BORDISM BETWEEN DOLD AND MILNOR
MANIFOLDS

ASHISH KUMAR DAS

Abstract. It is well known that Dold and Milnor manifolds give generators for the unoriented bordism algebra \( \mathcal{N} \) over \( \mathbb{Z}_2 \). The purpose of this paper is to determine those Milnor manifolds which represent the same bordism classes in \( \mathcal{N} \) as their Dold counterparts.

1. Introduction

Dold manifolds were first introduced by Dold [2]. A Dold manifold \( P(m, n) \) of dimension \( m + 2n \) is the quotient \( (S^m \times CP^n)/\sim \), where \( \sim \) is an equivalence relation given by \( (x, [z]) \sim (-x, \bar{z}) \). The ring structure of \( H^*(P(m, n); \mathbb{Z}_2) \) is described as

\[
H^*(P(m, n); \mathbb{Z}_2) = \left[ \frac{\mathbb{Z}_2[c]}{c^{m+1} = 0} \right] \otimes \left[ \frac{\mathbb{Z}_2[d]}{d^{n+1} = 0} \right],
\]

and the total Stiefel-Whitney class of \( P(m, n) \) is given by

\[
W(P(m, n)) = (1 + c)^m(1 + c + d)^n + 1,
\]

where \( c \) is the nonzero element of \( H^1(P(m, n); \mathbb{Z}_2) \cong \mathbb{Z}_2 \) and \( d \) is a suitable nonzero element of \( H^1(P(m, n); \mathbb{Z}_2) \cong \mathbb{Z}_2 \oplus \mathbb{Z}_2 \).

On the other hand Milnor manifolds were first introduced by Milnor [5]. A Milnor manifold \( H(m, n) \) is the \( m + n - 1 \) dimensional submanifold of \( \mathbb{R}P^m \times \mathbb{R}P^n \) given by

\[
H(m, n) = \{([x_0, \ldots, x_m], [y_0, \ldots, y_n]) \in \mathbb{R}P^m \times \mathbb{R}P^n : \sum_{i=0}^{\min(m,n)} x_iy_i = 0 \}.
\]

In fact \( H(m, n) \) is the submanifold of \( \mathbb{R}P^m \times \mathbb{R}P^n \) dual to \((a+b); a \) and \( b \) being the generators of \( H^*(\mathbb{R}P^m; \mathbb{Z}_2) \) and \( H^*(\mathbb{R}P^n; \mathbb{Z}_2) \) respectively. Note that \( a^{m+1} = b^{n+1} = 0 \), whereas \( a^i \) and \( b^j \) are non-zero for \( 0 \leq i \leq m \) and \( 0 \leq j \leq n \). The total Stiefel-Whitney class \( W(H(m, n)) \) of \( H(m, n) \) is given by the restriction to \( H(m, n) \) of the expression

\begin{flushright}
1991 Mathematics Subject Classification. 55N22, 57R75.
Key words and phrases. Bordism, Stiefel-Whitney Class.
\end{flushright}
and the Stiefel-Whitney number of $H(m, n)$ corresponding to a partition $i_1 + i_2 + \cdots + i_k = m + n - 1$ is given by

$$< (a + b) W_{i_1} \cdots W_{i_k}, [\mathbb{R}P^m \times \mathbb{R}P^n] > \in \mathbb{Z}_2$$

where $W_{i_j}$ is the sum of $i_j$-dimensional terms in the expansion of the expression (1.1). Thus the partition $i_1 + i_2 + \cdots + i_k = m + n - 1$ corresponds to a non-zero Stiefel-whitney number of $H(m, n)$ if and only if $W_{i_1} W_{i_2} \cdots W_{i_k} = a^m b^{n-1}$ or $a^{m-1} b^n$. Since $H(m, n) \cong H(n, m)$, we always assume that $m \leq n$. Further, throughout this paper the symbol $()$ will stand for binomial coefficient reduced modulo 2.

It is well known (see [2],[5]) that Dold as well as Milnor manifolds independently give generators for the unoriented bordism algebra $\mathcal{N}_*$ over $\mathbb{Z}_2$. Thus, in principle, every Milnor manifold is bordant to a union of products of Dold manifolds. In this paper we investigate the question “which Milnor manifolds are bordant to Dold manifolds?” and obtain definite answers in most of the cases.

