by \( e^{\omega} \). When the density in \( \mathcal{M} \) is the Gaussian density \( (\gamma^n)^{\frac{1}{2}} e^{-\frac{|F|^2}{2}} \), Borisenko and Miquel [2] studied a flow of a hypersurface driven by its mean curvature associated to the Gaussian density. It is obviously that the Gaussian density is a special case of the density \( v(F) = \exp(-\frac{n}{2} \int_1^s \frac{\eta(w)}{w} dw) \).

The study of mean curvature flow can date back to Brakke [1], who introduced the notion of a submanifold moving by its mean curvature in arbitrary codimension and constructed a generalized varifold solution for all time. Huisken [6, 7] showed that the mean curvature flow has much abundant and complicated behaviour, e.g.
singularity and asymptotic behaviours. Schnürer and Smoczyk [17] studied the asymptotic behaviour of mean curvature flow in central force fields, where they chose the radially symmetric potential as \( (1.1) \). For complex geometry, Chen and Tian [3] used the mean curvature flow in a Kähler-Einstein surface to show the symplectic property being preserved as long as the smooth solution exists. Chen and Li [3] produced holomorphic curves from a given initial symplectic surface by the mean curvature flow method. Recently, LeFloch and Smoczyk [10] established a hyperbolic mean curvature flow, which is a strictly hyperbolic equation when the tangential part vanishing. Then they obtained the local existence and singularity for such flow. A new kind of more physical hyperbolic mean curvature flow was established by Notz [15], its motivation is closed hypersurfaces moving driven by mean curvature and inner pressure. Meanwhile, the local existence of smooth solutions and the stability with respect to initial data was obtained.

We notice that the \( d\mu \)-term of equation \( (1.2) \) prevents reparametrization of \( (1.2) \) (see [5] for the method of reparametrization) to remove the degeneracy of such a quasilinear equation. Hence a suitable approximation method should be explored. One of main results in this paper is the long time existence of equation \( (1.2) \).

**Theorem 1.1.** Let \( F_0 : \Sigma \rightarrow \mathcal{M} \) be any smooth immersion with \( \text{Vol}(F_0) = \text{Vol}_0 > 0 \), and initial velocity \( F_1 \in \Gamma(F_0^* T\mathcal{M}) \). Assume that the radially symmetric potential function \( v \) has the form \( (1.1) \), and \( 0 < \frac{\eta'(w)}{w} \leq |w|^p, \ 0 \leq p < \infty \).

Then there exists a smooth family of immersions \( F : [0, \frac{T}{\sqrt{\varepsilon}}] \rightarrow \mathcal{M} \) solving the Cauchy problem \( (1.2) \) with small initial data \( F(0, \cdot) = \varepsilon F_0 \) and \( \partial_t F(0, \cdot) = \varepsilon F_1 \). Here \( \Gamma(F_0^* T\mathcal{M}) \) denotes the space of smooth sections in a vector bundle \( F_0^* T\mathcal{M} \), and \( \varepsilon \) is a positive small parameter.

We remark that we construct a small amplitude smooth solution, which can exist on time interval \( [0, \frac{T}{\sqrt{\varepsilon}}] \) for a positive constant \( T \). Here \( \varepsilon \) is a small parameter measures the nonlinear effects.

Next result gives the stability and uniqueness of solutions for equation \( (1.2) \) with respect to the initial data.

**Theorem 1.2.** Let \( \bar{s} > \max\{2, \frac{n}{2}\} \). Assume that equation \( (1.2) \) with two different small initial data \( (\bar{F}_0, \bar{F}_1) \) and \( (\tilde{F}_0, \tilde{F}_1) \) has two different solutions \( \bar{F} \) and \( \tilde{F} \) in \( B_{R,T}^\beta : = \{ F \in C^\infty_T : \|F\|_{s,T} \leq R < 1 \} \). If two initial data

\[
\|\bar{F}_0 - \tilde{F}_0\|_{s,T} + \|\bar{F}_1 - \tilde{F}_1\|_{s,T} \leq O(\varepsilon),
\]

then we have

\[
\|\bar{F} - \tilde{F}\|_{s,T} \leq O(\varepsilon).
\]

In particularly, when \( \bar{F}_0 = \tilde{F}_0 \) and \( \bar{F}_1 = \tilde{F}_1 \), the solution of equation \( (1.2) \) on the time interval \( [0, \frac{T}{\sqrt{\varepsilon}}] \) is uniqueness, i.e. \( \bar{F} = \tilde{F} \).

The organization of this paper is as follows. In Section 2, we derive some conservation laws on the solution of equation \( (1.2) \). In section 3, we establish the existence of weakly linear hyperbolic system which will arise in the linearization of equation \( (1.2) \). Section 3 is devoted to solving equation \( (1.2) \) by means of a new Nash-Moser iteration scheme (For general Nash-Moser implicit function theorem, one can see
In the last section, we give the proof of the stability problem with respect to the initial data and the uniqueness of solution for equation (1.2).

2. Conservation Laws

In this section, we derive three conservation laws, which are satisfied by the solution of (1.2). More precisely, they are the total energy conservation, the momentum conservation and the interior momentum conservation. Let \( X \) be a killing vector field on \( \mathcal{M} \). We define the total energy by

\[
E(F(t, \cdot)) = \frac{1}{2} \int_{\Sigma} |\partial_t F|^2 d\mu - \int_{\Sigma} v(s(F)) d\mu + \rho \log \left( \frac{Vol(F)}{Vol_0} \right),
\]

the momentum with respect to \( X \) of a solution \( F \) of (1.2) by

\[
M_X(F(t, \cdot)) = \int_{\Sigma} <\partial_t F, X(F)> d\mu,
\]

the interior momentum with respect to a vector field \( Y \) (\( \text{div}_d\mu Y = 0 \)) by

\[
Q_Y(F(t, \cdot)) = \int_{\Sigma} <\partial_t F, F*Y> d\mu.
\]

For the total energy conservation, we have:

Lemma 2.1. Let \( F : [0, T) \times \Sigma \rightarrow \mathcal{M} \) be a solution of (1.2). Then we have

(1). \( E(F(t, \cdot)) = E(F(0, \cdot)) \) for all \( t \in [0, T) \).

(2). Let \( \partial_t F \) be the tangential part of \( \partial_t F \). Then we have

\[
\partial_t \left( \frac{1}{2} |\partial_t F|^2 + v \frac{d\mu_t}{d\mu} \right) = \partial_t F, \nabla v > \frac{d\mu_t}{d\mu} + \rho \frac{Vol(F)}{Vol_0} \partial_t F, \nu > \frac{d\mu_t}{d\mu} + v(\text{div}\partial_t F^T) \frac{d\mu_t}{d\mu}. \]

Proof. The proof of (1) is simple, so we omit it. Now we derive the equality in (2).

Using (1.2), we derive

\[
\partial_t \left( \frac{1}{2} |\partial_t F|^2 + v \frac{d\mu_t}{d\mu} \right) = \partial_t F, \nabla v > \frac{d\mu_t}{d\mu} + v(\text{div}\partial_t F^T) \frac{d\mu_t}{d\mu} + v \partial_t F, H\nu > \frac{d\mu_t}{d\mu} + \partial_t v \frac{d\mu_t}{d\mu}
\]

\[= -v <\partial_t F, H\nu > \frac{d\mu_t}{d\mu} + v <\partial_t F, \varphi F > \frac{d\mu_t}{d\mu} + <\partial_t F, \nabla v > \frac{d\mu_t}{d\mu} + \rho \frac{Vol(F)}{Vol_0} <\partial_t F, \nu > \frac{d\mu_t}{d\mu} + v(\text{div}\partial_t F^T) \frac{d\mu_t}{d\mu} + v \partial_t F, H\nu > \frac{d\mu_t}{d\mu} + \partial_t v \frac{d\mu_t}{d\mu},\]

where we use the form of \( v \) in the last inequality. \( \square \)

Lemma 2.2. Assume that there is a positive constant \( c \) such that

\[
\int_{\Sigma} v d\mu_t \geq c Vol(F^T)\nabla v.
\]

Then there exists a positive constant \( K \) depending on \( Vol_0, c, \rho \) and \( E_0 \) such that

\[
Vol_0 e^{-\frac{2\rho}{\tau}} \leq Vol(F) \leq K,
\]

\[
\int_{\Sigma} \frac{1}{2} |\partial_t F|^2 d\mu + \int_{\Sigma} v d\mu_t \leq E_0 + \rho \log \left( \frac{K}{Vol_0} \right).
\]

Proof. This proof is simple, and can also be found in [13], so we omit it. \( \square \)
For the momentum conservation, we have:

**Lemma 2.3.** Let \( F : [0, T) \times \Sigma \rightarrow M \) be a solution of \((1.2)\). Then we have

1. \( M_X(F(t, \cdot)) = M_X(F(0, \cdot)) \) for all \( t \in [0, T) \).
2. Let \( \partial_t F^T \) be the tangential part of \( \partial_t F \). Then we have

\[
\partial_t < \partial_t F, X > = vdiv X T \frac{d\mu_t}{d\mu} + \langle H - \nu, X \rangle + \frac{\rho}{Vol(u)} < \nu, X > \frac{d\mu_t}{d\mu}.
\]

**Proof.** The momentum conservation \((1)\) can be obtained by integrating \((2)\) with respect to \( d\mu \) and using that \( \int_\Sigma < \nu, X > \frac{d\mu}{Vol(u)} = 0 \). So we only prove \((2)\).

We denote \( \phi_q \) as the local flow of \( X \), which is by definition an isometry, and set \( F_q = \phi_q \circ F \). Then we have

\[
\partial_t < \partial_t F, X > = \langle H, X \rangle - \nu < H, X > \frac{d\mu_t}{d\mu} + \langle v \phi F, X \rangle + \langle v, \phi F, X \rangle + \frac{\rho}{Vol(u)} < \nu, X > \frac{d\mu_t}{d\mu}.
\]

where since \( X \) is killing, we have \( \frac{\partial}{\partial q} \mid_{q=0} \log(d\mu_t(F_q)) = 0 \) and \( \frac{\partial}{\partial q} \mid_{q=0} \nu(s(F_q)) = 0 \).

**Lemma 2.4.** Let \( F : [0, T) \times \Sigma \rightarrow M \) be a solution of \((1.2)\) and \( \partial_t F^T \) be the tangential part of \( \partial_t F \). Then we have

1. \( Q_Y(F(t, \cdot)) = Q_Y(F(0, \cdot)) \) for all \( t \in [0, T) \).
2. \( \partial_t < \partial_t F, F^T Y > = \frac{1}{2} \text{div} \mu \left( (\partial F)^2 Y \right) \).

