Abstract. We consider systems of diffusion equations that have considerable interest in Soil Science and Mathematical Biology and focus upon the problem of finding those forms of this class that can be linearized. In particular we use the equivalence transformations of the second generation potential system to derive forms of this system that can be linearized. In turn, these transformations lead to nonlocal mappings that linearize the original system.

Key words: diffusion equations; equivalence transformations; linearization

2000 Mathematics Subject Classification: 35A30; 58J70; 58J72; 92B05

1 Introduction

Whilst systems of pure diffusion equations, in both their linear and nonlinear forms are well known and have many physical and biological applications, the research described here focusses on less familiar cases where diffusion coefficients or other ‘shape’ functions are defined either in general or poor analytic terms. Of particular interest here is the case of the extension of Richard’s equation, which describes the movement of water in a homogeneous unsaturated soil, to cases describing the combined transport of water vapour and heat under a combination of gradients of soil temperature and volumetric water content. Such coupled transport is of considerable significance in semi-arid environments where moisture transport often occurs essentially in the water vapour phase \cite{6}. Under these conditions the transport equations, valid in a vertical column of soil, may be written in the form \cite{6}

\[
\begin{align*}
\frac{\partial u}{\partial t} &= \frac{\partial}{\partial x} \left[ f(u, v) \frac{\partial u}{\partial x} + g(u, v) \frac{\partial v}{\partial x} \right], \\
\frac{\partial v}{\partial t} &= \frac{\partial}{\partial x} \left[ h(u, v) \frac{\partial u}{\partial x} + k(u, v) \frac{\partial v}{\partial x} \right],
\end{align*}
\]

(1)

where \(u(x, t)\) and \(v(x, t)\) are respectively the soil temperature and volumetric water content at depth \(x\) and time \(t\). It is important to realize that extensions which include the coupled diffusion of solute follow in an obvious way.

If we introduce the potential variable \(w\), we can generate the auxiliary system of \cite{11},

\[
\begin{align*}
w_x &= u, \\
w_t &= f(u, v)u_x + g(u, v)v_x, \\
v_t &= \left[ h(u, v)u_x + k(u, v)v_x \right]_x.
\end{align*}
\]

(2)
Introduce potential variables \( w \) and \( z \) we generate the second generation auxiliary system of (1),

\[
\begin{align*}
  w_x &= u, \\
  w_t &= f(u, v)u_x + g(u, v)v_x, \\
  z_x &= v, \\
  z_t &= h(u, v)u_x + k(u, v)v_x.
\end{align*}
\] (3)

The study of Lie symmetries of system (1) has been considered in [2, 10]. It is known that Lie symmetries of the auxiliary systems, in some cases, lead to non-local symmetries known as potential symmetries, for the original system. Lie symmetries for the systems (2) and (3) that induce potential symmetries for the original system (1) have been considered in [9].

Here we calculate the equivalence transformations for the systems (1)–(3). We use the equivalence transformations of (3) to derive those forms of (3) that can be linearized. Consequently these point transformations lead to contact transformations that linearize the corresponding forms of (1). Furthermore for one case of (2), which admits infinite-dimensional Lie symmetries, we construct a linearizing mapping.

## 2 Equivalence transformations

An equivalence transformation is a nondegenerate change of the independent and dependent variables taking a PDE into another PDE of the same form. For example, an equivalence transformation of the system (1) will transform it into a system of the same form, but in general, with different functions \( f(u, v), g(u, v), h(u, v) \) and \( k(u, v) \). The set of all equivalence transformations forms an equivalence group. We use the infinitesimal method [7] to determine the equivalence transformations of the systems (1)–(3).