## 2. Milnor manifolds which are bordant to Dold manifolds

We begin with the following trivial remark

**Remark 2.1.** $H(0, n) \cong \mathbb{R}P^{n-1} \cong P(n-1, 0) \forall n \geq 1$.

For non-trivial situations we have

**Proposition 2.2.** $H(2^\alpha - 2, n)$ is bordant to $P(n - 2^\alpha + 1, 2^\alpha - 2) \forall \alpha \geq 1$ and $\forall n \geq 2^\alpha - 1$.

**Proof.** The total Stiefel-Whitney class of $P(n - 2^\alpha + 1, 2^\alpha - 2)$ is given by

$$W(P) = (1 + c)^{n-2^\alpha+1}(1 + c + d)^{2^\alpha-1},$$

where $c^{n-2^\alpha+2} = 0 = d^{2^\alpha-1}$.

On the other hand the total Stiefel-Whitney class of $H(2^\alpha - 2, n)$ is given by
Consider a polynomial

$$W(x, y) = (1 + x)^{n-2} (1 + x + y)^{2n-1} \in \mathbb{Z}_2[x, y]$$

where \((x, y)\) satisfies the following conditions:

$$\dim x = 1, \quad \dim y = 2, \quad \text{and} \quad y^{2n-1} = 0. \quad (2.3)$$

Then,

$$W(P) = W(c, d) \quad \text{and} \quad W(H) = W(b, a(a + b)).$$

Clearly, both \((c, d)\) and \((b, a(a + b))\) satisfy the conditions in (2.3). Let \(W_i(x, y)\) be the sum of \(i\)-dimensional terms in \(W(x, y)\), where \(i > 0\).

Then

$$W_i(x, y) = D_{0,i} x^i + D_{1,i} x^{i-2} y + \cdots + D_{2^n-2,i} x^{2n-2} y^{2n-2}$$

where \(D_{j,i} \in \mathbb{Z}_2, \quad 0 \leq j \leq 2^{n-2} - 2\), \quad and \quad \(D_{j,i} = 0\) \quad if \quad \(i < 2j\). Let \(\omega \equiv i_1 + i_2 + \cdots + i_k = n + 2^n - 3\) be a partition of \(n + 2^n - 3\). Then,

$$W_\omega(x, y) = W_{i_1}(x, y) \cdots W_{i_k}(x, y) = \sum_{t=0}^{2^n-2} f_t(D) x^{n+2^n-3-2t} y^t$$

where

$$f_t(D) = \sum_{j_1 + \cdots + j_k = t} D_{j_1,i_1} D_{j_2,i_2} \cdots D_{j_k,i_k} \in \mathbb{Z}_2.$$

Therefore,

$$W_\omega(c, d) = f_{2^{n-2}}(D) c^{n-2n+1} d^{2^n-2}.$$

On the other hand

$$W_\omega(b, a(a + b)) = \sum_{t=0}^{2^n-2} f_t(D) b^{n+2^n-3-2t} a^t (a + b)^t.$$

Let \(X_t = b^{n+2^n-3-2t} a^t (a + b)^t\) \quad where \(0 \leq t \leq 2^n - 2\). \quad If \(t = 2^n - 2\), \quad then

$$X_t = b^{n+2^n-1} a^{2^n-2} (a + b)^{2^n-2} = a^{2^n-2} b^{n-2}. $$

If \(t \leq 2^{n-1} - 2\), \quad then \(n + 2^n - 3 - 2t \geq n + 2^n - 3 - (2^n - 4) = n + 1\), \quad and so \(X_t = 0\) \quad (since \(b^{n+1} = 0\)). \quad So, \(2^{n-1} - 1 \leq t < 2^n - 2\). \quad Then,
\[ X_t = \left( \frac{t}{2^\alpha - 2 - t} \right) a^{2^\alpha - 2} b^{n-1} + \left( \frac{t}{2^\alpha - 2 - t - 1} \right) a^{2^\alpha - 3} b^n \]

where \( A_t = 0 \) or \( 1 \); noting that

\[
\begin{align*}
\left( \frac{t}{2^\alpha - 2 - t} \right) + \left( \frac{t}{2^\alpha - 2 - t - 1} \right) &= 0 \in \mathbb{Z}_2.
\end{align*}
\]

