**Keywords:** *Alistipes obesi*, genome, culturomics, taxono-genomics

*Alistipes obesi* sp. nov. strain ph8T is the type strain of *A. obesi*, a new species within the genus *Alistipes*. This strain, whose genome is described here, was isolated from the fecal flora of a 26-year-old woman suffering from morbid obesity. *A. obesi* is an obligately anaerobic rod. Here we describe the features of this organism, together with the complete genome sequence and annotation. The 3,162,233 bp long genome (1 chromosome but no plasmid) contains 2,623 protein-coding and 49 RNA genes, including three rRNA genes.

**Introduction**

*Alistipes obesi* strain ph8T (CSUR= P186, DSMZ= 25724) is the type strain of *A. obesi* sp. nov. This bacterium is a Gram-negative, anaerobic, indole-negative bacillus and was isolated from the stool of a French patient suffering from morbid obesity as part of a culturomics study aiming at cultivating individually all species within human feces [1].

We recently proposed that genomic and proteomic data, which do not suffer from the lack of reproducibility and inter-laboratory comparability that the “gold standard” DNA-DNA hybridization and G+C content determination does [2], may be included in the official description of new bacterial species [3-14].

The genus *Alistipes* (Rautio *et al.* 2003) [15] is currently comprised of five species, including *A. finegoldii* (Rautio *et al.* 2003) [15], *A. indistinctus* (Nagai *et al.* 2010) [16], *A. onderdonkii* (Song *et al.* 2006) [17], *A. putredinis* (Rautio *et al.* 2003) [15], and *A. shahii* (Song *et al.* 2006) [17]. In addition, we recently described two new species, *A. senegalensis* (Mishra *et al.* 2012) [6] and *A. timonensis* (Lagier *et al.* 2012) [7] that were isolated from the digestive microbiota from an asymptomatic Senegalese patient [1]. Members of the genus *Alistipes* are strictly anaerobic Gram-negative rods that are closely related to the *Bacteroides fragilis* group, with which they share the characteristic of bile-resistance and indole-positivity. Most *Alistipes* species have been isolated from human specimens, including the normal intestinal flora [17] and in cases of bacteremia, appendicitis, peri-rectal and brain abscess [18-20]. A 16S rRNA phylogenetic analysis revealed that *A. obesi* was closely related to *A. shahii*, *A. senegalensis* and *A. timonensis*. To the best of our knowledge, *A. obesi* sp. nov. is the first *Alistipes* species isolated from the digestive flora of an obese patient.

Here we present a summary classification and a set of features for *A. obesi* sp. nov. strain ph8T together with the description of the complete genome sequencing and annotation. These characteristics support the circumscription of the species *A. obesi*.

**Classification and features**

A stool sample was collected from an obese, 26-year-old woman living in Marseille, France, who suffered from morbid obesity: BMI=48.2 (118.8 kg, 1.57 meter). At the time of stool sample collection she was not a drug user and was not on a diet. The patient gave an informed and signed consent, and the agreement of the local ethics committee of the IFR48 (Marseille, France) was obtained under agreement 11-017. The fecal specimen was preserved at -80°C after collection. Strain ph8 (Table 1) was isolated in 2011 by anaerobic cultivation at 37°C on 5% sheep blood-enriched Columbia agar (BioMerieux, Marcy l’Etoile, France), after 11 days of pre-incubation of the stool sample with addition of rumen fluid in an anaerobic blood culture bottle.
This strain exhibited a 93.5% 16S rRNA sequence similarity with *A. shahii* (Song et al. 2006) [17], the phylogenetically closest validated *Alistipes* species (Figure 1), and 94.26 and 93.38% with *A. senegalensis* (Mishra et al. 2012) [6] and *A. timonensis* (Lagier et al. 2012) [7], respectively. Among validly published *Alistipes* species [31], the percentage of 16S rRNA sequence similarity ranges from 90.5% between *A. indistinctus* (Nagai et al. 2010) [16] and *A. shahii* (Song et al. 2006) [17], to 96.8% between *A. finegoldii* (Rautio et al. 2003) [8] and *A. onderdonkii* (Song et al. 2006) [17]. As a consequence, and despite the fact that strain ph8 exhibited a 16SrRNA sequence similarity with the nearest validly published species lower than the 95.0% cutoff usually regarded as a threshold for the creation of new genus [32], we considered it as a new species within the genus *Alistipes*.