**Proof.** This proof is the similar with Proposition 2.4 in [15], so we omit it. \( \square \)

### 3. Analysis of linearized weakly hyperbolic systems

This section is to discuss the linearized system of \((1.2)\), which is a weakly hyperbolic linear systems. More precisely, it is obtained by decomposing with respect to time dependent subbundles into a system of coupled linear wave equations and linear ODEs. Here we prove the local existence of smooth solution of an abstract system for convenience. Firstly, we give some definitions of the norm and some inequalities. Let \( \Psi : \Omega \rightarrow \Sigma \) be a \( k \)-dimensional Riemannian vector bundle over \( \Sigma \), and \( F \) be the Fréchet space of smooth time dependent sections of \( \Omega \). Assume that we have an atlas of coordinate charts \((x_\alpha, U_\alpha)\) of \( \Omega \) such that \( \alpha = 1, \cdots, J \), \( x_\alpha(U_\alpha) = B_1(0) \), and the sets \( x_\alpha^{-1}(B_1(0)) \) cover \( \Sigma \), where \( B_1(0) \subset \mathbb{R}^n \) is a ball with radius 1. Meanwhile, for each such chart there are smooth space dependent local sections \( \nu_A^\alpha, A = 1, \cdots, d', \) and \( \tau_d^\alpha, d = 1, \cdots, d'' \), of \( \Omega \) \( (d' + d'' = k) \) defined on the domain of the chart that together form a basis of the fiber over each point in \( U_\alpha \). For any other chart \((x_\beta, U_\beta)\) with \( U_\alpha \cap U_\beta \neq \emptyset \), we assume that the \( \nu_A^\alpha(p) \) and \( \nu_A^\beta(p), p \in U_\alpha \cap U_\beta \), span the same space and are bases for this space.
spanned by the \( \nu_{\alpha} \) and the \( r_{\tau} \) are orthogonal. For the specific (fixed) coordinate chart, we omit the index \( (\alpha) \) for convenience. Let \( h \in F \). In each coordinate chart we take the decompose

\[
h = h_\perp + h_T = u^A \nu_A + r^d \tau_d.
\]

For any \( s \in [1, \infty] \), \( H^s(B_1(0), \mathbb{R}^d)^{\times J} \) be the Sobolev space of the set of functions \( (u_{(\alpha)}^A) \). The corresponding norm is

\[
\|u\|_s = \sum_{\alpha=1}^J \sum_{A=1}^{d'} \|u_{(\alpha)}^A\|_{H^s(B_1(0))}.
\]

For \( \nu \), we use the norm

\[
\|\nu\|_s = \sum_{\alpha=1}^J \sum_{A=1}^{d'} \|\nu_{\alpha}^A \circ x^{-1}\|_{H^s(B_1(0))}.
\]

\( C^J([0, T]; H^s(B_1(0), \mathbb{R}^d)^{\times J}) \) denotes the function spaces with the norm

\[
\|u\|_{C^J([0, T]; H^s(B_1(0), \mathbb{R}^d)^{\times J})} = \sup_{[0, T]} \sum_{\alpha=1}^J \sum_{A=1}^{d'} \|\partial_t^\alpha u_{(\alpha)}^A\|_{H^s(B_1(0))}.
\]

\( C^J_T := \cap_{J=0}^J C^J([0, T]; H^{s-J}(B_1(0), \mathbb{R}^d)^{\times J}) \) denotes function space with the space-time norm

\[
\|u\|_{s, T} = \sup_{[0, T]} \sum_{\alpha=1}^J \sum_{A=1}^{d'} \|\partial_t^\alpha u_{(\alpha)}^A\|_{H^{s-J}(B_1(0))}.
\]

We similarly define \( \|\cdot\|_{C^J} \) as the spatial \( C^J \)-norm and the \( \mathbb{L}^2 \)-Sobolev norm of order \( s \) in space and time. It is obviously that \( \|u\|_{H^s(B_1(0))} \leq \|u\|_{C^J([0, T]; H^s(B_1(0)))} \leq \|u\|_{s, T} \).

We make use of the following inequalities, which can be proven using classical methods of calculus; see, for example, the book of Chapter 13 in [21]. Note that while versions of these estimates hold in all dimensions, as presented here the estimates are dependent on the dimension of \( \Sigma \) being \( n \). Generic constants are denoted by \( c_0, c_1, \ldots \), their values may vary in the same formula or in the same line.

### Sobolev inequality

For \( s > \frac{n}{2} \) and \( u \in H^s(B_1(0)) \) we have

\[
\|u\|_{L^\infty(B_1(0))} \leq \|u\|_{H^s(B_1(0))}.
\]

### Product inequality

For \( u, v \in L^\infty(B_1(0)) \cap H^s(B_1(0)) \) we have

\[
\|uv\|_{H^s(B_1(0))} \leq \|u\|_{H^s(B_1(0))} \|v\|_{L^\infty(B_1(0))} + \|u\|_{L^\infty(B_1(0))} \|v\|_{H^s(B_1(0))}.
\]

In particular, if \( s > \frac{n}{2} \), we have

\[
\|uv\|_{H^s(B_1(0))} \leq \|u\|_{H^s(B_1(0))} \|v\|_{H^s(B_1(0))}.
\]

We denote the spatially weighted Lebesgue spaces by \( L^2_s(\mathbb{R}^n) \), which is equipped with the norm

\[
\|u\|_{L^2_s} = \int_{\mathbb{R}^n} \left(1 + |x|^2\right)^{s/2} |u|^2.
\]

Then the Fourier transform is an isomorphism between \( L^2_s(\mathbb{R}^n) \) and \( H^s(\mathbb{R}^n) \).
For \( T > 0, s > \max\{\frac{3}{2}, 2\} \) and \( 0 < R < 1 \), we define
\[
B_{R,T} := \{ u \in C^s_T = \bigcap_{s=0}^{\infty} C^s([0, T]; H^{s-1}(B_1(0), \mathbb{R}^d)) : \| u \|_{s,T} \leq R < 1 \}.
\]

We say that \( h = u^A \nu_A + r^d \tau_d \) is a solution of a weakly hyperbolic linear system if in each local coordinate chart \((x_\alpha, U_\alpha)\) we have
\[
\begin{align*}
\partial_t u^A - v(F) L^A u^A - v(F) N^A r - v(F) Q^A u^A &= h^A, \\
\partial_t r^d - v(F) M^d r - v(F) P^d u &= h^d,
\end{align*}
\]
with the initial data
\[
\begin{align*}
u^A(0) &= u_0^A, \quad \partial_t u^A(0) = u_1^A, \\
r^d(0) &= r_0^A, \quad \partial_t r^d(0) = r_1^A,
\end{align*}
\]
where \( v(F) = \exp(-\frac{2}{\xi^2} \int_1^{\|w\|_\infty} \frac{\nu(w)}{\xi} \, dw \) and
\[
\begin{align*}
L^A u^A &= a^{Aij}(t, x) \partial_i \partial_j u^A + a^{Aij}(t, x, \nu, \tau_d) \partial_i u^A + a^A(t, x, \nu, \tau_d) u^A, \\
N^A r &= n^{A}(t, x, \nu, \tau_d) \partial_i r^j + n^A(t, x, \nu, \tau_d) r^i + n^A(t, x, \nu, \tau_d) \partial_i r^d
\end{align*}
\]
\[
\begin{align*}
Q^A u &= q^{Ai}(t, x, \nu, \tau_d) \partial_i u^B + q^A(t, x, \nu, \tau_d) u^B + q^{AB}(t, x, \nu, \tau_d) \partial_i u^B, \\
M^d r &= n^d(t, x, \nu, \tau_d) r^i + n^{d}(t, x, \nu, \tau_d) \partial_i r^i, \\
P^d u &= P^d(t, x, \nu, \tau_d) \partial_i u^B + P^d(t, x, \nu, \tau_d) \partial_i u^B.
\end{align*}
\]
We assume all the coefficients in (3.1) and (3.2) and \( u^A \) and \( r^d \) to be smooth functions on \( x_\alpha(U_\alpha) \), and \( \sup b_{(\beta)}^{Aij} \sup c_{(\beta)B}^A \leq x_\beta^{-1}(B_1(0)) \), \( a^{Aij}(t, x) = a^{Aji}(t, x) \) and \( a^{Aij}(t, x) \) satisfies
\[
\rho_0 \delta^{ij} |\xi|^2 \leq a^{Aij} \xi_i \xi_j \leq \rho_1 \delta^{ij} |\xi|^2, \quad \forall \xi \in \mathbb{R}^n,
\]
for some positive constants \( \rho_0 \leq \rho_1 \). On the other hand, we need that the operators are coordinate invariant under coordinate transformation on \( \Sigma \) and under a change of basis between different \((\nu^{(\alpha)}_A, \tau^{(\alpha)}_d)\) and \((\nu^{(\beta)}_A, \tau^{(\beta)}_d)\). This means that the external force \( W = h^A \nu_A + h^d \tau_d \) is an element of \( \Omega \).

For the coefficient of the operators \( L^A, N^A, Q^A, M^d \) and \( P^d \), we define the local norm
\[
\begin{align*}
[L]_s &= \sum_{a=1}^{J} \sum_{\alpha=1}^{A} \sum_{\alpha,j=1}^{A} \| a^{Aij} \|_{H^s(B_1(0))} + \sum_{A,i=1}^{A} \| a^A \|_{H^s(B_1(0))} + \sum_{A} \| a^A \|_{H^s(B_1(0))}, \\
[N]_s &= \sum_{a=1}^{J} \sum_{\alpha=1}^{A} \sum_{\alpha,i=1}^{A} \| n^{ai} \|_{H^s(B_1(0))} + \sum_{A,i=1}^{A} \| n^A_i \|_{H^s(B_1(0))} + \sum_{A,d} \| n_d^{A0} \|_{H^s(B_1(0))} \\
&+ \sum_{A} \| n^A_i \|_{H^s(B_1(0))} + \sum_{A,j} \| b^{Aij} \|_{H^s(B_1(0))},
\end{align*}
\]
\[ [Q]_s = \sum_{\alpha=1}^{J} [Q]_{s,\alpha} = \sum_{\alpha=1}^{J} \left( \sum_{A,B,i} \|q_{AI}^i\|_{H^s(B_1(0))} + \sum_{A,B} \|q_{BI}^A\|_{H^s(B_1(0))} + \sum_{A,B} \|q_{A0}^0\|_{H^s(B_1(0))} \right), \]

\[ + \sum_{A} \|q_{AI}^A\|_{H^s(B_1(0))} + \sum_{A,j} \|c_{J_i}^A\|_{H^s(B_1(0))}, \]

\[ [M]_s = \sum_{\alpha=1}^{J} [M]_{s,\alpha} = \sum_{\alpha=1}^{J} \left( \sum_{d,i} \|m_{d_i}^i\|_{H^s(B_1(0))} + \sum_{d,i} \|m_{d0}^d\|_{H^s(B_1(0))} \right), \]

\[ [P]_s = \sum_{\alpha=1}^{J} [P]_{s,\alpha} = \sum_{\alpha=1}^{J} \left( \sum_{B,d,j} \|P_{d_j}^B\|_{H^s(B_1(0))} + \sum_{B,d} \|P_{B0}^d\|_{H^s(B_1(0))} \right). \]

Then assume that

\[(3.11) \quad [L]_s + [\partial_t L]_s + [N]_s + [Q]_s + [M]_s + [P]_s \leq c_0, \]

\[ 0 = \det(<\nu_A,\nu_B>) > c_1, \quad \det(<\nu_A,\partial_t \nu_B>) > c_1. \]

We give some estimates on \( \nu = \frac{\partial_t F_{L_1} \cdots \partial_t F_{L_p}}{\partial_t F_{L_1} \cdots \partial_t F_{L_p}} \) and \( \tau_d = \partial_d F \). The proof of the following results is similar with the results in page 26, 49 of [14], so we omit it.