Therefore,

\[
W_\omega(b,a(a+b)) = f_{2^\alpha - 2}(D)a^{2^\alpha - 2} b^{n-1} + \begin{cases} A(a^{2^\alpha - 2} b^{n-1} + a^{2^\alpha - 3} b^n) \end{cases}
\]

where \( A = 0 \) or \( 1 \). Hence it follows that the stiefel-whitney number

\[
\langle W_\omega(P), [P] \rangle = \langle W_\omega(c,d), [P] \rangle = f_{2^\alpha - 2}(D)
\]

\[
= \langle W_\omega(b,a(a+b)), [H] \rangle = \langle W_\omega(H), [H] \rangle
\]

This completes the proof. \( \square \)

**Proposition 2.4.** \( H(m,m+2^\alpha B) \) is bordant to \( P(2^\alpha B-1,m) \) \( \forall m \geq 0, \forall B \geq 1, \) and \( \forall \alpha \) such that \( 2^\alpha \geq m + 1. \)

**Proof.** The total Stiefel-Whitney class of \( P(2^\alpha B-1,m) \) is given by

\[
W(P) = (1+c)^{2^\alpha B-1}(1+c+d)^{m+1},
\]

where \( c^{2^\alpha B} = 0 = d^{m+1}. \)

On the other hand the total Stiefel-Whitney class of \( H(m,m+2^\alpha B) \) is given by

\[
W(H) = \frac{(1+a)^{m+1}(1+b)^{m+2^\alpha B+1}}{(1+a+b)}, \quad \text{where } a^{m+1} = 0 = b^{m+2^\alpha B+1},
\]

\[
= (1+a+b+ab)^{m+1}(1+b)^{2^\alpha B}(1+a+b)^{2^\alpha - 1}(1+b^2)\ldots(1+b^{2^\gamma})
\]

where \( 2^\gamma \leq m + 2^\alpha B < 2^{\gamma+1}, \)

\[
= (1+a+b+ab)^{m+1}(1+a+b)^{2^\alpha - 1}(1+b)^{2^\alpha(B-1)}
\]

\[
= (1+a+b+ab)^{m+1}(1+a+b)^{2^\alpha B-1}, \quad \text{since } a^{2^\alpha} = 0.
\]

Let \( W(x,y) = (1+x)^{2^\alpha B-1}(1+x+y)^{m+1} \in \mathbb{Z}_2[x,y], \) where \( (x,y) \) satisfies the following conditions:

\[
\dim x = 1, \dim y = 2, \text{ and } x^{2^m+2^\alpha B} = 0 = y^{m+1}. \quad (2.5)
\]

Then

\[
W(P) = W(c,d), \quad \text{and } W(H) = W(a + b, ab).
\]
Clearly, the pairs \((c, d)\) and \((a + b, ab)\) satisfy the conditions in (2.5).

Let \(W_i(x, y)\) be the sum of \(i\)-dimensional terms in \(W(x, y)\), where \(i > 0\). Then,

\[
W_i(x, y) = D_{0,i}x^i + D_{1,i}x^{i-2}y + \cdots + D_{m,i}x^{i-2m}y^m,
\]

where \(D_{j,i} \in \mathbb{Z}_2 \forall j = 0, 1, \ldots, m\). Let \(\omega \equiv i_1 + i_2 + \cdots + i_k = 2m + 2^a B - 1\) be a partition of \(2m + 2^a B - 1\). Then, using conditions in (2.5),

\[
W_\omega(x, y) = W_{\omega}(x, y) = \sum_{t=0}^{m} f_t(D_{0,i_1} \cdots D_{m,i_k})x^t y^{m+2^a B - 1 - 2t}
\]

where \(f_t(D_{0,i_1} \cdots D_{m,i_k}) \in \mathbb{Z}_2\) is a polynomial in \(D_{j,i_j}, 0 \leq j \leq m, 1 \leq r \leq k\). Therefore,

\[
W_\omega(c, d) = f_m(D_{0,i_1} \cdots D_{m,i_k})c^{2^a B - 1}d^m, \quad \text{since } c^{2^a B} = 0.
\]

On the other hand

\[
W_\omega(a + b, ab) = \sum_{t=0}^{m} f_t(D_{0,i_1} \cdots D_{m,i_k})(a + b)^{(2m + 2^a B - 1 - 2t)(ab)^t}.
\]