### 2.1 Equivalence transformations for system (1)

We seek for equivalence group generators of the form

\[
X^E = \xi_1 \frac{\partial}{\partial x} + \xi_2 \frac{\partial}{\partial t} + \eta_1 \frac{\partial}{\partial u} + \eta_2 \frac{\partial}{\partial v} + \phi_1 \frac{\partial}{\partial f} + \phi_2 \frac{\partial}{\partial g} + \phi_3 \frac{\partial}{\partial h} + \phi_4 \frac{\partial}{\partial k}.
\]

We will present the results, without giving any detailed calculations. The method for determining equivalence transformations is presented in [7]. (See also in [5]). We find that the system (1) has a continuous group of equivalence transformations generated by the following 10 infinitesimal operators:

\[
\begin{align*}
  X_1^E &= \frac{\partial}{\partial x}, & X_2^E &= \frac{\partial}{\partial t}, & X_3^E &= \frac{\partial}{\partial u}, & X_4^E &= \frac{\partial}{\partial v}, \\
  X_5^E &= x \frac{\partial}{\partial x} + 2f \frac{\partial}{\partial f} + 2g \frac{\partial}{\partial g} + 2h \frac{\partial}{\partial h} + 2k \frac{\partial}{\partial k}, \\
  X_6^E &= t \frac{\partial}{\partial t} - f \frac{\partial}{\partial f} - g \frac{\partial}{\partial g} - h \frac{\partial}{\partial h} - k \frac{\partial}{\partial k}, & X_7^E &= u \frac{\partial}{\partial u} + g \frac{\partial}{\partial g}, \\
  X_8^E &= v \frac{\partial}{\partial v} - g \frac{\partial}{\partial g} + h \frac{\partial}{\partial h}, & X_9^E &= v \frac{\partial}{\partial u} + h \frac{\partial}{\partial h} + (k - f) \frac{\partial}{\partial g} - h \frac{\partial}{\partial k}, \\
  X_{10}^E &= u \frac{\partial}{\partial v} - g \frac{\partial}{\partial f} + (f - k) \frac{\partial}{\partial h} + g \frac{\partial}{\partial k}.
\end{align*}
\]

Using Lie’s theorem we show that the above equivalence transformations in finite form read

\[
\begin{align*}
  x' &= c_1 x + c_2, \\
  t' &= c_3 t + c_4, \\
  u' &= c_5 u + c_6 v + c_7, \\
  v' &= c_8 u + c_9 v + c_{10},
\end{align*}
\]
where

\[
\begin{align*}
    f' &= \frac{c_2^2}{c_3} [c_5 (c_6 f - c_8 g) + c_0 (c_9 h - c_8 k)], \\
    g' &= \frac{c_2^2}{c_3} [-c_5 (c_6 f - c_8 g) - c_6 (c_9 h - c_8 k)], \\
    h' &= \frac{c_2^2}{c_3} [c_8 (c_6 f - c_8 g) + c_9 (c_9 h - c_8 k)], \\
    k' &= \frac{c_2^2}{c_3} [-c_8 (c_6 f - c_8 g) - c_9 (c_9 h - c_8 k)],
\end{align*}
\]

Clearly, if the functions \( f, g, h, k \) are linearly dependent, then one of the functions of the transformed equation can be taken equal to zero, provided that the constants involved satisfy certain relations. That is, system \( (1) \) can be mapped into a system of the same form but with one of the functions to be zero. For example, if \( f = g = h = k \) then the mapping \( x \mapsto x, t \mapsto t, u \mapsto u + v, v \mapsto u + cv, c \neq 1 \) transforms the system \( (1) \) into a system of the same form, but with \( g = 0 \).

### 2.2 Equivalence transformations for system \( (2) \)

We find that the system \( (2) \) has a continuous group of equivalence transformations generated by the following 9 infinitesimal operators:

\[
\begin{align*}
    Y_1^E &= \frac{\partial}{\partial x}, & Y_2^E &= \frac{\partial}{\partial t}, & Y_3^E &= \frac{\partial}{\partial u} + v \frac{\partial}{\partial w}, & Y_4^E &= \frac{\partial}{\partial v}, & Y_5^E &= \frac{\partial}{\partial h}, \\
    Y_6^E &= u \frac{\partial}{\partial u} + v \frac{\partial}{\partial v} + w \frac{\partial}{\partial w}, & Y_7^E &= f \frac{\partial}{\partial f} + 2g \frac{\partial}{\partial g} + 2h \frac{\partial}{\partial h} + 2k \frac{\partial}{\partial k}, \\
    Y_8^E &= t \frac{\partial}{\partial t} - f \frac{\partial}{\partial f} - g \frac{\partial}{\partial g} - h \frac{\partial}{\partial h} - k \frac{\partial}{\partial k}, & Y_9^E &= v \frac{\partial}{\partial v} - g \frac{\partial}{\partial g} + h \frac{\partial}{\partial h}.
\end{align*}
\]