**Lemma 3.1.** Let \( F \in \mathcal{B}^*_{R,T} \). Assume that \( \|\nu\|_{\mathcal{C}^0} + \|\tau\|_{\mathcal{C}^0} \leq R \) for some \( R > 0 \) and \( (3.10)-(3.12) \) holds. Then there exists a constant \( c_1 \) such that

\[ \|\nu^{AB}\|_{H^s(B_1(0))} \leq c_1 (1 + \|\nu\|_{H^s(B_1(0))}), \]

\[ \|\tau^{d}\|_{H^s(B_1(0))} \leq c_1 (1 + \|\tau\|_{H^s(B_1(0))}), \]

\[ \|\nu^{AB}\|_{H^s([0,T] \times B_1(0))} \leq c_1 (1 + \|\nu\|_{H^s([0,T] \times B_1(0))}), \]

\[ \|\tau^{d}\|_{H^s([0,T] \times B_1(0))} \leq c_1 (1 + \|\tau\|_{H^s([0,T] \times B_1(0))}), \]

\[ \|\nu\|_s \leq c_1 (1 + \|F\|^{s+1}), \quad \|\nu\|_s \leq c_1 (1 + \|\tau\|^{s+1}), \]

\[ \|\delta^i_t \nu\|_s \leq c_1 (1 + \sum_{i=0}^{l} \|\delta^i_t F\|^{s+1}), \quad \text{for } i > 1, \]

\[ \|\nu^{AB}\|_{\mathcal{C}^0(B_1(0))} \leq c_1, \quad \|\tau^{d}\|_{\mathcal{C}^0(B_1(0))} \leq c_1. \]

From above result, we can see

\[ \|\nu\|^{s+1} + \|\delta^i_t \nu\|^{s+1} + \|\delta^2_t \nu\|^2 + \|\tau\|^{s+1} + \|\delta_t \tau\|^{s+1} \leq c_2. \]

The following result is the main result in this section, which states the existence of linear system \((3.10)-(3.12)\).

**Proposition 3.2.** Assume that \( (3.10)-(3.12) \) holds. Let \( h_0, h_1 \in \mathcal{C}^\infty(\Sigma, \Omega) \) and \( F \in \mathcal{B}^*_{R,T} \) be given. Then system \((3.1)-(3.2)\) has a unique smooth solution \( h \) on \([0,T] \times \Sigma \) with \( h(0) = h_0 \) and \( \partial_t h(0) = h_1 \) for some given external force \( W = h^A \nu_1 + h^d \tau_d \in \mathcal{C}^\infty([0,T] \times \Sigma, \Omega) \).

Before giving the proof of above result, we carry out some priori estimates on the solution \((u^A, r^d)\) of system \((3.1)-(3.2)\) in local coordinates. We remark that the following energy estimates does not depend on the compact property of the spatial domain. We also do not use the integral on spatial variable by part. The main idea of proof of Lemma 3.2-3.3 divides into two steps. The first step is to find a suitable differential inequality with respect to the time variables. The last step is to integrate the time variable by part. Meanwhile, the integral on spatial variable is taken.
Lemma 3.3. Let \((u^A, r^d)\) be a smooth solution to system \(\text{(3.1)}-\text{(3.2)}\) with initial data \(\text{(3.3)}-\text{(3.4)}\). \(F \in B^n_0\) is given. Assume that \(\text{(3.10)}-\text{(3.12)}\) holds. Then there holds

\[
\int_0^T \int_{B_1(0)} [\lambda - c_3 v(F) - c_4 u \frac{|F|^2}{|F|^2}] < \partial_t F + \partial_t F, F > v(F) |e^{-\lambda t}]
\times [\langle u^A_t \rangle^2 + a^{Aij} \partial_t u^A \partial_j u^A + (u^A_t)^2 + (r^d_t)^2] dx dt
\leq \int_{B_1(0)} e^{-\lambda t} ((u^A_t)^2 + a^{Aij} \partial_t u^A \partial_j u^A + (u^A_t)^2 + (r^d_t)^2) dx
\]

\[
+ c_5 \int_0^T \int_{B_1(0)} e^{-\lambda t} [(h^A_t)^2 + (h^d_t)^2 + (\partial_t r^d_t)^2] dx dt.
\]

(3.13)

**Proof.** Taking the inner product of the linear system \(\text{(3.1)}\) with \(2e^{-\lambda t} u^A_t\) and using \(\text{(3.5)}\), we have

\[
\partial_t [e^{-\lambda t}((u^A_t)^2 + v(F) a^{Aij} \partial_i u^A \partial_j u^A)] = \lambda e^{-\lambda t}((u^A_t)^2 + v(F) a^{Aij} \partial_i u^A \partial_j u^A)
\]

\[
-2e^{-\lambda t} \partial_t (v(F) a^{Aij} u^A_t \partial_j u^A)
\]

\[
= v(F) e^{-\lambda t} (\partial_t a^{Aij} \partial_i u^A \partial_j u^A - 2v(F) e^{-\lambda t} (\partial_t a^{Aij} u^A_t \partial_i u^A)
\]

\[
-2(\partial_t v(F) + \partial_t v(F)) e^{-\lambda t} a^{Aij} \partial_i u^A \partial_j u^A
\]

\[
+ 2v(F) e^{-\lambda t} a^{Aij} u^A_t \partial_i u^A + 2v(F) e^{-\lambda t} a^{Aij} u^A_t u^A
\]

\[
+ 2v(F) e^{-\lambda t} u^A_t N^A r + 2e^{-\lambda t} v(F) u^A_t Q^A u^A + 2e^{-\lambda t} u^A_t h^A.
\]

(3.14)

Taking the inner product of the linear system \(\text{(3.2)}\) with \(2e^{-\lambda t} r^d_t\), we have

\[
\partial_t [e^{-\lambda t}(r^d_t)^2] + \lambda e^{-\lambda t}((r^d_t)^2) = 2e^{-\lambda t} v(F) r^d_t M^d_t
\]

\[
+ 2e^{-\lambda t} v(F) r^d_t P^d u + 2e^{-\lambda t} r^d_t h^d.
\]

(3.15)

Since we have

\[
\partial_t [e^{-\lambda t}(u^A_t)^2] + \lambda e^{-\lambda t}((u^A_t)^2) = 2e^{-\lambda t} u^A_t u^A_t,
\]

(3.16)

\[
\partial_t [e^{-\lambda t}((r^d_t)^2 + (\partial_t r^d_t)^2)] + \lambda e^{-\lambda t}((r^d_t)^2 + (\partial_t r^d_t)^2) = 2e^{-\lambda t} (r^d_t r^d_t + \partial_t r^d_t \partial_t r^d_t),
\]

and

\[
\partial_t v(F) = -\frac{n \eta(|F|^2)}{2} |F|^2 < \partial F, F > v(F),
\]

(3.17)

summing up \(\text{(3.4)}-\text{(3.7)}\), it holds

\[
\partial_t [e^{-\lambda t}((u^A_t)^2 + v(F) a^{Aij} \partial_i u^A \partial_j u^A + (u^A_t)^2 + (r^d_t)^2)]
\]

\[
+ \lambda e^{-\lambda t}((u^A_t)^2 + v(F) a^{Aij} \partial_i u^A \partial_j u^A + (u^A_t)^2 + (r^d_t)^2 + (r^d_t)^2)
\]

\[
-2e^{-\lambda t} \partial_t (v(F) a^{Aij} u^A_t \partial_j u^A)
\]

\[
= v(F) e^{-\lambda t} (\partial_t a^{Aij} \partial_i u^A \partial_j u^A - 2v(F) e^{-\lambda t} (\partial_t a^{Aij} u^A_t \partial_i u^A)
\]

\[
-2(\partial_t v(F) + \partial_t v(F)) e^{-\lambda t} a^{Aij} \partial_i u^A \partial_j u^A
\]

\[
+ 2v(F) e^{-\lambda t} a^{Aij} u^A_t \partial_i u^A + 2v(F) e^{-\lambda t} a^{Aij} u^A_t u^A
\]

\[
+ 2v(F) e^{-\lambda t} u^A_t N^A r + 2e^{-\lambda t} v(F) u^A_t Q^A u^A + 2e^{-\lambda t} u^A_t h^A
\]

\[
+ 2e^{-\lambda t} v(F) r^d_t M^d_t + 2e^{-\lambda t} v(F) r^d_t P^d u + 2e^{-\lambda t} r^d_t h^d.
\]

(3.18)
Note that \( v(F) \geq 1 \). Using Cauchy inequality, by (3.6)-(3.9), (3.10)-(3.11), (3.18) and Lemma 3.1, we derive

\[
\partial_t e^{-\lambda t}((u^A_t)^2) + v(F) a^{Aij} \partial_i u^A \partial_j u^A + (u^A)^2 + (r^d)^2 + (r^d)^2)
\]

\[
\leq c_3 v(F) e^{-\lambda t}[(u^A)^2 + (\partial_i u^A)^2 + (\partial_j u^A)^2 + (u^A)^2 + (r^d)^2 + (r^d)^2]
\]

\[
+c_4 \eta((F)^2) < \partial_t F + \partial_t F, F > v(F) e^{-\lambda t}[(\partial_i u^A)^2 + (\partial_j u^A)^2]
\]

\[
(3.19)
\]

\[
+ 4e^{-\lambda t}(\partial_i r^d)^2 + c_6 e^{-\lambda t}[(h^A)^2 + (h^d)^2].
\]

Then inequality (3.19) leads to

\[
\partial_t e^{-\lambda t}((u^A_t)^2) + a^{Aij} \partial_i u^A \partial_j u^A + (u^A)^2 + (r^d)^2 + (r^d)^2]
\]

\[
+ \left[ \lambda - c_3 v(F) - c_4 \eta((F)^2) F \right] < \partial_t F + \partial_t F, F > v(F) e^{-\lambda t}
\]

\[
\times [(u^A)^2 + a^{Aij} \partial_i u^A \partial_j u^A + (u^A)^2 + (r^d)^2 + (r^d)^2]
\]

\[
- 2e^{-\lambda t} \partial_t v(F) a^{Aij} u_i^A \partial_j u^A
\]

\[
\leq 4e^{-\lambda t}(\partial_i r^d)^2 + c_6 e^{-\lambda t}[(h^A)^2 + (h^d)^2].
\]

Thus integrating both side of above inequality on \([0, T] \times B_1(0)\), we obtain

\[
\int_{B_1(0)} e^{-\lambda t}[(u^A(T))^2] + a^{Aij} \partial_i u^A \partial_j u^A(T) + (u^A(T))^2 + (r^d(T))^2 + (r^d(T))^2]dx
\]

\[
+ \int_0^T \int_{B_1(0)} \left[ \lambda - c_3 v(F) - c_4 \eta((F)^2) F \right] < \partial_t F + \partial_t F, F > v(F) e^{-\lambda t}
\]

\[
\times [(u^A)^2 + a^{Aij} \partial_i u^A \partial_j u^A + (u^A)^2 + (r^d)^2 + (r^d)^2]dxdt
\]

\[
\leq \int_{B_1(0)} e^{-\lambda t}[(u^A_1)^2] + a^{Aij} \partial_i u_0^A \partial_j u^A_0 + (u^A_0)^2 + (r^d_0)^2 + (r^d_0)^2]dx
\]

\[
+ 4 \int_0^T \int_{B_1(0)} e^{-\lambda t}(\partial_i r^d)^2 + c_6 \int_0^T \int_{B_1(0)} e^{-\lambda t}[(h^A)^2 + (h^d)^2]dxdt.
\]

This completes the proof. 

\[ \square \]