Let \(X_t = (a + b)^{(2m + 2^a B - 1 - 2t)(ab)^t}\) where \(0 \leq t \leq m\). If \(t = m\), then

\[
X_t = (a + b)^{(2^a B - 1)(ab)^m} = a^m b^{m+2^a B - 1},
\]

and if \(t < m\), then

\[
X_t = (a + b)^{(2m + 2^a B - 1 - 2t)(ab)^t} = \left(\frac{2m + 2^a B - 1 - 2t}{m - t}\right) a^{m} b^{m+2^a B - 1} + \left(\frac{2m + 2^a B - 1 - 2t}{m - t - 1}\right) a^{m-1} b^{m+2^a B} = A_t(a^m b^{m+2^a B - 1} + a^{m-1} b^{m+2^a B}),
\]

where \(A_t = 0\) or \(1\); noting that

\[
\left(\frac{2m + 2^a B - 1 - 2t}{m - t}\right) + \left(\frac{2m + 2^a B - 1 - 2t}{m - t - 1}\right) = \left(\frac{2m + 2^a B - 2t}{m - t}\right) = 0 \in \mathbb{Z}_2,
\]

looking at the lowest power of 2 in \((m - t)\). Thus,

\[
W_\omega(a + b, ab) = f_m(D_{0,i_1} \cdots D_{m,i_k})a^m b^{m+2^a B - 1} + A(a^m b^{m+2^a B - 1} + a^{m-1} b^{m+2^a B})
\]
where $A = 0$ or $1$. Hence, it follows that the Stiefel-Whitney number
\[
\langle W_\omega(P), [P] \rangle = \langle W_\omega(c, d), [P] \rangle = f_m(D_{0,i_1} \cdots D_{m,i_k})
\]
\[= \langle W_\omega(a + b, ab), [H] \rangle = \langle W_\omega(H), [H] \rangle.
\]
This completes the proof. \hfill \Box

**Proposition 2.6.** $H(2^\alpha, 2^\alpha + 1 B)$ is bordant to $P(2^\alpha + 1 B - 2^\alpha - 1, 2^\alpha)$ \(\forall \alpha \geq 1\) and \(\forall B \geq 1\).

**Proof.** The total Stiefel-Whitney class of $P(2^\alpha + 1 B - 2^\alpha - 1, 2^\alpha)$ is given by
\[
W(P) = (1 + c)^{2^\alpha + 1 B - 2^\alpha - 1}(1 + c + d)^{2^\alpha + 1},
\]
where $c^{2^\alpha + 1 B - 2^\alpha} = 0 = d^{2^\alpha + 1}$.

On the other hand the total Stiefel-Whitney class of $H(2^\alpha, 2^\alpha + 1 B)$ is given by
\[
W(H) = \frac{(1 + a)^{2^\alpha + 1}(1 + b)^{2^\alpha + 1 B + 1}}{(1 + a + b)}, \quad \text{where } a^{2^\alpha + 1} = 0 = b^{2^\alpha + 1 B + 1},
\]
\[= (1 + a)^{2^\alpha + 1}(1 + b)^{2^\alpha + 1 B + 1}(1 + a + b) \cdots (1 + a^{2^\alpha} + b^{2^\alpha})
\]
\[= (1 + a)^{2^\alpha + 1}(1 + b)^{2^\alpha + 1 B - 1 + 1}(1 + a + b)^{2^\alpha - 1}(1 + a^{2^\alpha} + b^{2^\alpha})
\]
\[= (1 + a)^{2^\alpha + 1}(1 + b)^{2^\alpha + 1 (B - 1) + 1}(1 + a + b)^{2^\alpha - 1}(1 + b^{2^\alpha})
\]
\[= (1 + a)^{2^\alpha + 1}(1 + b)^{2^\alpha + 1 (B - 1) + 1}(1 + a + b)^{2^\alpha - 1 a^{2^\alpha}}
\]
\[= (1 + a + b + ab)^{2^\alpha + 1 (1 + a + b)^{2^\alpha + 1 (B - 1) + 1}(1 + a + b)^{2^\alpha - 1}
\]
\[= (1 + a + b + ab)^{2^\alpha + 1 (1 + a + b)^{2^\alpha + 1 B - 2^\alpha - 1}
\]
\[= (1 + a + b + ab)^{2^\alpha + 1 (1 + a + b)^{2^\alpha + 1 B - 2^\alpha - 1}
\]
Let $W(x, y) = (1 + x)^{2^\alpha + 1 B - 2^\alpha - 1}(1 + x + y)^{2^\alpha + 1} \in \mathbb{Z}_2[x, y]$, where $(x, y)$ satisfies the following conditions:
\[
\dim x = 1, \dim y = 2, \text{ and } x^{2^\alpha + 1 B + 2^\alpha} = 0 = y^{2^\alpha + 1}. \quad (2.7)
\]
Then
\[
W(P) = W(c, d) \quad \text{and}
\]
\[
W(H) = W(a + b, ab) + a^{2^\alpha} (1 + b)^{2^\alpha + 1 B - 2^\alpha}.
\]
Clearly, the pairs \((a + b, ab)\) and \((c, d)\) satisfy the conditions in (2.7), noting that the term \(a^{2\alpha}b^{2\alpha+1}B\) may be omitted due to dimensional considerations.