The equivalence transformations, in finite form, read

\[
\begin{align*}
    x' &= c_1 x + c_2, & t' &= c_3 t + c_4, & u' &= c_5 u + c_6, & v' &= c_7 v + c_8, \\
    w' &= c_1 c_5 w + c_1 c_6 x + c_9,
\end{align*}
\]

where

\[
\begin{align*}
    f' &= \frac{c_2^2 f}{c_3}, & g' &= \frac{c_5 c_2^2 g}{c_7 c_3}, & h' &= \frac{c_7 c_2^2 h}{c_5 c_3}, & k' &= \frac{c_2^2 k}{c_3}.
\end{align*}
\]

### 2.3 Equivalence transformations for system \( (3) \)

We find that the system \( (3) \) has a continuous group of equivalence transformations generated by the following 14 infinitesimal operators:

\[
\begin{align*}
    Z_1^E &= \frac{\partial}{\partial x}, & Z_2^E &= \frac{\partial}{\partial t}, & Z_3^E &= \frac{\partial}{\partial w}, & Z_4^E &= \frac{\partial}{\partial z}, \\
    Z_5^E &= z \frac{\partial}{\partial x} - u w \frac{\partial}{\partial u} - v^2 \frac{\partial}{\partial v} + (2vf - uh) \frac{\partial}{\partial f} \\
    &\quad + (-uk + 3vg + uf) \frac{\partial}{\partial h} + vh \frac{\partial}{\partial k}, \\
    Z_6^E &= w \frac{\partial}{\partial x} - u^2 \frac{\partial}{\partial u} - uv \frac{\partial}{\partial v} + (vg + 2uf) \frac{\partial}{\partial f} \\
    &\quad + ug \frac{\partial}{\partial g} + (vk + 3uh - vf) \frac{\partial}{\partial h} + (2uk - vg) \frac{\partial}{\partial k}, \\
    Z_7^E &= x \frac{\partial}{\partial x} - u \frac{\partial}{\partial u} - v \frac{\partial}{\partial v} + (2f \frac{\partial}{\partial f} + 2g \frac{\partial}{\partial g} + 2h \frac{\partial}{\partial h} + 2k \frac{\partial}{\partial k}.
\end{align*}
\]
\[ Z^E_8 = t \frac{\partial}{\partial t} - f \frac{\partial}{\partial f} - g \frac{\partial}{\partial g} - h \frac{\partial}{\partial h} - k \frac{\partial}{\partial k}, \]
\[ Z^E_9 = v \frac{\partial}{\partial u} + z \frac{\partial}{\partial w} + h \frac{\partial}{\partial f} + (k - f) \frac{\partial}{\partial g} - h \frac{\partial}{\partial k}, \]
\[ Z^E_{10} = u \frac{\partial}{\partial v} + w \frac{\partial}{\partial z} - g \frac{\partial}{\partial f} + (f - k) \frac{\partial}{\partial h} + g \frac{\partial}{\partial k}, \]
\[ Z^E_11 = v \frac{\partial}{\partial v} + z \frac{\partial}{\partial z} - g \frac{\partial}{\partial g} + h \frac{\partial}{\partial h}, \]
\[ Z^E_{12} = u \frac{\partial}{\partial u} + w \frac{\partial}{\partial w} + g \frac{\partial}{\partial g} - h \frac{\partial}{\partial h}, \]
\[ Z^E_{13} = \frac{\partial}{\partial v} + x \frac{\partial}{\partial z}, \]
\[ Z^E_{14} = \frac{\partial}{\partial u} + x \frac{\partial}{\partial w}. \]

Naturally using Lie's theorem we can find the equivalence transformations in finite form. We find that
\[ x' = ax + p_1 w + p_2 z + c_1, \quad t' = \frac{1}{\gamma} t + \delta, \quad w' = q_1 x + a_1 w + a_2 z + c_2, \]
\[ z' = q_2 x + a_3 w + a_4 z + c_3. \]
However the forms of \( u' \) and \( v' \) cannot be found easily from Lie's theorem. In the next section we show that they take the form
\[ u' = \frac{q_1 + a_1 u + a_2 v}{a + p_1 u + p_2 v}, \quad v' = \frac{q_2 + a_3 u + a_4 v}{a + p_1 u + p_2 v}. \]
Furthermore we state that the forms of \( f' \), \( g' \), \( h' \) and \( k' \), which are all linear in \( f \), \( g \), \( h \) and \( k \), are very lengthy.