Table 1. Classification and general features of *Alistipes obesi* strain ph8\(^1\) according to the MIGS recommendations [21]

| MIGS ID   | Property                  | Term                     | Evidence code* |
|-----------|---------------------------|--------------------------|----------------|
| MIGS-6.3  | Salinity                  | Unknown                  | IDA            |
| MIGS-22   | Oxygen requirement        | Anaerobic                | IDA            |
| MIGS-6    | Habitat                   | Human gut                | IDA            |
| MIGS-15   | Biotic relationship       | Free living              | IDA            |
| MIGS-14   | Isolation                 | Human feces              | IDA            |
| MIGS-4    | Geographic location       | France                   | IDA            |
| MIGS-5    | Sample collection time    | January 2011             | IDA            |
| MIGS-4.1  | Latitude                  | 43.296482                | IDA            |
| MIGS-4.1  | Longitude                 | 5.36978                  | IDA            |
| MIGS-4.3  | Depth                     | Surface                  | IDA            |
| MIGS-4.4  | Altitude                  | 0 m above sea level      | IDA            |

Evidence codes - IDA: Inferred from Direct Assay; TAS: Traceable Author Statement (i.e., a direct report exists in the literature); NAS: Non-traceable Author Statement (i.e., not directly observed for the living, isolated sample, but based on a generally accepted property for the species, or anecdotal evidence). These evidence codes are from the Gene Ontology project [30]. If the code is IDA, then the property was directly observed for a live isolate by one of the authors or an expert mentioned in the acknowledgements.
Different growth temperatures (25, 30, 37, 45°C) were tested; no growth occurred at 25°C or 30°C, growth occurred at 37°C and 45°C, and optimal growth was observed at 37°C. Colonies were 0.5 mm in diameter on 5% blood-enriched Columbia agar, are translucent and light grey. Growth of the strain was tested under anaerobic and microaerophilic conditions using GENbag anaer and GENbag microaer systems, respectively (BioMerieux), and in the presence of air, with or without 5% CO₂. Optimal growth was achieved anaerobically. No growth was observed under aerobic and microaerophilic conditions. Gram staining showed Gram-negative rods (Figure 2). A motility test was positive. Cells grown on agar and diameter ranged from 0.44 µm to 0.76 µm, with a mean diameter of 0.61 µm by electron microscopy (Figure 3). Comparison between seven *Alistipes* strains is presented in Table 2.

Strain ph8T exhibited catalase activity but was not oxidase positive. Using the API RAPID ID 32A (BioMerieux), a positive reaction was obtained for α-galactosidase, β-galactosidase, N-acetyl-β-glucosaminidase, alkaline phosphatase, leucyl glycine arylamidase, and alanine arylamidase. All other tested reactions were negative, notably nitrate reduction, indole formation, urease, arginine dihydrolase, α- and β-glucosidase, 6-phospho-β-galactosidase, arginine arylamidase, proline arylamidase, phenylalanine arylamidase, leucine arylamidase, pyrog glutamic acid arylamidase, tyrosine arylamidase, glycine arylamidase, histidine arylamidase, glutamyl glutamic acid arylamidase, serine arylamidase, and mannose and raffinose fermentation. Using the Api Zym system (BioMerieux), esterase, esterase lipase, acid phosphatase, Naphtol-AS-BI phosphohydrolase and α-galactosidase activities were positive. *A. obesi* is susceptible to imipenem, ciprofloxacin, metronidazole, nitrofurantoin and rifampicin, but resistant to penicillin G, amoxicillin, amoxicillin-clavulanic acid, erythromycin, vancomycin, gentamicin 15 and gentamycin 500, doxycycline, ceftriaxone and trimethoprim/sulfamethoxazole. By comparison with *A. senegalensis*, *A. obesi* differed in motility, α-galactosidase, β-galactosidase, indole production, β-glucuronidase, arginine arylamidase, glycine arylamidase, proline arylamidase and mannose fermentation [6]. By comparison with *A. timonensis*, *A. obesi* differed in motility, N-acetyl-β-glucosaminidase and N-acetyl-β-glucosaminidase [7]. By comparison with *A.putredinis*, *A.obesi* differed in motility, N-acetyl-β-glucosaminidase and indole production [15]. By comparison with *A.finegoldii*, *A.obesi* differed in catalase, α-glucosidase and indole production [15]. Finally, *A. obesi* differed in indole production, catalase, esterase, esterase lipase and alpha-glucosidase with *A. shahii* [17], and alpha-glucosidase, esterase, esterase lipase and acid phosphatase with *A. indistinctus* [16].