Let \(W_i(x, y)\) be the sum of \(i\)-dimensional terms in \(W(x, y)\), where \(i > 0\). Now,

\[
W(x, y) = (1 + x)^{2\alpha + 1}B + (1 + x)^{2\alpha + 1}B^{-1}y + (1 + x)^{2\alpha + 1}B^{-2\alpha}y^{2\alpha}.
\]

Therefore,

\[
W_i(x, y) = D_i x^i + E_i x^{i-2}y + F_i x^{i-2\alpha+1}y^{2\alpha}
\]

where

\[
D_i = \binom{2\alpha+1}{i}, \quad E_i = (2\alpha+1B-1)_{i-2}, \quad F_i = (2\alpha+1B-2\alpha)_{i-2\alpha+1},
\]

using the convention that \(\binom{s}{r} = 0\) if \(s < 0\) or \(s > r\). Let \(\delta\) be the exponent of 2 in \(2^{\alpha+1}B\), \(i.e.\ 2^{\alpha+1}B = 2^\delta\). Clearly, \(\delta \geq \alpha + 1\). Now,

\[
i(i-1)D_i = (2^{\alpha+1}B + 1 - i)2^{\alpha+1}BE_i.
\]

So, it follows that if \(i = 2^\beta\) odd, with \(\beta \geq 1\), then

\[
\beta = \delta \Rightarrow D_i = E - i,
\beta < \delta \Rightarrow D_i = 0,
\beta > \delta \Rightarrow E - i = 0.
\]

Further note that \(D_i = 0 = F_i\) if \(i\) is odd. Therefore,

\[
W_i(x, y) = \begin{cases} 
E_i x^{i-2}y, & \text{if } i \text{ is odd,} \\
E_i x^{i-2}y + F_i x^{i-2\alpha+1}y^{2\alpha}, & \text{if } i = 2^\beta \text{ odd, } 1 \leq \beta < \delta, \\
D_i (x^i + x^{i-2}y) + F_i x^{i-2\alpha+1}y^{2\alpha}, & \text{if } i = 2^\delta \text{ odd,} \\
D_i x^i + F_i x^{i-2\alpha+1}y^{2\alpha}, & \text{if } i = 2^\beta \text{ odd, } \beta > \delta.
\end{cases}
\]