In the following section we use the finite form of the equivalence transformations to derive special cases of the system (3) that can be linearized. In turn these transformations lead to nonlocal mappings that linearize the corresponding forms (1).

3 On linearization

Here we consider the problem of finding forms of the nonlinear system (3) that can be linearized. We adopt the idea of the transformation
\[ x' = v, \quad t' = t, \quad u' = \frac{1}{u}, \quad v' = x \]
that maps the auxiliary system of the nonlinear diffusion equation \( u_t = [u^{-2} u_x]_x \)
\[ v_x = u, \quad v_t = u^{-2} u_x \]
into the auxiliary system of the linear diffusion equation \( u'_{t'} = u'_{x' x'}, \)
\[ v'_{x'} = u', \quad v'_{t'} = u'_{x'}. \]
The above transformation is a member of the equivalence transformations of
\[ v_x = u, \quad v_t = f(u) u_x. \]
Motivated by the above results we find the forms of \( f(u, v), g(u, v), h(u, v) \) and \( k(u, v) \) such that system (4) can be mapped into a linear system by the equivalence transformations admitted by (3). These local mappings will lead to nonlocal mappings that linearize the corresponding forms of the system (1).

We consider system (1) with the four functions equal to constants. That is, it takes the linear form
\[ u'_{t'} = \mu_1 u'_{x' x'} + \mu_2 v'_{x' x'}, \quad v'_{t'} = \mu_3 u'_{x' x'} + \mu_4 v'_{x' x'}. \]
We introduce the potential variables $w'$ and $z'$ to obtain the auxiliary system of \[ w'_x = u', \quad w'_t = \mu_1 u'_x + \mu_2 v'_x, \quad z'_x = v', \quad z'_t = \mu_3 u'_x + \mu_4 v'_x. \] (6)

From the equivalence transformations of the system (3) we deduce the finite transformations
\[
\begin{align*}
x' &= ax + p_1 w + p_2 z, \\
w' &= q_1 x + a_1 w + a_2 z, \\
z' &= q_2 x + a_3 w + a_4 z
\end{align*}
\] (7)
where we have taken, without loss of generality, the translation constants equal to zero. Clearly, the inverse transformations is of the form
\[
\begin{align*}
x &= bx' + r_1 w' + r_2 z', \\
w &= s_1 x' + b_1 w' + b_2 z', \\
z &= s_2 x' + b_3 w' + b_4 z'.
\end{align*}
\] (8)

Also from the equivalence transformations we deduce that
\[ t' = \gamma t, \]
with the translation constant taken to be zero.

Introducing vector notation, we can write systems (3) and (6) in the form
\[
\begin{align*}
w_x &= u, \\
w_t &= F(u)u_x
\end{align*}
\] (9)
and
\[
\begin{align*}
w'_x &= u', \\
w'_t &= \Lambda u'_x
\end{align*}
\] (10)
respectively, where
\[
\begin{align*}
w &= \begin{bmatrix} w \\ z \end{bmatrix}, \\
u &= \begin{bmatrix} u \\ v \end{bmatrix}, \\
F(u) &= \begin{bmatrix} f(u,v) & g(u,v) \\ h(u,v) & k(u,v) \end{bmatrix}, \\
\Lambda &= \begin{bmatrix} \mu_1 & \mu_2 \\ \mu_3 & \mu_4 \end{bmatrix}.
\end{align*}
\]