**Lemma 3.4.** Let \((u^A, r^d)\) be a smooth solution to system (3.11)-(3.12) with initial data (3.3)-(3.4) \( F \in B_{R,T} \) is given. Assume that (1.3) and (3.10)-(3.12) hold. Then there exists a positive constant \( \lambda > c_7 \) such that

\[
(\lambda - c_7) \int_0^T \int_{B_1(0)} e^{-\lambda t}[(u^A)^2] + (\partial_i u^A)^2 + (u^A)^2 + (r^d)^2 + (r^d)^2]dxdt
\]

\[
\leq c_8 \int_{B_1(0)} e^{-\lambda t}[(u^A_0)^2] + (\partial_i u^A_0)^2 + (u^A_0)^2 + (\partial_i u^A)^2
\]

\[
+ (r^d_0)^2 + (\partial_i r^d_0)^2 + (r^d_0)^2 + (r^d_0)^2]dx
\]

\[
(3.20)
\]

\[
+ c_9 \int_0^T \int_{B_1(0)} e^{-\lambda t}[(h^A)^2] + (\partial_i h^A)^2 + (h^d)^2 + (\partial_i h^d)^2]dxdt.
\]
Proof. We introduce auxiliary functions \( \tilde{u}^A \) and \( \tilde{r}^d \), which satisfy
\[
\partial_t \tilde{u}^A - \partial_r \tilde{u}^A - \tilde{u}^A = h^A, \\
\tilde{u}^A(0, x) = u_0^A, \quad \partial_r \tilde{u}^A(0, x) = u_1^A,
\]
and
\[
\partial_t \tilde{r}^d - \partial_r \tilde{r}^d - \tilde{r}^d = h^d, \\
\tilde{r}^d(0, x) = r_0^d, \quad \partial_r \tilde{r}^d(0, x) = r_1^d.
\]
Let
\[
\tilde{u}^A = u^A - \tilde{u}^A,
\]
\[
\tilde{r}^d = r^d - \tilde{r}^d,
\]
then it follows from (3.1)-(3.2) and (3.21)-(3.22) that
\[
\partial_t \tilde{u}^A - v(F)L^A\tilde{u}^A - v(F)N^A\tilde{r} - v(F)Q^A\tilde{u}^A = \tilde{g}_1,
\]
\[
\tilde{u}^A(0, x) = 0, \quad \partial_r \tilde{u}^A(0, x) = 0,
\]
\[
\partial_t \tilde{r}^d - v(F)M^d\tilde{r} - v(F)P^d\tilde{u} = \tilde{g}_2,
\]
\[
\tilde{r}^d(0, x) = 0, \quad \partial_r \tilde{r}^d(0, x) = 0,
\]
where \( L^A, N^A, Q^A, M^d \) and \( P^d \) are defined in (3.5)-(3.9), and
\[
\tilde{g}_1 = v(F)L^A\tilde{u}^A + v(F)N^A\tilde{r} + v(F)Q^A\tilde{u}^A - \partial_r \tilde{u}^A - \tilde{u}^A,
\]
\[
\tilde{g}_2 = v(F)M^d\tilde{r} + v(F)P^d\tilde{u} - \partial_r \tilde{r}^d - \tilde{r}^d.
\]
Using the similar deriving process with (3.19), from (3.25) - (3.26) we get
\[
\partial_t [e^{-\lambda t}((\tilde{u}^A)^2)] + v(F)a^{Aij}\partial_i \tilde{u}^A \partial_j \tilde{u}^A + (\tilde{u}^A)^2 + (\tilde{r}^d)^2 + (\tilde{r}^d)^2
\]
\[
+ \lambda e^{-\lambda t}[((\tilde{u}^A)^2) + v(F)a^{Aij}\partial_i \tilde{u}^A \partial_j \tilde{u}^A + (\tilde{u}^A)^2 + (\tilde{r}^d)^2 + (\tilde{r}^d)^2] - 2e^{-\lambda t}\partial_i (v(F)a^{Aij}\tilde{u}^A_t \partial_j \tilde{u}^A) = v(F)e^{-\lambda t}(\partial_i a^{Aij}\tilde{u}^A_t \partial_j \tilde{u}^A)\]
\[
+ n \frac{\eta(|F|^2)}{|F|^2} < \partial_t F + \partial_r F, F > v(F)e^{-\lambda t}a^{Aij}\partial_i \tilde{u}^A \partial_j \tilde{u}^A + 2v(F)e^{-\lambda t}a^{Aij}\tilde{u}^A_t \partial_i \tilde{u}^A + 2v(F)e^{-\lambda t}u_t^A N^A\tilde{r} + 2e^{-\lambda t}v(F)u_t^AQ^A\tilde{u}^A + 2e^{-\lambda t}v(F)r_t^d M^A\tilde{r} + 2e^{-\lambda t}v(F)r_t^d P^d \tilde{u} + 2e^{-\lambda t}(\tilde{u}^A \tilde{r}_t^d + \tilde{r}_t^d \tilde{r}_t^d + \partial_t \tilde{r}_t^d) + 2e^{-\lambda t}\tilde{u}^A_t \tilde{g}_1 + 2e^{-\lambda t}\tilde{r}_t^d \tilde{g}_2.
\]
In order to avoid an extra loss of derivatives of integrating (3.29), we need to rewrite (3.29). By (3.27) - (3.28), the last two terms in (3.29) can be rewritten as
\[
e^{-\lambda t}(\tilde{u}_t^A \tilde{g}_1 + \tilde{r}_t^d \tilde{g}_2).
\]
Note that \( v(F) \geq 1 \). Inserting (3.30) into (3.29), integrating in \([0, T] \times B_1(0)\), then using Cauchy inequality we obtain

\[
\int_{B_1(0)} e^{-\lambda t}[(\tilde{u}_t^A(T))^2] + v(F) a^{Aij} \partial_t \tilde{u}_t^A(T) \partial_j \tilde{u}_t^A(T) + (\tilde{u}_t^A(T))^2 + (\tilde{r}_t^d(T))^2 + (\tilde{r}_t^d(T))^2 dx \\
+ \int_0^T \int_{B_1(0)} [\lambda - \frac{\eta(F)}{|F|^2}] < \partial_t F + \partial_t F, F > |v(F)| \\
\times e^{-\lambda t}[(\tilde{u}_t^A)^2 + v(F) a^{Aij} \partial_t \tilde{u}_t^A \partial_j \tilde{u}_t^A + (\tilde{u}_t^A)^2 + (\tilde{r}_t^d)^2 + (\tilde{r}_t^d)^2] dx dt \\
\leq \int_{B_1(0)} e^{-\lambda t} v(F)(\partial_t \tilde{u}_t^A(T))^2 dx \\
+ c_{10} n \int_0^T \int_{B_1(0)} e^{-\lambda t} \frac{\eta(F)}{|F|^2} < \partial_t F - \partial_t F, F > |v(F)|(\partial_t \tilde{u}_t^A)^2 dx dt \\
+ c_{11} \int_0^T \int_{B_1(0)} e^{-\lambda t} v(F)[(\partial_t \tilde{u}_t^A)^2 + (\partial_t \tilde{u}_t^A)^2 + (\tilde{u}_t^A)^2 + (\tilde{r}_t^d)^2 + (\tilde{r}_t^d)^2] dx dt \\
(3.31) + (\tilde{r}_t^d)^2 + (\tilde{r}_t^d)^2] dx dt.
\]

So it follows from (3.28)-(3.29) and (3.31) that

\[
\int_0^T \int_{B_1(0)} [\lambda - \frac{\eta(F)}{|F|^2}] < \partial_t F + \partial_t F, F > |v(F)| \\
\times e^{-\lambda t}[(\tilde{u}_t^A)^2 + v(F) a^{Aij} \partial_t \tilde{u}_t^A \partial_j \tilde{u}_t^A + (\tilde{u}_t^A)^2 + (\tilde{r}_t^d)^2 + (\tilde{r}_t^d)^2] dx dt \\
\leq \int_{B_1(0)} e^{-\lambda t} v(F)(\partial_t \tilde{u}_t^A(T))^2 dx + \int_0^T \int_{B_1(0)} [\lambda - \frac{\eta(F)}{|F|^2}] < \partial_t F + \partial_t F, F > |v(F)| \\
\times e^{-\lambda t}[(\tilde{u}_t^A)^2 + v(F) a^{Aij} \partial_t \tilde{u}_t^A \partial_j \tilde{u}_t^A + (\tilde{u}_t^A)^2 + (\tilde{r}_t^d)^2 + (\tilde{r}_t^d)^2] dx dt \\
+ c_{10} n \int_0^T \int_{B_1(0)} e^{-\lambda t} \frac{\eta(F)}{|F|^2} < \partial_t F - \partial_t F, F > |v(F)|(\partial_t \tilde{u}_t^A)^2 dx dt \\
+ c_{11} \int_0^T \int_{B_1(0)} e^{-\lambda t} v(F)[(\partial_t \tilde{u}_t^A)^2 + (\partial_t \tilde{u}_t^A)^2 + (\tilde{u}_t^A)^2 + (\tilde{r}_t^d)^2 + (\tilde{r}_t^d)^2] dx dt.
(3.32) + (\tilde{r}_t^d)^2 + (\tilde{r}_t^d)^2] dx dt.
\]

Multiplying (3.21) and (3.22) both side by \( 2e^{-\lambda t} \tilde{u}_t^A \) and \( 2e^{-\lambda t} \tilde{r}_t^d \), respectively, then integrating on \([0, T] \times B_1(0)\) and summing up two inequalities, we have

\[
\int_{B_1(0)} e^{-\lambda t}[(\tilde{u}_t^A(T))^2] + (\partial_t \tilde{u}_t^A(T))^2 + (\tilde{r}_t^d(T))^2 + (\partial_t \tilde{r}_t^d(T))^2 dx \\
+ \lambda \int_0^T \int_{B_1(0)} e^{-\lambda t}[(\tilde{u}_t^A)^2 + (\tilde{u}_t^A)^2 + (\tilde{r}_t^d)^2 + (\partial_t \tilde{r}_t^d)^2] dx dt \\
\leq c_{12} \int_{B_1(0)} e^{-\lambda t}[(u_0^A)^2 + (u_0^A)^2 + (r_0^d)^2 + (r_0^d)^2] dx \\
+ c_{13} \int_0^T \int_{B_1(0)} e^{-\lambda t}[(h^A)^2 + (h^d)^2] dx dt.
(3.33)
\]
Differentiating (3.21) with respect to \(x\), by the similar process of getting (3.33), we derive

\[
\int_{B_1(0)} e^{-\lambda t} [(\partial_t u^A(T))^2 + (\partial_t \tilde{r}^d(T))^2] dx + \lambda \int_0^T \int_{B_1(0)} e^{-\lambda t} [(\partial_t u^A)^2 + (\partial_t \tilde{r}^d)^2] dx dt 
\]

\[
\leq c_4 \int_{B_1(0)} e^{-\lambda t} [(u_0^A)^2 + \lambda h^A]^2 + (\partial_t u_0^A)^2 + |||F, F||| \lambda t \int_{B_1(0)} e^{-\lambda t} [(\partial_t \tilde{r}^d)^2] dx dt 
\]

\[
(3.34)
\]

On the other hand, we notice that

\[
|\eta| |F|^2 < \partial_t F + \partial_t F, F > \leq \|F\|_{L^\infty}^2 \|F\|_{C^0([0,T])} + \|F\|_{C^1([0,T])} \|F\|_{C^0([0,T])} \leq 2\|F\|_{L^2}^2 \leq R^{2p+2} < 1, \quad (3.35)
\]

\[
u(F) \leq \epsilon 2^{\frac{n}{2}} \int_0^T |\sigma|^p d\sigma \leq \epsilon 2^{\frac{n}{2}} \int_0^T \|F\|^2_{s,T} \leq \epsilon 2^{\frac{n}{2}} R^{2(2+p)}.
\]

Hence by (3.32), there exists a \(\lambda\) such that \(\lambda > 2^{\frac{n}{2}} R^{2(2+p)} > 1\) and

\[
(\lambda - e^{2^{\frac{n}{2}} R^{2(2+p)}}) \int_0^T \int_{B_1(0)} e^{-\lambda} [(u_0^A)^2 + e^{2^{\frac{n}{2}} R^{2(2+p)}} R^{2(2+p)} A^{ij} \partial_t u^A \partial_j u^A + (u^A)^2 + (r_0^d)^2 + (r^d)^2] dx dt 
\]

\[
\leq e^{2^{\frac{n}{2}} R^{2(2+p)}} \int_0^T \int_{B_1(0)} e^{-\lambda} [(\partial_t \tilde{u}^A)^2] dx dt + (\lambda - e^{2^{\frac{n}{2}} R^{2(2+p)}}) \int_0^T \int_{B_1(0)} e^{-\lambda} [(\tilde{u}^A)^2 + e^{2^{\frac{n}{2}} R^{2(2+p)}} R^{2(2+p)} A^{ij} \partial_t \tilde{u}^A \partial_j \tilde{u}^A + (\tilde{u}^A)^2 + (\tilde{r}_0^d)^2 + (\tilde{r}^d)^2] dx dt 
\]

\[
c_1 \epsilon e^{2^{\frac{n}{2}} R^{2(2+p)}} \int_0^T \int_{B_1(0)} e^{-\lambda} [(\partial_t \tilde{u}^A)^2] dx dt + c_1 \epsilon e^{2^{\frac{n}{2}} R^{2(2+p)}} \int_0^T \int_{B_1(0)} e^{-\lambda} [(\partial_t \tilde{u}^A)^2] dx dt 
\]

\[
(3.36)
\]

On the other hand, inequalities (3.33) - (3.34) give the control of four terms in the right hand side of (3.36). Thus substituting (3.33) - (3.34) in (3.36), we obtain (3.20).