Let \(\omega \equiv i_1 + i_2 + \cdots + i_k = 2^{\alpha+1}B + 2^\alpha - 1\) be a partition of \(2^{\alpha+1}B + 2^\alpha - 1\). Clearly, at least one \(i_j\) must be odd. So, at least one \(W_{ij}(x, y)\) is a multiple of \(y\). Let \(i_1, i_2, \ldots, i_m\) be of type \(2^\beta\) odd, with \(0 \leq \beta < \delta\). Then, \(m \geq 1\). Let \(i_{m+1}, i_{m+2}, \ldots, i_{m+n}\) be of type \(2^\delta\) odd, and let \(i_{m+n+1}, i_{m+n+2}, \ldots, i_k\) be of type \(2^\beta\) odd, with \(\beta > \delta\). Then, we
have
\[ W_\omega(x, y) = W_{i_1}(x, y) \ldots W_{i_k}(x, y) \]
\[ = \left( \prod_{j=1}^{m} E_{i_j} x^{i_j - 2} y \right) \left( \prod_{j=m+1}^{m+n} D_{ij} (x^{i_j} + x^{i_j - 2} y) \right) \left( \prod_{j=m+n+1}^{k} D_{ij} x^{i_j} \right) \]
\[ = \sum_{t=0}^{n} D.E.G_t x^{2^{a+1}B + 2^a - 1 - 2(m+t)} y^{m+t}, \]
where \( D = \prod_{j=m+1}^{k} D_{ij}, \) \( E = \prod_{j=1}^{m} E_{ij}, \) \( G_t = \binom{n}{t}, \) \( 0 \leq t \leq n. \) Thus,
\[ W_\omega(c, d) = \begin{cases} D.E.G_{2^a-m} c^{2^{a+1}B} - 2^a - 1 d^{2^a}, & \text{if } 0 \leq 2^a - m \leq n \\ 0, & \text{otherwise.} \end{cases} \]
On the other hand
\[ W_\omega(a + b, ab) = \sum_{t=0}^{n} D.E.G_t (a + b)^{2^{a+1}B + 2^a - 1 - 2(m+t)} (ab)^{m+t}. \]
Let \( X_t = (a + b)^{2^{a+1}B + 2^a - 1 - 2(m+t)} (ab)^{m+t}, \) where \( 0 \leq t \leq n. \) Clearly, if \( m + t > 2^a \) then \( X_t = 0. \) If \( m + t = 2^a \) then
\[ X_t = (a + b)^{2^{a+1}B + 2^a - 1 (ab)^{2^a} = a^{2^a} b^{2^{a+1}B - 1}. \]
If \( m + t < 2^a \) then
\[ X_t = \left( \frac{2^{a+1}B + 2^a - 1 - 2(m+t)}{2^a - (m+t)} \right) a^{2^a} b^{2^{a+1}B - 1} + \left( \frac{2^{a+1}B + 2^a - 1 - 2(m+t)}{2^a - (m+t) - 1} \right) a^{2^a - 1} b^{2^{a+1}B} \]
\[ = A_t (a^{2^a} b^{2^{a+1}B - 1} + a^{2^a - 1} b^{2^{a+1}B}), \]
where \( A_t = 0 \) or \( 1; \) noting that
\[ \left( \frac{2^{a+1}B + 2^a - 1 - 2(m+t)}{2^a - (m+t)} \right) + \left( \frac{2^{a+1}B + 2^a - 1 - 2(m+t)}{2^a - (m+t) - 1} \right) \]
\[ = \left( \frac{2^{a+1}B + 2^a - 2(m+t)}{2^a - (m+t)} \right) = 0 \in \mathbb{Z}_2, \]
looking at the lowest power of 2 in \((m+t). \) Hence it follows that
\[ W_\omega(a + b, ab) \]
\[ = \begin{cases} D.E.(G_{2^a-m} a^{2^a} b^{2^{a+1}B - 1} + A.g(a, b)), & \text{if } 0 \leq 2^a - m \leq n, \\ A'.g(a, b), & \text{otherwise,} \end{cases} \]
where \( g(a, b) = a^{2\alpha}b^{2\alpha+1}B-1 + a^{2\alpha-1}b^{2\alpha+1}B \), and \( A, A' \in \mathbb{Z}_2 \). Thus, we have
\[
\langle W_\omega(c, d), [P] \rangle = \begin{cases} 
D.E.G_{2\alpha-m}, & \text{if } 0 \leq 2\alpha - m \leq n \\
0, & \text{otherwise}
\end{cases} = \langle W_\omega(a + b, ab), [H] \rangle.
\]

Now, \( W_i(H) = W_i(a + b, ab) + N_i(a, b) \), where
\[
N_i(a, b) = \left( \frac{2^{\alpha+1}B - 2^\alpha}{i - 2^\alpha} \right) a^{2^\alpha}b^{i-2^\alpha}.
\]

Note that
\[
(i) \ N_i(a, b)N_j(a, b) = 0, \ \forall \ i, j \geq 1, \\
(ii) \ N_i(a, b)W_j(a + b, ab) = 0, \ \forall \ i \geq 1, \ \text{if } j \text{ is odd,} \quad \text{and} \\
(iii) \ N_i(a, b) = 0, \ \text{if } i \text{ is odd.}
\]