Furthermore transformation (7) can be written in the form
\[
\begin{bmatrix} x' \\ w' \end{bmatrix} = \begin{bmatrix} a & p^T \\ q & A \end{bmatrix} \begin{bmatrix} x \\ w \end{bmatrix},
\] (11)
where
\[
\begin{bmatrix} p_1 \\ p_2 \end{bmatrix}, \quad \begin{bmatrix} q_1 \\ q_2 \end{bmatrix}, \quad \begin{bmatrix} a_1 & a_2 \\ a_3 & a_4 \end{bmatrix}
\]
and the inverse transformation (8) takes the form
\[
\begin{bmatrix} x \\ w \end{bmatrix} = \begin{bmatrix} b & r^T \\ s & B \end{bmatrix} \begin{bmatrix} x' \\ w' \end{bmatrix},
\] (12)
where
\[
\begin{bmatrix} r_1 \\ r_2 \end{bmatrix}, \quad \begin{bmatrix} s_1 \\ s_2 \end{bmatrix}, \quad \begin{bmatrix} b_1 & b_2 \\ b_3 & b_4 \end{bmatrix}
\]
Therefore from the transformations (11) and (12) we deduce that
\[
\begin{bmatrix} a & p^T \\ q & A \end{bmatrix} \begin{bmatrix} b & r^T \\ s & B \end{bmatrix} = \begin{bmatrix} ab + p \cdot s & ar^T + p^TB \\ qb + As & qr^T + AB \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & \mathbf{I}_2 \end{bmatrix}.
\] (13)
where \( I_2 \) is the \( 2 \times 2 \) identity matrix. In addition:

\[
\begin{bmatrix}
    b & r^T \\
    s & B
\end{bmatrix}
\begin{bmatrix}
    a & p^T \\
    q & A
\end{bmatrix}
= \begin{bmatrix}
    ab + r \cdot q & b p^T + r^T A \\
    sa + B q & sp^T + BA
\end{bmatrix}
= \begin{bmatrix}
    1 & 0 \\
    0 & I_2
\end{bmatrix}.
\] (14)

Using normal transformation rules:

\[
w_x = w_x' \frac{\partial x'}{\partial x} + w_t' \frac{\partial t'}{\partial x}
\]

and from the transformations (11) and (12) becomes

\[
w_x = (s + Bw_x') (a + p \cdot w_x).
\]

Thus from the two potential systems (9) and (10)

\[
u = (s + Bu') (a + p \cdot u).
\]

Finally, from the relations (13) and (14) we obtain

\[
u' = \frac{Au + q}{a + p \cdot u}.
\]

Hence,

\[
u' = \frac{q_1 + a_1 u + a_2 v}{a + p_1 u + p_2 v}, \quad v' = \frac{q_2 + a_3 u + a_4 v}{a + p_1 u + p_2 v}.
\]

These forms of \( u' \) and \( v' \) can also be obtained from the equivalence transformations, however, in a more complicated manner.

Consider now

\[
w_{x'} = w_{x'} \frac{\partial x}{\partial t'} + w_{t'} \frac{\partial t}{\partial t'}
\]

and from the transformations (11) and (12) and the two potential systems (9) and (10) we find

\[
\Lambda u_{x'} = (q + Au)(r^T \Lambda u_{x'}) + \gamma AF u_x.
\] (15)

Multiply by \( r^T \) and using the relations (13) and (14) it follows that

\[
r^T \Lambda u_{x'} = -\frac{\gamma p^T F u_x}{a + p \cdot u}
\]

and also consider

\[
u_{x'} = u_{x'} \frac{\partial x}{\partial x'} + u_{t'} \frac{\partial t}{\partial x'}
\]

which gives

\[
u_{x'} = (b + r^T u') u_x
\]

and using the above form of \( u' \) and the relations (14) reduces to

\[
u_{x'} = \frac{u_x'}{a + p \cdot u}.
\]
These expressions simplify \((16)\) to
\[
\Lambda u''_x = -\gamma(q + Au)(p^T Fu_x) + \gamma(a + p \cdot u)AFu_x.
\]
Using the relations \((13)\) and \((14)\) and differentiate the expression of \(u'\) with respect to \(x\) the above equation takes the form
\[
\Lambda [(a + p^T u)Au_x - (p \cdot u_x)Au - pu_xq] = -\gamma(q + Au)(p^T Fu_x) + \gamma(a + p \cdot u)AFu_x
\]
and simplifying to get
\[
\Lambda [(a + p^T u)A - (Au + q)p^T] = \gamma(a + p^T u)^2 [(a + p^T u)A - (Au + q)p^T] F.
\]
Solving for \(F(u)\) to obtain
\[
F(u) = \frac{[H(u)]^{-1} \Lambda H(u)}{\gamma(a + p^T u)^2},
\]
where
\[
H(u) = (a + p^T u)A - (Au + q)p^T.
\]