This completes the proof. \(\square\)

In what follows, we plan to obtain the estimate for \(\|u^A\|_{s,T}\) and \(\|r^d\|_{s,T}\) by considering the equation of time space derivatives of \(u^A\) and \(r^d\). For convenience, we recall the norm \(\|u\|_{s,T} = \sup_{[0,T]} \sum_{i=0}^2 \sum_{\alpha=1}^{d^d} \sum_{A=1}^{d^d} \|\partial_t^i u^A_{(\alpha)}\|_{H^{s-i}(B_1(0))}\). For
any multi-index $\gamma \in \mathbb{Z}_+^d$ with $|\gamma| = s$, applying $\partial^\gamma_t$ to both sides of (3.1) and (3.2) to get

\begin{equation}
\partial_t \partial^\gamma_t u^A - v(F)L^A \partial^\gamma_t u^A - v(F)N^A \partial^\gamma_t r - v(F)Q^A \partial^\gamma_t u^A = h^A_t,
\end{equation}

\begin{equation}
\partial_t \partial^\gamma_t r - v(F)M^d \partial^\gamma_t r - v(F)P^d \partial^\gamma_t u = h^d_t,
\end{equation}

where the nonlinear terms

\begin{align*}
h^A_t &= \partial^\gamma_t h^A + \sum_{s_1 + s_2 = \gamma, |s_1| \geq 1} \partial^{s_1}_t(v(F)a^{A_1}) \partial_i \partial_j \partial^{s_2}_t u^A + \sum_{s_1 + s_2 = \gamma, |s_1| \geq 1} \partial^{s_1}_t(v(F)a^{A_1}) \partial_i \partial_j \partial^{s_2}_t u^A \\
&\quad + \sum_{s_1 + s_2 = \gamma, |s_1| \geq 1} \partial^{s_1}_t(v(F)n^{A_1}_j) \partial_i \partial_j \partial^{s_2}_t u^A + \sum_{s_1 + s_2 = \gamma, |s_1| \geq 1} \partial^{s_1}_t(v(F)n^{A_1}_j) \partial_i \partial_j \partial^{s_2}_t r^j \\
&\quad + \sum_{s_1 + s_2 = \gamma, |s_1| \geq 1} \partial^{s_1}_t(v(F)n^{A_1}_j) \partial_i \partial_j \partial^{s_2}_t u^B + \sum_{s_1 + s_2 = \gamma, |s_1| \geq 1} \partial^{s_1}_t(v(F)n^{A_1}_j) \partial_i \partial_j \partial^{s_2}_t u^B \\
&\quad + \sum_{s_1 + s_2 = \gamma, |s_1| \geq 1} \partial^{s_1}_t(v(F)n^{A_1}_j) \partial_i \partial_j \partial^{s_2}_t u^B
\end{align*}

\begin{equation}
(3.39) + \sum_{s_1 + s_2 = \gamma, |s_1| \geq 1} \partial^{s_1}_t(v(F)q^{A_1}) \sum_{\beta = 1}^J \frac{\partial^{s_2}_t(e^{A_1}_\beta)d\mu}{\partial^{s_2}_t u^{A_1}_\beta}
\end{equation}

and

\begin{align*}
h^d_t &= \partial^\gamma_d h^d + \sum_{s_1 + s_2 = \gamma, |s_1| \geq 1} \partial^{s_1}_t(v(F)m^{d_1}_j) \partial_i \partial_j \partial^{s_2}_t d^i + \sum_{s_1 + s_2 = \gamma, |s_1| \geq 1} \partial^{s_1}_t(v(F)m^{d_1}_j) \partial_i \partial_j \partial^{s_2}_t \gamma^i \\
&\quad + \sum_{s_1 + s_2 = \gamma, |s_1| \geq 1} \partial^{s_1}_t(v(F)m^{d_1}_j) \partial_i \partial_j \partial^{s_2}_t u^B + \sum_{s_1 + s_2 = \gamma, |s_1| \geq 1} \partial^{s_1}_t(v(F)m^{d_1}_j) \partial_i \partial_j \partial^{s_2}_t u^B.
\end{align*}

\begin{equation}
(3.40) + \sum_{s_1 + s_2 = \gamma, |s_1| \geq 1} \partial^{s_1}_t(v(F)P^{d_1}_\beta)) \partial_i \partial_j \partial^{s_2}_t u^B + \sum_{s_1 + s_2 = \gamma, |s_1| \geq 1} \partial^{s_1}_t(v(F)P^{d_1}_\beta) \partial_i \partial_j \partial^{s_2}_t u^B.
\end{equation}

For convenience, we denote all spatial derivatives of $u^A$ and $r^d$ of the order $s$ by a column vector of $m(s)$ components and $n(s)$ components

\begin{align*}
u^T &= (\partial^s u^A, \partial^{s-1} \partial_2 u^A, \ldots, \partial^s u^A), \\
r^T &= (\partial^s r^d, \partial^{s-1} \partial_2 r^d, \ldots, \partial^s r^d).
\end{align*}

Putting (3.37)-(3.38) together corresponding to all $\gamma$ with $|\gamma| = s$, we have

\begin{equation}
\partial_t u_{s} - v(F)\tilde{L}^A u_{s} - v(F)\tilde{N}^A r_{s} - v(F)\tilde{Q}^A u_{s} = \tilde{h}^A_{\gamma},
\end{equation}

\begin{equation}
\partial_t r_{s} - v(F)\tilde{M}^d r_{s} - v(F)\tilde{P}^d u_{s} = \tilde{h}^d_{\gamma},
\end{equation}

where

\begin{align*}
\tilde{L}^A u_{s} &= \tilde{a}^{Aij} \partial_i \partial_j u_{s} + \tilde{a}^{A}\partial_3 u_{s} + \tilde{a}^{A} u_{s}, \\
\tilde{N}^A r_{s} &= \tilde{n}^{Aij} \partial_i r_{s} + \tilde{n}^{A}\partial_3 r_{s} + \tilde{n}^{A0} \partial_3 r_{s} + \tilde{n}^{A1} \sum_{\beta = 1}^J \int \tilde{e}^A_{(\beta)j} r_{s(\beta)} d\mu, \\
\tilde{Q}^A u_{s} &= \tilde{q}^{Aij} \partial_i u_{s} + \tilde{q}^{A}\partial_3 u_{s} + \tilde{q}^{A0} \partial_3 u_{s} + \tilde{q}^{A1} \sum_{\beta = 1}^J \int \tilde{e}^A_{(\beta)j} u_{s(\beta)} d\mu,
\end{align*}
\[ \ddot{M}^d r_s = \ddot{m}_d^d r_s + \ddot{m}_d^d \partial_t r_s , \]
\[ \ddot{P}^d u_s = \ddot{P}_B^d \partial_j u_s + \ddot{P}_B^d \partial_t u_s . \]

with all the coefficients in \( L^A, \tilde{N}^A, \tilde{Q}^A, \tilde{M}^d \) and \( \tilde{P}^d \) are \((m \times m)\)-matrices and \( \tilde{h}^A_i \) and \( \tilde{h}_i^A \) are m-vectors given by

\[
\begin{align*}
\tilde{h}^A_i &= (h^A_{(s,0,...,0)}, h^A_{(s-1,1,...,0)}, \cdots, h^A_{(0,0,...,s)})^T, \\
\tilde{h}_i^A &= (h^A_{(s,0,...,0)}, h^A_{(s-1,1,...,0)}, \cdots, h^A_{(0,0,...,s)})^T.
\end{align*}
\]

**Lemma 3.5.** Let \((u^A, r^d)\) be a smooth solution to (3.1)-(3.2) with initial data \((3.3)-(3.4)\). \( F \in \mathcal{B}_{R,T} \) is given. Assume that (3.3) and \((3.14)-(3.15)\) hold. Then for \( s \geq 2 \), there holds

\[
\begin{align*}
|||u^A|||_{s,T} + |||r^d|||_{s,T} &\leq c_{19} (|||u^A|||_{s+1,T} + |||u^A|||_{s+1,T} + |||r^d|||_{s+1,T}) \\
&+ |||h^A|||_{s,T} + |||h^d|||_{s,T} ,
\end{align*}
\]

(3.43)

where \( c_{19} \) depends on \( T \).

**Proof.** The proof is based on the induction. For \( s = 1 \),Lemma 3.3 gives the case by choosing a suitable \( \lambda \). We assume that \((3.3)\) holds for all \( 1 \leq j \leq s \), and we prove that \((3.3)\) holds for \( s + 1 \). Since \((3.1)-(3.2)\) has the same structure with \((3.1)-(3.2)\), the result in Lemma 3.3 can be used directly. Note that the vector \( D^u A \) and \( D^u d \) satisfy \((3.11)-(3.12)\). By (3.20), we have

\[
\begin{align*}
(3.44) + c_{22} \sum_{|\gamma|=s} \int_{B_1(0)} &\int_{B_1(0)} e^{-\lambda t} (|h^A_\gamma|^2 + |h^d_\gamma|^2 + |\partial_t h^A_\gamma|^2 + |\partial_t h^d_\gamma|^2) dx dt.
\end{align*}
\]

By \((3.35)-(3.39)\), we drive

\[
|\partial^2_t h^A|^2 + |\partial^2_t h^d|^2 \leq |\partial^2_t h^A|^2 + |\partial^2_t h^d|^2 + |\partial^2_t h^d|^2 + |\partial^2_t h^d|^2 + |\partial^2_t h^d|^2 + |\partial^2_t h^d|^2 + |\partial^2_t h^d|^2 + |\partial^2_t h^d|^2 .
\]

(3.45)

So choosing a \( \lambda \geq c_{20} + c_{24} + 1 \) large enough, it follows from (3.44) and (3.45) that

\[
\begin{align*}
(3.44) + c_{23} \sum_{|\gamma|=s} \int_{B_1(0)} &\int_{B_1(0)} e^{-\lambda t} (|h^A_\gamma|^2 + |h^d_\gamma|^2 + |\partial_t h^A_\gamma|^2 + |\partial_t h^d_\gamma|^2) dx dt.
\end{align*}
\]

which implies that

\[
\begin{align*}
|||\partial^2_t h^A_\gamma|||_{L^2(B_1(0))} + ||| \partial^2_t h^d_\gamma|||_{L^2(B_1(0))} + |||\partial_t h^A_\gamma|||_{L^2(B_1(0))} + |||\partial_t h^d_\gamma|||_{L^2(B_1(0))}.
\end{align*}
\]
4.1. Euclidean case. Above system is a linear wave equation coupled with ODEs. By a standard fixed point iteration and similar estimates in Lemma 3.5, we can prove that with initial data
\begin{equation}
\tag{3.48}
(3.48)
\end{equation}
we can iterate. Let
\begin{equation}
\tag{3.49}
(3.49)
\end{equation}
\end{equation}
with initial data
\begin{equation}
\tag{3.47}
(3.47)
\end{equation}
we conclude that
\begin{equation}
\tag{3.46}
(3.46)
\end{equation}
Furthermore, we can apply $\partial^2_t\partial_{t}^{s+1-j}u$ to both sides of (3.1)-(3.2) for $2 \leq j \leq s+1$, then deriving a similar estimate with (3.46). We conclude that
\begin{equation}
\tag{3.47}
(3.47)
\end{equation}
Summing up the estimate (3.47) over all coordinate charts, and we notice that $\|u\|_s$ is equivalent to $\|u\| + \|\partial_t u\|_s$, hence (3.48) can be derived by (3.47). This completes the proof.
\[ \square \]

We notice that $h = u^d\nu_A + r^d\nu_d$, and $W = h^d\nu_A + h^d\nu_d$, so by Lemma 3.5, by direct computation we can obtain the following result.