Hence, it follows that
\[
W_\omega(H) = W_{i_1}(H) \ldots W_{i_k}(H)
\]
\[
= W_\omega(a + b, ab) + \sum_{j=1}^{k} N_{ij}(a, b)W_{i_j}(a + b, ab) \ldots
\]
\[
\tilde{W}_{i_j}(a + b, ab) \ldots W_{i_k}(a + b, ab)
\]
\[
= W_\omega(a + b, ab), \quad \text{since } \omega \text{ has an odd summand.}
\]

Thus, the Stiefel-Whitney number
\[
\langle W_\omega(P), [P] \rangle = \langle W_\omega(c, d), [P] \rangle = \langle W_\omega(a + b, ab), [H] \rangle = \langle W_\omega(H), [H] \rangle.
\]

This completes the proof. \( \square \)

In [5] it has been proved that

**Result 2.8.** \( \mathcal{N}_* \) is a polynomial ring over \( \mathbb{Z}_2 \) with independent generators \( \mathbb{R}P^{2t} \) and \( H(2^k, 2t2^k) \) where \( t, k \geq 1 \).

Therefore, in view of Remark 2.1 and Proposition 2.6 we have

**Remark 2.9.** The Milnor manifolds lying in the generating set of \( \mathcal{N}_* \) over \( \mathbb{Z}_2 \) are all bordant to Dold manifolds.

The following proposition is not directly related to the question we are investigating. However it has its own significance.

**Proposition 2.10.** \( H(m, 2^\alpha - 1) \) is bordant to \( \mathbb{R}P^m \times \mathbb{R}P^{2^\alpha - 2} \) \( \forall m \geq 0, \) and \( \forall \alpha \) such that \( 2^\alpha > m + 1 \).
Proof. The total Stiefel-Whitney class of $H(m, 2^\alpha - 1)$ is given by
\[
W(H) = \frac{(1 + a)^{m+1}(1 + b)^{2^\alpha}}{(1 + a + b)}, \quad \text{where } a^{m+1} = 0 = b^{2^\alpha},
\]
\[
= (1 + a)^{m+1}(1 + a + b)^{2^\alpha - 1}.
\]

On the other hand the total Stiefel-Whitney class of the product $M = \mathbb{R}P^m \times \mathbb{R}P^{2^\alpha - 2}$ is given by
\[
W(M) = (1 + u)^{m+1}(1 + v)^{2^\alpha - 1}.
\]
where $u \in H^*(\mathbb{R}P^m; \mathbb{Z}_2)$, $v \in H^*(\mathbb{R}P^{2^\alpha - 2}; \mathbb{Z}_2)$ are the generators of the respective cohomology rings. Let
\[
W(x, y) = (1 + x)^{m+1}(1 + y)^{2^\alpha - 1},
\]
where $(x, y)$ satisfies the following conditions:
\[
\dim x = \dim y = 1, \quad \text{and } x^{m+1} = 0. \quad (2.11)
\]
Then
\[
W(H) = W(a, a + b) \quad \text{and} \quad W(M) = W(u, v).
\]
Clearly, the pairs $(a, a + b)$ and $(u, v)$ satisfy the conditions in (2.11). Let $W_i(x, y)$ be the sum of $i$-dimensional terms in $W(x, y)$, where $i > 0$. Then, $W_i(x, y)$ is a homogeneous polynomial in $x, y$ of dimension $i$. Let $\omega \equiv i_1 + i_2 + \cdots + i_k = m + 2^\alpha - 2$ be a partition of $m + 2^\alpha - 2$. Then, using conditions in (2.11),
\[
W_\omega(x, y) = W_{i_1}(x, y) \cdots W_{i_k}(x, y) = \sum_{j=0}^{m} D_j x^j y^{m+2^\alpha - 2 - j}
\]
where $D_j \in \mathbb{Z}_2 \forall j = 0, 1, \ldots, m$. Therefore,
\[
W_\omega(M) = W_\omega(u, v) = D_m u^m v^{2^\alpha - 2}.
\]