Summarizing we have:

**Theorem 1.** The nonlinear system of diffusion equations \((9)\) can be mapped into the linear system \((10)\) by the equivalence transformation admitted by \((9)\) if and only if the functions \(F(u)\) is of the form \((16)\).

**Remark 1.** Point transformations that linearize system \((3)\) lead to contact transformations that linearize system \((1)\).

**Remark 2.** In the case where \(\Lambda = I_2\), that is, system \((5)\) becomes two separate linear diffusion equations with diffusivity constants equal to 1, the linearizing form of \((16)\) is
\[
\begin{align*}
    u_l &= \left[\frac{u_x}{(p_1 u + p_2 v + a)^2}\right]_x, \\
    v_l &= \left[\frac{v_x}{(p_1 u + p_2 v + a)^2}\right]_x.
\end{align*}
\]

It is known that the part of transformation \((16)\), namely \(x' = v, t' = t, v' = x\), which is known as pure hodograph transformation maps the potential equation \(v_t = v_x^2v_{xx}\) into the linear heat equation \(v'_{t'} = v'_{xx}\). In the spirit of the work in \((1)\), where such transformations were classified for the potential equation \(v_t = f(v_x)v_{xx}\), we consider the potential system of \((1)\),
\[
\begin{align*}
    w_t &= f(w_x, z_x)w_{xx} + g(w_x, z_x)z_{xx}, \\
    z_t &= h(w_x, z_x)w_{xx} + k(w_x, z_x)z_{xx}.
\end{align*}
\]

Transformations that presented in this section which linearize systems of the form \((8)\), can also be employed to linearize systems of the form \((18)\). We present the results in the following theorem:

**Theorem 2.** The nonlinear system of potential diffusion equations \((18)\) can be mapped into the linear system
\[
\begin{align*}
    w'_{t'} &= \mu_1 w'_{x'x'} + \mu_2 z'_{x'x'}, \\
    z'_{t'} &= \mu_3 w'_{x'x'} + \mu_4 z'_{x'x'}
\end{align*}
\]
by the transformation \((16)\) if and only if the functions \(f(w_x, z_x), g(w_x, z_x), h(w_x, z_x), k(w_x, z_x)\) are of the form
\[
\begin{bmatrix}
    f(w_x, z_x) & g(w_x, z_x) \\
    h(w_x, z_x) & k(w_x, z_x)
\end{bmatrix} = \frac{[H(w_x)]^{-1} \Lambda H(w_x)}{\gamma(a + p^T w_x)^2},
\]
where
\[
H(w_x) = (a + p^T w_x)A - (Aw_x + q)p^T.
\]
Using the above theorem the corresponding form of Remark 2 reads:

**Remark 3.** The nonlinear potential system

\[
\begin{align*}
  w_t &= \frac{w_{xx}}{(p_1 w_x + p_2 z_x + \alpha)^2}, &
  z_t &= \frac{z_{xx}}{(p_1 w_x + p_2 z_x + \alpha)^2},
\end{align*}
\]

can be transformed into two separable linear heat equations.

## 4 Examples of linearizing mappings

In this section we use the results of the previous section to present two examples.

**Example 1.** We consider the system (17) with its corresponding second generating potential system

\[
\begin{align*}
  w_x &= u, &
  w_t &= \frac{u_x}{(p_1 u + p_2 v + a)^2}, \\
  z_x &= v, &
  z_t &= \frac{v_x}{(p_1 u + p_2 v + a)^2}.
\end{align*}
\]

(19)

We have shown that system (19) can be linearized using the equivalence transformations of (5).