**Lemma 3.6.** Let $h$ be a smooth solution to weakly linear hyperbolic system (3.1)-(3.2) with initial data $h(0) = h_0$ and $\partial_th(0) = h_1$. $F \in B_{R,T}$ is given. Assume that (1.3) and (3.10)-(3.12) hold. Then for $s \geq \text{max}\{2, \frac{n}{4}\}$, there holds
\begin{equation}
\tag{3.48}
\end{equation}

**Proof of Proposition 3.1.** The proof is based on a standard fixed point iteration. Let $h = u^d\nu_A + r^d\nu_d$ and $W = h^d\nu_A + h^d\nu_d$. We consider the following approximation system of (3.1)-(3.2) as
\begin{equation}
\begin{aligned}
\partial_t u^A_{m+1}(t) &= v(F)L_{m} u^A_{m+1}(t) - v(F)\partial_t A_{m}(t) - v(F)Q_{m} u^A_{m}(t) = h^A, \\
\partial_t r^d_{m+1}(t) &= v(F)M_{m} r^d_{m}(t) - v(F)P_{m} u^d_{m}(t) = h^d,
\end{aligned}
\end{equation}
with initial data
\begin{equation}
\begin{aligned}
u^A_{m+1}(t) &= u^A_{0}, \quad r^d_{m+1}(t) = r^d_{0}, \\
\partial_t u^A_{m+1}(t) &= u^A_{0} = h_1, \quad \nu_B(0) > v^A B(0) - u^C_{0} < \partial_t v_C(0), \quad \nu_B(0) > v^A B(0)
\end{aligned}
\end{equation}
\begin{equation}
\begin{aligned}
u^d_{m+1}(t) &= r^d_{0} < \partial_t r_m(0), \quad \nu_B(0) > v^A B(0), \\
\partial_t r^d_{m+1}(t) &= r^d_{0} < \partial_t r_m(0), \quad \nu_B(0) > v^A B(0). \\
\end{aligned}
\end{equation}

Above system is a linear wave equation coupled with ODEs. By a standard fixed point iteration and similar estimates in Lemma 3.5, we can prove that it has a local smooth solution on $[0, T]$. For the existence of solution for general linear wave equation, one can see [14, 15, 20] for more details.

4. **Proof of Theorem 1.1**

4.1. **Euclidean case.** In this section, we construct a solution $F(t, x)$ on $[0, T]$ of equation (1.2) by a Nash-Moser iteration scheme. In order to show the proof process of Theorem 1.1 clearly and simply, we first deal with the case of Euclidean case $\mathcal{M} = \mathbb{R}^{d+1}$. Then we consider the general case.
Introduce an auxiliary function \[ (4.2) \]

that with initial data \[ (4.1) \]

we define \[ (4.5) \]

then the initial value problem \[ (4.1)-(4.2) \] is equivalent to \[ (4.3) \]

for \[ (4.4) \] with initial data \[ (4.5) \].

Rescaling in \[ (1.2) \] amplitude and time as

\[
F(t, x) \mapsto \varepsilon F(\sqrt{\varepsilon}t, x), \quad \varepsilon > 0,
\]

we are to prove the existence solution on \([0, T] \times \Sigma\) of

\[
\partial_t F = \varepsilon^{n-1} \frac{d\mu}{d\mu} v(\varepsilon F)(-H(\varepsilon F) + \varepsilon \varphi(\varepsilon F) F)
\]

(4.1)

\[- \varepsilon^2 \varphi(\varepsilon F) \nabla \left( \frac{|F|^2}{2} \right) + \frac{\rho}{Vol(\varepsilon F)} \nu,\]

with initial data

\[
F(0, \cdot) = F_0, \quad \partial_t F(0, \cdot) = F_1.
\]

Introduce an auxiliary function

(4.3)

\[
\overline{F} = F - F_0 - t F_1,
\]

then the initial value problem \[ (4.1)-(4.2) \] is equivalent to

\[
\partial_t \overline{F} = \varepsilon^{n-1} \frac{d\mu}{d\mu} v(\varepsilon (\overline{F} + F_0 + t F_1))(-H(\varepsilon (\overline{F} + F_0 + t F_1)) + \varepsilon (\overline{F} + F_0 + t F_1) \varphi(\varepsilon (\overline{F} + F_0 + t F_1))
\]

(4.4)

\[- \varepsilon^2 \varphi(\varepsilon (\overline{F} + F_0 + t F_1)) \nabla \left( \frac{|\overline{F} + F_0 + t F_1|^2}{2} \right) + \frac{\rho}{Vol(\varepsilon (\overline{F} + F_0 + t F_1))} \nu,\]

with zero initial data

(4.5)

\[
\overline{F}(0, \cdot) = 0, \quad \partial_t \overline{F}(0, \cdot) = 0.
\]

We define

\[
\mathcal{N}(\overline{F}) := \partial_t \overline{F} - \varepsilon^{n-1} \frac{d\mu}{d\mu} v(\varepsilon (\overline{F} + F_0 + t F_1))(-H(\varepsilon (\overline{F} + F_0 + t F_1)) + \varepsilon (\overline{F} + F_0 + t F_1) \varphi(\varepsilon (\overline{F} + F_0 + t F_1))
\]

(4.6)

\[- \varepsilon^2 \varphi(\varepsilon (\overline{F} + F_0 + t F_1)) \nabla \left( \frac{|\overline{F} + F_0 + t F_1|^2}{2} \right) + \frac{\rho}{Vol(\varepsilon (\overline{F} + F_0 + t F_1))} \nu,\]

then our target is to construct a \( \overline{F}(\sqrt{\varepsilon}t, x) \in B_{\overline{R}, T} \) on the time interval \([0, T]\) such that \( \mathcal{N}(\overline{F}) = 0 \). Here \( \sqrt{\varepsilon}t \in [0, T] \). Thus we obtain the existence of smooth solution for \[ (4.4) \] with initial data \[ (4.5) \]. In fact, we treat the initial value problem \[ (4.1)-(4.5) \] iteratively as a small perturbation of the initial value problem for a weakly linear hyperbolic system. Linearizing nonlinear equation \[ (4.4) \], we obtain the linearized operator

\[
\partial_{\overline{F}} \mathcal{N}(\overline{F}) h := \partial_{\overline{F}} h - \varepsilon^{n-1} \frac{d\mu}{d\mu} v(\varepsilon (\overline{F} + F_0 + t F_1))[(\triangle < h, \nu > + |\overline{h}|^2 < h, \nu > - < \nabla H, h^\top > )
\]

\[ + \varepsilon h \varphi(\varepsilon (\overline{F} + F_0 + t F_1)) + \varepsilon (\overline{F} + F_0 + t F_1)(\partial_{\overline{F}} \varphi) h)
\]

\[- \varepsilon^2 (\partial_{\overline{F}} \varphi) h \nabla \left( \frac{|\overline{F} + F_0 + t F_1|^2}{2} \right) - \varepsilon^2 \varphi(\varepsilon (\overline{F} + F_0 + t F_1)) \nabla < \overline{F} + F_0 + t F_1, h >
\]

\[ + \frac{\rho}{Vol(\varepsilon (\overline{F} + F_0 + t F_1))^2} \int_{\Sigma} < h, \nu > d\mu h
\]

\[- \varepsilon^{n-1} \frac{d\mu}{d\mu} v(\varepsilon (\overline{F} + F_0 + t F_1))[-H(\varepsilon (\overline{F} + F_0 + t F_1))]
\]
where \( \hat{h}_{ij} \) denote the second fundamental form, \( \partial_{\mathcal{F}} \) denotes the Fréchet derivative to \( \mathcal{F} \) and we use the following relations

\[
- \partial_{\mathcal{F}} H = \triangle < h, \nu > + |\hat{h}|^2 < h, \nu > - < \nabla H, h^\top >, \\
\partial_{\mathcal{F}} \mu = (\text{div} h^\top + < h, \nu > H) \mu, \\
\partial_{\mathcal{F}} \nu = \nabla < h, \nu > - < h, \partial_{\mathcal{F}} > h^{ij} \partial_{\mathcal{F}} F, \\
\partial_{\mathcal{F}} (\varphi(\mathcal{F} + F_0 + tF_1)) = -\varphi'(\hat{s}) \varphi(\mathcal{F} + F_0 + tF_1)) < |\mathcal{F} + F_0 + tF_1|, h >.
\]

For the nonlinear term, by \((4.4)\) and \((4.7)\), direct computations show that

\[
R(h) := N(\mathcal{F} + h) - N(\mathcal{F}) - \partial_{\mathcal{F}} N(\mathcal{F}) h.
\]

Since the exact form of nonlinear term \((4.8)\) is very complicated, here we does not write it down. In fact, we notice that the solution of \((4.4)\) is to be constructed in \(B^s_{R,T} \) and \(\mathcal{F} \in B^s_{R,T} \), so we have

\[
|||\mathcal{F}|||_{s,T} \leq R < 1, \\
|||h|||_{s,T}^2 \leq |||h|||_{s+2,T}^2, \forall q \geq 2.
\]

Thus we only need to obtain the lowest exponent of \( h \) for convenience. Then by the product inequality, we can obtain the following result, i.e. Lemma 4.1. Note that

\[
v(s) = \exp(-\frac{s}{2} \int_1^s \eta(u) du), \quad d\mu = \sqrt{\det(g_{ij})} Vol(F) = Vol_0 + \int_1^t \partial_t F, \nu > d\mu ds \quad \text{and} \quad \nu = \frac{\partial F_{11} \ldots \partial F_{ij}}{\partial F_{11} \ldots \partial F_{1j}}.
\]

Direct computation shows that the lowest exponent of \( \mathcal{F} \) is \( n + 1 \) in \((4.8)\), which is determined by the lowest exponent of \( \mathcal{F} \) in \( d\mu \). This lowest exponent of \( h \) in \((4.3)\) equals to the lowest exponent of \( \mathcal{F} \) in \((4.4)\), i.e. \( n + 1 \).