On the other hand,
\[
W_\omega(H) = W_\omega(a, a + b) = \sum_{j=0}^{m} D_j a^j (a + b)^{m+2^\alpha - 2 - j}.
\]
Let $X_t = a^j(a + b)^{m+2^\alpha - 2 - j}$ where $0 \leq j \leq m$. Then $X_m = a^m b^{2^\alpha - 2}$, and if $j < m$,
\[
X_j = \left(\frac{m + 2^\alpha - 2 - j}{m - j}\right) a^m b^{2^\alpha - 2} + \left(\frac{m + 2^\alpha - 2 - j}{m - j - 1}\right) a^{m-1} b^{2^\alpha - 1}
\]
\[
= A_j b^{2^\alpha - 2} + a^{m-1} b^{2^\alpha - 1},
\]
where $A_j = 0$ or $1$; noting that
\[
\left( m + 2^\alpha - 2 - j \right)_{m-j} + \left( m + 2^\alpha - 2 - j \right)_{m-j-1} = \left( 2^\alpha - 1 + m - j \right)_{m-j} = 0 \in \mathbb{Z}_2,
\]
looking at the lowest power of 2 in $(m-j)$. Thus,
\[
W_\omega(H) = D_m a^m b^{2^\alpha-2} + A(a^m b^{2^\alpha-2} + a^{m-1} b^{2^\alpha-1}),
\]
where $A = 0$ or $1$. Hence, it follows that the Stiefel-Whitney number
\[
\langle W_\omega(H), [H] \rangle = D_m = \langle W_\omega(M), [\mathbb{R}P^m \times \mathbb{R}P^{2^\alpha-2}] \rangle.
\]
This completes the proof. \qed

3. Milnor manifolds which are not bordant to Dold manifolds

First of all note that the Milnor manifolds, which are boundaries, are trivially bordant to Dold manifolds which are also boundaries (of course of the same dimensions) and in that context we have the following results from [4] and [3]

**Result 3.1.** A Milnor manifold $H(m, n)$, with $m \leq n$, bounds if and only if at least one of the following conditions holds:
(a) $m = n$,
(b) $m = 1$,
(c) $mn \equiv 1 \pmod{2}$,
(d) $n \equiv 2 \pmod{4}$ and $m + 1 < 2^{\nu(n+2)}$, where $\nu(n+2)$ is the largest integer such that $2^{\nu(n+2)} | (n+2)$.

**Result 3.2.** A Dold manifold $P(m, n)$ bounds if and only if one of the following conditions holds:
(a) $n$ is odd,
(b) $n$ is even, $m$ is odd, $m > n$ and $2^{\nu(m-n-1)} > n$.

The class of Milnor manifolds which are not bordant to Dold manifolds is much bigger than the class of Milnor manifolds which are actually bordant to Dold manifolds, and it is quite evident from the following proposition

**Proposition 3.3.** Let $m$ be odd, and $n$ be even such that $m < n$. Then $H(m, n)$ is not bordant to a Dold manifold unless $H(m, n)$ itself is a boundary.
Proof. Assume that $H(m, n)$ is not a boundary. We know (see [5]) that $H(m, n)$ fibres over $\mathbb{R}P^m$ with fibre $\mathbb{R}P^{n-1}$. Therefore, the mod 2 Euler characteristic

$$
\chi(H(m, n)) = \chi(\mathbb{R}P^m)\chi(\mathbb{R}P^{n-1}) = 0.
$$

Let $d = \dim (H(m, n)) = m + n - 1$. Clearly $d$ is even and so the non-boundary Dold manifolds of dimension $d$ are of the type $P(r, s)$ where both $r$ and $s$ are even (by Result 3.2) and $r + 2s = d$. Since (see [1]) $P(r, s)$ fibres over $\mathbb{R}P^r$ with fibre $\mathbb{C}P^s$, it follows that the mod 2 Euler characteristic

$$
\chi(P(r, s)) = \chi(\mathbb{R}P^r)\chi(\mathbb{C}P^s) \neq 0.
$$

Thus, $H(m, n)$ is not bordant to a Dold manifold. \hfill \Box

At this moment we can not say much about the remaining Milnor manifolds; however the Results 3.1 and 3.2 together with some computer calculations suggest us to make the following conjecture:

**Conjecture 3.4.** The non-boundary Milnor manifolds which are not considered in Propositions 2.2, 2.4, 2.6, 2.10 and 3.3, are not bordant to Dold manifolds.