That is, the transformation

\[
\begin{align*}
  x' &= ax + p_1 w + p_2 z, &
  t' &= t, &
  u' &= q_1 + a_1 u + a_2 v, &
  z' &= q_2 x + a_3 w + a_4 z,
\end{align*}
\]

maps the linear system

\[
\begin{align*}
  w'_{xx} &= u', &
  w'_{xt} &= u'_{xx}, &
  z'_{xx} &= v', &
  z'_{xt} &= v'_{xx},
\end{align*}
\]

into the nonlinear system (19).

This transformation leads to the contact transformation

\[
\begin{align*}
  dx' &= ax + (u + v)dz + \left[(p_1 u + p_2 v + a)^{-2}(u_x + v_x)\right] dt, &
  dt' &= dt, \\
  u' &= \frac{q_1 + a_1 u + a_2 v}{a + p_1 u + p_2 v}, &
  v' &= \frac{q_2 + a_3 u + a_4 v}{a + p_1 u + p_2 v}
\end{align*}
\]

that maps the two separate linear diffusion equations

\[
\begin{align*}
  u'_{tt} &= u'_{xx}, &
  v'_{tt} &= v'_{xx},
\end{align*}
\]

into the nonlinear system (17). Using Theorem 2 we deduce that the potential form of (17),

\[
\begin{align*}
  w_t &= \frac{w_{xx}}{(p_1 w_x + p_2 z_x + \alpha)^2}, &
  z_t &= \frac{z_{xx}}{(p_1 w_x + p_2 z_x + \alpha)^2},
\end{align*}
\]

can be linearized by the transformation

\[
\begin{align*}
  x' &= ax + p_1 w + p_2 z, &
  t' &= t, &
  u' &= q_1 + a_1 u + a_2 v, &
  z' &= q_2 x + a_3 w + a_4 z.
\end{align*}
\]

**Example 2.** We consider the special case of the equivalence transformation of (3)

\[
\begin{align*}
  x' &= w + z, &
  t' &= 2t, &
  u' &= \frac{v + 1}{u + v}, &
  v' &= \frac{u + 1}{u + v}, &
  w' &= x + z, &
  z' &= x + w.
\end{align*}
\]
which maps the linear system
\[ w'_{x'} = u', \quad w'_t = \mu_1 u'_{x'} + \mu_2 v'_{x'}, \quad z'_{x'} = v', \quad z'_t = \mu_3 u'_{x'} + \mu_4 v'_{x'}, \]
into the nonlinear system
\[ w_x = u, \quad w_t = \frac{\nu_1 uv + \nu_2 u + \nu_3 v + \nu_4}{(u + v)^3} u_x + \frac{-\nu_1 u^2 + (\nu_2 - \nu_3)u + \nu_4}{(u + v)^3} v_x, \]
\[ z_x = v, \quad z_t = \frac{\nu_1 v^2 + (\nu_2 - \nu_3) v - \nu_4}{(u + v)^3} u_x + \frac{-\nu_1 uv + \nu_3 u + \nu_2 v - \nu_4}{(u + v)^3} v_x, \]
where
\[ \nu_1 = \mu_1 - \mu_2 + \mu_3 - \mu_4, \quad \nu_2 = \mu_1 + \mu_2 + \mu_3 + \mu_4, \quad \nu_3 = \mu_1 - \mu_2 - \mu_3 + \mu_4. \]

Clearly if we set \( \mu_1 = \mu_4 = 1, \mu_2 = \mu_3 = 0 \), we obtain a special case of the previous example.

Now the above transformation lead to the contact transformation
\[
\begin{align*}
\text{d}x' &= (u + v)\text{d}x + \left[\nu_1 (vu_x - uv_x) + \nu_2 (u_x + v_x)\right] (u + v)^{-2} \text{d}t, \\
u' &= \frac{1 + v}{u + v}, \quad v' = \frac{1 + u}{u + v}
\end{align*}
\]
that maps the linear system
\[ u'_{x'} = \mu_1 u'_{x'x'}, \quad v'_{x'} = \mu_3 u'_{x'x'} + \mu_4 v'_{x'x'} \]
into the nonlinear system
\[ u_t = \left[ \frac{\nu_1 uv + \nu_2 u + \nu_3 v + \nu_4}{(u + v)^3} u_x + \frac{-\nu_1 u^2 + (\nu_2 - \nu_3)u + \nu_4}{(u + v)^3} v_x \right] + \left[ \frac{\nu_1 v^2 + (\nu_2 - \nu_3) v - \nu_4}{(u + v)^3} u_x + \frac{-\nu_1 uv + \nu_3 u + \nu_2 v - \nu_4}{(u + v)^3} v_x \right], \\
v_t = \left[ \frac{\nu_1 v^2 + (\nu_2 - \nu_3) v - \nu_4}{(u + v)^3} u_x + \frac{-\nu_1 uv + \nu_3 u + \nu_2 v - \nu_4}{(u + v)^3} v_x \right] + \left[ \frac{\nu_1 uv + \nu_2 u + \nu_3 v + \nu_4}{(u + v)^3} u_x + \frac{-\nu_1 u^2 + (\nu_2 - \nu_3)u + \nu_4}{(u + v)^3} v_x \right]. \]