**Lemma 4.1.** Let \( \mathcal{F}, \; h \in B^s_{R,T} \). For any \( s > \max\{2, \frac{n}{2} \} \), there holds

\[
|||R(h)|||_{s,T} \leq c_{29} |||h|||_{s+2,T}^{n+1},
\]

where \( c_{29} \) depends on the constant \( R \).

In order to prove the existence of smooth solution for the linearized equation, we can follow \([13]\) to decompose \( h \) and the external force \( W(t, x) \) into the normal and tangential parts. Then direct computation shows that the linearized equation has
the same form as the weakly linear hyperbolic system \(3.1 - 3.2\). So by Proposition 3.1 and Lemma 3.5, we obtain the following result.

**Lemma 4.2.** Let \( \overline{F} \in B_{R,T}' \). For any \( s > \max\{2, \frac{n}{2}\} \), there exists a function \( h \in B_{R,T}' \) such that

\[
\begin{align*}
\partial_\nu N(\overline{F})h &= W(t, x), \\
h(0, \cdot) &= 0,
\end{align*}
\]

Moreover, there holds

\[
|||h|||_{s,T} \leq c_0 |||W|||_{s,T}.
\]

Next we introduce the smooth truncation function, one can see [18] for more details. Let \( \Pi_\theta \in C^\infty(\mathbb{R}) \) such that \( \Pi_\theta = 0 \) for \( \theta < 0 \) and \( \Pi_\theta \to 1 \) for \( \theta \to \infty \). we introduce a family of smooth functions \( S(\theta') \) with \( S(\theta') = 0 \) for \( \theta' \leq 0 \) and \( S(\theta') = 1 \) for \( \theta' \geq 1 \). For \( W \in C^\infty_T \), we define

\[
\Pi_{|x'| - |x|}W(t, x) = S(|x' - |x||W(t, x), \ x, x' \in \mathbb{R}^n.
\]

For \( l = 0, 1, 2, \ldots \), by setting

\[
|x'| := l = 2^l,
\]
then by the Fourier transform is an isomorphism between \( L^2_s \) and \( H^s \), it is directly to check that

\[
\begin{align*}
|||\Pi_{|x'| - |x|}W|||_{H^{s_1}} &\leq c_{s_1, s_2}N_l^{s_1 - s_2}|||W|||_{H^{s_2}}, \ \forall \ s_1, s_2 \geq 0, \\
|||\Pi_{|x'| - |x|}W - W|||_{H^{s_2}} &\leq c_{s_1, s_2}N_l^{s_1 - s_2}|||W|||_{H^{s_2}}, \ \forall \ 0 \leq s_1 \leq s_2.
\end{align*}
\]

For convenience, we denote \( \Pi_{|x'| - |x|} \) by \( \Pi_{N_l} \). We approximate system (4.9), and get the following approximation system

\[
G_{N_l}(\overline{F}) := \partial_t \overline{F} - \varepsilon^{n-1}\Pi_{N_l} \frac{d\mu}{d\mu} \varepsilon(\overline{F} + F_0 + tF_1))\varphi(\varepsilon(\overline{F} + F_0 + tF_1))) \\
- \varepsilon^2 \varphi(\varepsilon(\overline{F} + F_0 + tF_1))\nabla(\frac{(\overline{F} + F_0 + tF_1)^2}{2}) + \frac{\rho}{Vol(\varepsilon(\overline{F} + F_0 + tF_1))} \nu,
\]

where \( m = 0, 1, \ldots, l, \ldots \).

The following Lemma is to construct the “l th” step approximation solution.

**Lemma 4.3.** There exists a linear map \( \Phi : C^\infty_T \to C^\infty_T \) such that

\[
\Phi(\overline{F}^l) = \overline{F}^l + h^{l+1},
\]

where \( \overline{F}^l = \sum_{i=0}^l h^i \) is the solution of the initial value problem

\[
\begin{align*}
E^l + \partial_\nu N(\overline{F})h^{l+1} &= 0, \\
h^{l+1}(0, x) &= 0, \ \partial_t h^{l+1}(0, x) = 0,
\end{align*}
\]

and \( E^l \) satisfies

\[
E^l = G_{N_l}(\overline{F}^l) = G_{N_l}(\Phi \circ \cdots \circ \Phi(\overline{F}^0)).
\]

Moreover, for \( s > \max\{2, \frac{n}{2}\} \), it holds

\[
|||h^{l+1}|||_{s,T} \leq c_{31} |||E^l|||_{s,T}.
\]
Proof. Assume that a suitable "0th step" approximation solution of (4.13) has been chosen, which is \( W^0 \neq 0 \). The "lth step" approximation solution is denoted by

\[
F^l = \sum_{i=0}^{l} h^i.
\]

Define

\[
E^l = \partial_t F^l - \varepsilon^{n-1} \Pi N_l \frac{d\mu}{d\mu} v(\varepsilon(F^l + F_0 + tF_1))[-H(\varepsilon(F^l + F_0 + tF_1))
\]

\[
+ \varepsilon(F^l + F_0 + tF_1) \varphi(\varepsilon(F^l + F_0 + tF_1))
\]

\[
- \varepsilon^2 \varphi(\varepsilon(F^l + F_0 + tF_1)) \nabla(\frac{|F^l + F_0 + tF_1|^2}{2}) + \frac{\rho}{Vol(\varepsilon(F^l + F_0 + tF_1))}|\nu
\]

Then we plan to find the "lth step" approximation solution \( F^{l+1} \). By (4.13), we have

\[
G(F^l + h^{l+1}) = \partial_t F^l + \partial_t h^{l+1} - \varepsilon^{n-1} \Pi N_{l+1} \frac{d\mu}{d\mu} v(\varepsilon(F^l + h^{l+1} + F_0 + tF_1))
\]

\[
\times [-H(\varepsilon(F^l + h^{l+1} + F_0 + tF_1)) + \varepsilon(F^l + F_0 + tF_1) \varphi(\varepsilon(F^l + h^{l+1} + F_0 + tF_1))
\]

\[
- \varepsilon^2 \varphi(\varepsilon(F^l + F_0 + tF_1)) \nabla(\frac{|F^l + h^{l+1} + F_0 + tF_1|^2}{2})
\]

\[
+ \frac{\rho}{Vol(\varepsilon(F^l + h^{l+1} + F_0 + tF_1))}|\nu
\]

(4.15) \quad (4.16)

where

\[
R(h^{l+1}) = -\varepsilon^{n-1} \Pi N_{l+1} \left( N(F^l + h^{l+1}) - N(F^l) - \partial_{\nu} N(F^l) h^{l+1} \right).
\]

By Lemma 4.2, there exists a solution \( h^{l+1} \) of

\[
E^l + \partial_{\nu} N(F^l) h^{l+1} = 0,
\]

\[
h^{l+1}(0, \cdot) = 0, \quad \partial_t h^{l+1}(0, \cdot) = 0.
\]

A similar estimate with (4.10) is derived as

\[
||h^{l+1}||_{s,T} \leq c_{31} ||E^l||_{s,T}.
\]

Furthermore, one can know from (4.16) and (4.17) that

\[
E^{l+1} = R(h^{l+1}).
\]

(4.18)

For \( \max\{2, \frac{\beta}{2} \} \leq \tilde{s} < s_0 \leq s \), set

\[
s_l := \tilde{s} + \frac{s - \tilde{s}}{2^l},
\]

(4.19)

\[
\alpha_{l+1} := s_l - s_{l+1} = \frac{s - \tilde{s}}{2^{l+1}}.
\]

(4.20)

By (4.19)-(4.20), it follows that

\[
s_0 > s_1 > \ldots > s_l > s_{l+1} > \ldots.
\]
Theorem 4.4. Equation (4.1) with initial data (4.2) has a solution
\[ F = F_\infty + F_0 + F_1 t, \]
where \( F_\infty \) has the form
\[ F_\infty = \sum_{i=0}^{\infty} h_i \in C^\infty_T. \]

Proof. The proof is based on the induction. For any \( l = 0, 1, 2, \ldots \), we claim that there exists a constant \( 0 < d < 1 \) such that
\[ ||h_l+1||_{s_{l+1}, T} < d^{l+1}, \]
\[ ||E_l+1||_{s_{l+1}} \leq d^{l+1}, \]
\[ F_l+1 \in B_{R,T}. \]

We choose a fixed sufficient small \( F_0 > 0 \) such that
\[ ||F_0||_{s_0} \ll 1, ||E_0||_{s_0} \ll 1. \]

For the case \( l = 0 \), by (4.14), we have
\[ ||h^1||_{s_1, T} \leq c_{31} ||E^0||_{s_1, T} \leq c_{31} ||E^0||_{s_0, T} < 1. \]

It follows from (4.9), (4.12), (4.17) and (4.18) that
\[ ||E^1||_{s_1, T} \leq ||R(h^1)||_{s_1, T} \leq c_{32} \varepsilon^{n-1} N^{n+1}_l ||h^1||_{s_1, T} \]
\[ \leq c_{33} (2\varepsilon ||E^0||_{s_0, T})^{n+1}. \]

It is obviously to see that (4.20) gives (4.21) by choosing suitable small \( \varepsilon > 0 \). So we get \( F^1 \in B_{R,T}^n \).

Assume that (4.22)-(4.24) holds for \( 1 \leq i \leq l \), i.e.
\[ ||h_i||_{s_i, T} < 1, \]
\[ ||E_i||_{s_i} \leq d^i, \]
\[ F^i \in B_{R,T}^n. \]

Now we prove that (4.22)-(4.24) holds for \( l + 1 \). From (4.14) and (4.28), we have
\[ ||h^{l+1}||_{s_{l+1}, T} \leq c_{31} ||E^l||_{s_l, T} < c_{31} d^l < 1. \]

It follows from (4.9), (4.12), (4.17) and (4.18) that
\[ ||E^{l+1}||_{s_{l+1}, T} \leq ||R(h^{l+1})||_{s_{l+1}, T} \]
\[ \leq c_{34} \varepsilon^{n-1} N^{n+1}_{l+1} ||h^{l+1}||_{s_{l+1}, T} \]
\[ \leq c_{34} \varepsilon^{n-1} N^{n+1}_{l+1} ||E^l||_{s_{l+1}, T} \]
\[ \leq c_{34} \varepsilon^{n-1} N^{n+1}_{l+1} ||E^{l-1}||_{s_{l-1}, T} \]
\[ \leq \ldots \]
\[ \leq c_{35} (16\varepsilon ||E^0||_{s_0, T})^{(n+1)^{l+1}}. \]

We can choose a fixed sufficient small \( \varepsilon > 0 \) such that
\[ 0 < 16\varepsilon ||E^0||_{s_0, T} < 1. \]
Thus we conclude that (4.22), (4.23) holds. Note that \( \mathbf{F}^l = \sum_{i=0}^l h^i \). So (4.22) gives (4.24).

Therefore, we derive

\[
\lim_{l \to \infty} \| \mathbf{E}^l \|_{l,T} = 0,
\]

which implies that system (4.4) with zero initial data has a solution

\[
\mathbf{F}_\infty = \sum_{i=0}^\infty h_i \in C^s_T.
\]

At last, by (4.3) we obtain the solution of system (4.1) with initial data (4.2) has a solution

\[
F = \mathbf{F}_\infty + F_0 + F_1 t.
\]

\[\square\]

4.2. General Case. By Nash’s embedding theorem we may embed \((M,g)\) isometrically into an Euclidean space \(R^k\) by \(f : M \to R^k\) for some large \(k\). Then we use the similar method of [15, 19] to derive an extrinsic form of the Euler-Lagrange equation (1.2).