5 A linearizing case of the system (2)

In Section 3 we used the equivalence transformations of (4) to derive linearizing mappings. We point out that employment of the equivalence transformations of (2) does not lead to linearizing mappings. However such linearizing mapping, which is not member of the equivalence transformations, exists for a special case of (2).

We consider the special case of (2)
\[ w_x = u, \quad w_t = -u^{-2} u_x, \quad v_t = \left[u^{-2} v_x\right]_x \] (20)
which is the first generation potential system of
\[ u_t = -\left[u^{-2} u_x\right]_x, \quad v_t = \left[u^{-2} v_x\right]_x. \] (21)
System (20) admits the infinite-dimensional Lie symmetries
\[ \Gamma_\phi = \phi(t, u) \frac{\partial}{\partial x} - u^2 \phi_u \frac{\partial}{\partial u}, \quad \Gamma_\psi = \psi(t, u) \frac{\partial}{\partial v}, \]
where the function $\phi(t, w)$ satisfies the backward linear heat equation $\phi_t + \phi_{ww} = 0$ and $\psi(t, w)$ satisfies the linear heat equation $\psi_t - \psi_{ww} = 0$. These symmetries induce potential symmetries for the system (24).

If a nonlinear PDE (or a system of PDEs) admits infinite-parameter groups, then it can be transformed into a linear PDE (or into a linear system of PDEs) if these groups satisfy certain criteria. These criteria and the method for finding the linearizing mapping using the infinite-dimensional symmetries can be found in [3]. Hence, using the method described in [3], the above infinite-dimensional Lie symmetries of (20) lead to the transformation

$$x' = w, \quad t' = t, \quad u' = \frac{1}{u}, \quad v' = v, \quad w' = x$$

which maps the linear system

$$w'_{x'} = u', \quad w'_t = -u'_{x'}, \quad v'_t = v'_{x'}$$

into the nonlinear system (20). Consequently this mapping lead to the contact transformation

$$dx' = udx + u^{-2}u_xdt, \quad dt' = dt, \quad u' = \frac{1}{u}, \quad v' = v$$

which maps the linear separable system

$$u'_{t'} = -u'_{x'x'}, \quad v'_{t'} = v'_{x'x'}$$

into the nonlinear system (21).

We point out that the above result cannot be achieved using the equivalence transformations of (3). However it is straightforward to derive the above contact transformation as a special case of the one derived in the Example 1, Section 4, which maps the two linear separable diffusion equations $u'_{t'} = u'_{x'x'}$ and $v'_{t'} = v'_{x'x'}$ into the nonlinear system $u_t = [u^{-2}u_x]_x$ and $v_t = [u^{-2}v_x]_x$.

6 Conclusion

In this paper we have considered the problem of finding forms of the general class of systems of diffusion equations (1) that can be linearized. We have employed the second generation potential system (3) and derived the equivalence transformations admitted by this system. Using these transformations we classified special cases of (3) that can be linearized. In turn these transformations lead to nonlocal mappings that linearize the corresponding forms of (1). Furthermore we determined a special case of (1) that can be linearized, by considering the Lie symmetries of the first generation potential system (2), which induce potential symmetries for the system (1).

The question that arises here is: Are these the only cases of the system (1) that can be linearized? Furthermore: Can the results obtained here be generalized for systems of $n$ equations? These are two of the problems of our investigation in the near future.