We denote \(\Psi_M\) as the closest point projection to \(f(M)\), it is defined on a neighborhood \(\tilde{M} = \{x + y | x \in f(M), y \in (T_x f(M))^\perp, \ |y| < \delta(x)\}\), of \(f(M)\) and is smooth there. Here \(\delta(x)\) denotes a positive smooth function on \(f(M)\). Since the second fundamental form \(\tilde{h}_{\alpha\beta}\) of \(M\) is normal to \(f(M)\) and \(f = \Psi_M \circ f\), we get

\[
(4.31) \quad \tilde{\alpha}_\alpha \tilde{\beta}_\gamma f - \tilde{\Gamma}^\gamma_{\alpha\beta} f = D_A D_B \Psi_M \tilde{\gamma}_{\alpha\beta} f^A \tilde{\gamma}_{\alpha} f^B,
\]

where \(D_A\) and \(D_B\) denote the derivative in the direction of the canonical basis vector \(e_A\) and \(e_B\) in \(R^k\), respectively.

Let \(\tilde{F} : [0,T] \times \Sigma \to M\) and \(F : [0,T] \times \Sigma \to f(M)\) with \(F = f(\tilde{F})\). Note that \(F\) is an isometric embedding. Then by (4.31), direct computation shows that

\[
\square_g F - \frac{d\mu}{d\nu} v(F) \frac{\rho}{\text{vol}(F)} \varphi(F) - D_A D_B \Psi_M(F) \left( \partial_i F^A \partial_i F^B - \frac{d\mu}{d\nu} v(F) g^{ij} \partial_i F^A \partial_j F^B \right)
\]

\[
= D_f \left( \tilde{\nabla}_i \partial_i \tilde{F} - \frac{d\mu}{d\nu} v(F) \left( -H(\tilde{F}) + \tilde{\varphi} \tilde{F} - \tilde{\varphi} \nabla \left( \frac{\tilde{F}^2}{2} \right) + \frac{\rho}{\text{vol}(F)} \right) \nu(F) \right),
\]

where

\[
\square_g F = \partial_i F - \frac{d\mu}{d\nu} v(F) g^{ij} (\partial_j \partial_i F - \Gamma^l_{ij} \partial_l F).
\]

Hence \(\tilde{F}\) is a solution of (1.2) if and only if \(F\) is the solution of

\[
(4.32) \quad \square_g F - \frac{d\mu}{d\nu} v(F) \frac{\rho}{\text{vol}(F)} \varphi(F) - D_A D_B \Psi_M(F) \left( \partial_i F^A \partial_i F^B - \frac{d\mu}{d\nu} v(F) g^{ij} \partial_i F^A \partial_j F^B \right)
\]

\[
= D_f \left( \tilde{\nabla}_i \partial_i \tilde{F} - \frac{d\mu}{d\nu} v(F) \left( f^{-1} \circ F - \nabla \left( \frac{\tilde{F}^2}{2} \right) \right) \nu(F) \right).
\]
Next we follow the method of [13] to extend equation (5.32) for $F : [0, T] \times \Sigma \rightarrow \mathcal{M} \subset \mathbb{R}^n$ which do not necessarily map to $f(\mathcal{M})$. Let $\Psi_{\Omega_t}(F)$ be the projection onto the normal space of $\Omega_t = F(t, \Sigma)$. We notice that if $F$ is close enough in $C^1$ to a family of immersions that map to $f(\mathcal{M})$, then $\Psi_{\mathcal{M}} \circ F$ is also a family of immersions and $\nu(\Psi_{\mathcal{M}} \circ F)$ and $\nu(\Psi_{\Omega_t} \circ F)$ is defined. Thus we will deal with the following equation

$$\nabla_{\tau} F - \frac{d\mu_t}{d\mu} \tilde{v} \frac{\rho}{\text{vol}(F)} \tilde{v} - \Psi_{\Omega_t} D_A D_B \Psi_{\mathcal{M}}(F) \left( \partial_i F^A \partial_j F^B - \frac{d\mu_t}{d\mu} \tilde{v} g^{ij} \partial_i F^A \partial_j F^B \right) = \nabla_{\tau} \nu(\Psi_{\Omega_t} \circ F)
$$

(4.33)

where $\tilde{v} = \Psi_{\Omega_t} \nu(\Psi_{\mathcal{M}} \circ F)$ and $\nu(\Psi_{\Omega_t} \circ F)$ and $\tilde{\nu} = \Psi_{\Omega_t} \nu(\Psi_{\mathcal{M}} \circ F)$.

The following result shows that if $F$ maps to $f(\mathcal{M})$ initially and the initial velocity is tangent to $f(\mathcal{M})$, then $F$ maps to $f(\mathcal{M})$ for all time. The proof is the same with Lemma 4.3 in [13], so we omit it.

**Lemma 4.5.** Assume that equation (4.33) with initial data $F(0, x) \in f(\mathcal{M})$ and $\partial_t F(0, x) \in T_{F(0, x)} f(\mathcal{M})$ has a smooth solution $F$ on $[0, T] \times \Sigma$. Then $F(t, x) \in f(\mathcal{M})$ and $f^{-1} \circ F$ solves equation (4.12) with initial data $f^{-1} \circ F(0)$ and $D f^{-1}(\partial_t F(0))$ on $[0, T] \times \Sigma$. In what follows, one can use the same process of dealing with the Euclidean case to prove the existence of solution for equation (4.33). Here we omit the proof process.

5. PROOF OF THEOREM 1.2

This section is to study the stability problem of (1.2) in $B_{R,T}^{\epsilon}$. For convenience, we only prove the Euclidean case, and the proof process of general case is the similar. Assume that there exist two solutions $\tilde{F}$ and $\hat{F}$ of (1.1) with corresponding to two different initial data $(\tilde{F}_0, \tilde{F}_1)$ and $(\hat{F}_0, \hat{F}_1)$. Let $\hat{F} = \tilde{F} - \hat{F}$. Then we have

$$\partial_t \hat{F} = \epsilon^{n-1} \frac{d\mu_t}{d\mu} (\tilde{F}_0 - \hat{F}_0) \left( -H(\hat{F}) + \epsilon \phi(\hat{F}) \hat{F} - \epsilon^2 \phi(\hat{F}) \nabla(\frac{\hat{F}^2}{2}) + \frac{\rho}{\text{vol}(\hat{F})} \right) \nu(\hat{F})$$

$$+ \epsilon^{n-1} \frac{d\mu_t}{d\mu} \left( \nu(\hat{F}) - \nu(\tilde{F}) \right) \left( -H(\hat{F}) + \epsilon \phi(\hat{F}) \hat{F} - \epsilon^2 \phi(\hat{F}) \nabla(\frac{\hat{F}^2}{2}) + \frac{\rho}{\text{vol}(\hat{F})} \right) \nu(\hat{F})$$

$$+ \epsilon^{n-1} \frac{d\mu_t}{d\mu} \nu(\hat{F}) \left( -H(\hat{F}) + \epsilon \phi(\hat{F}) \hat{F} - \epsilon^2 \phi(\hat{F}) \nabla(\frac{\hat{F}^2}{2}) + \frac{\rho}{\text{vol}(\hat{F})} \right) \nu(\hat{F})$$

(5.1)

with initial data

$$F_0 = \tilde{F}_0 - \hat{F}_0, \quad F_1 = \tilde{F}_1 - \hat{F}_1.
$$

Introduce an auxiliary function

$$F^* = F - F_0 - t F_1,
$$

(5.3)
then the initial value problem (5.1) - (5.2) is equivalent to a zero initial value problem. For convenience, we denote the right hand side of (5.1) by \( N(F, \bar{F}, \hat{F}) \). Then equation (5.1) can be rewritten as

\[
\partial_t F^* - N(F^*, \bar{F}, \hat{F}) = 0.
\]

We consider the approximation system of (5.4) as

\[
\mathcal{G}'(F^*) := \partial_t F^* - \Pi_{N_i} N(0, \bar{F}, \hat{F}).
\]

Then using the similar computation process with (4.16), we have

\[
\mathcal{L}_c(F^*) + E'(t, x) + R(F^*) - E'(t, x) = 0,
\]

where \( E'(t, x) \) is a function which does not depends on \( F^* \),

\[
\mathcal{L}_c(F^*) = \partial_t F^* - \Pi_{N_i} \partial_{F^*} N(0, \bar{F}, \hat{F}) F^*,
\]

\[
R(F^*) = \varepsilon^{n-1} \Pi_{N_i} (N(F^*, \bar{F}, \hat{F}) - N(F, \bar{F}, \hat{F}) - \partial_{F^*} N(0, \bar{F}, \hat{F}) F^*).
\]

Direct computation shows that \( \mathcal{L}_c(F^*) \) is a weak hyperbolic system, which has the same structure as (3.1) - (3.2). So by Proposition 3.2, there exists a solution \( F^* \) of

\[
\mathcal{L}_c(F^*) + E'(t, x) = 0,
\]

\[
F_0^* = 0, \quad \partial_t F_1^* = 0.
\]

A similar estimate with (4.14) is derived as

\[
|||F^*|||_{s, T} \leq c_{36}|||E'|||_{s, T}.
\]

Since the lowest exponent of \( F^* \) in (5.7) is \( n + 1 \), so we have the following result.

**Lemma 5.1.** Let \( \bar{F}, \hat{F} \in \mathcal{B}_R^s \). For any \( s > \max \{2, \frac{4n}{n+1} \} \), there holds

\[
|||R(F^*)|||_{s, T} \leq c_{37}|||F^*|||_{s+2, T}^{n+1},
\]

where \( c_{37} \) depends on the constant \( R \).

Then by (5.6) and (5.8), we have

\[
|||F^*|||_{s, T} \leq c_{36}|||E'|||_{s, T} \leq c_{36}|||R(F^*)|||_{s, T} \\
\leq c_{38} \varepsilon^{n-1} N_1^{n+1}|||F^*|||_{s, T}^{n+1} \\
\leq c_{39} \varepsilon^{n-1} N_1^{n+1} N_1^{(n+1)^2} |||F^*|||_{s+1, T}^{(n+1)^2} \\
\leq \ldots \\
\leq c_{40}(8\varepsilon|||F^*|||_{s_0, T})^{(n+1)^i},
\]

which combines with (5.3), we have

\[
|||F|||_{s, T} \leq |||F_0|||_{s, T} + T|||F_1|||_{s, T} + c_{40}(8\varepsilon|||F^*|||_{s_0, T})^{(n+1)^i}.
\]

Thus we obtain

\[
|||\bar{F} - \hat{F}|||_{s, T} \leq |||\bar{F}_0 - \hat{F}_0|||_{s, T} + T|||\bar{F}_1 - \hat{F}_1|||_{s, T} + c_{40}(8\varepsilon|||F^*|||_{s_0, T})^{(n+1)^i},
\]

which implies the stability result for equation (1.2).

In particularly, if two solutions \( \bar{F} \) and \( \hat{F} \) of (1.1) has the same initial data, i.e. \( \bar{F}_0 = \hat{F}_0 \) and \( \bar{F}_1 = \hat{F}_1 \). Then we choose a suitable small \( \varepsilon \) such that

\[
0 < 8\varepsilon|||F^*|||_{s_0, T} < 1.
\]
Then we have
\[
\lim_{t \to \infty} ||\vec{F} - \tilde{F}||_{s_t, T} = 0,
\]
which gives the uniqueness of solution for equation (1.2) with the initial data \(F_0\) and \(F_1\). This completes the proof of Theorem 1.2.

Acknowledgments. This work was done in Beijing International Center for Mathematical Research. The author expresses his sincere thanks to Prof G. Tian for introducing him to the subject of hyperbolic mean curvature flows and his many kind suggestions and helps!