† *A. obesi* sp. nov strain ph8, *Alistipes timonensis* strain JC136, *Alistipes senegalensis* strain JC50, *Alistipes putredinis* strain ATCC 29800, *Alistipes finegoldii* strain AHN 2437, *Alistipes shahii* strain ATCC BAA-1179 and *Alistipes indistinctus* strain YIT 12060.
Matrix-assisted laser-desorption/ionization time-of-flight (MALDI-TOF) MS protein analysis was carried out as previously described [33]. Briefly, a pipette tip was used to pick one isolated bacterial colony from a culture agar plate, and to spread it as a thin film on a MTP 384 MALDI-TOF target plate (Bruker Daltonics, Leipzig, Germany). Four distinct deposits were done for strain ph8 from four isolated colonies. Each smear was overlaid with 2µL of matrix solution (saturated solution of alpha-cyano-4-hydroxycinnamic acid) in 50% ace-tonitrile, 2.5% tri-fluoracetic-acid, and allowed to dry for five minutes. Measurements were performed with a Microflex spectrometer (Bruker). Spectra were recorded in the positive linear mode for the mass range of 2,000 to 20,000 Da (parameter settings: ion source 1 (IS1), 20 kV; IS2, 18.5 kV; lens, 7 kV). A spectrum was obtained after 675 shots at a variable laser power. The time of acquisition was between 30 seconds and 1 minute per spot. The four ph8 spectra were imported into the MALDI BioTyper software (version 2.0, Bruker) and analyzed by standard pattern matching (with default parameter settings) against the main spectra of 3,769 bacteria including the spectra from A. finegoldii, A. onderdonkii, A. shahii, A. senegalensis and A. timonensis used as reference data, in the BioTyper database. The method of identification included the m/z from 3,000 to 15,000 Da. For every spectrum, 100 peaks at most were taken into account and compared with spectra in the database. A score enabled either an identification, or non-identification, from the tested species: a score > 2 with a validly published species enabled a presumed identification at the species level, a score > 1.7 but < 2 enabled a presumed identification at the genus level; and a score < 1.7 did not enable an identification. For strain ph8, the obtained score was 1.1, suggesting that this isolate was not a member of a known species. We incremented our database with the spectrum from strain ph8 (Figure 4). Finally, the gel view allows us to highlight the spectra differences with other of Alistipes genera members (Figure 5).

Genome sequencing information
The organism was selected for sequencing on the basis of its phylogenetic position and 16S rRNA similarity to other members of the genus Alistipes, and is part of a study of the human digestive flora aiming at isolating all bacterial species contained within human feces. It was the seventh genome of an Alistipes species and the first genome of Alistipes obesi sp. nov. The EMBL accession number is CAHA00000000 and consists of 59 contigs. Table 3 shows the project information and its association with MIGS version 2.0 compliance [21].

Figure 2. Gram staining of A. obesi strain ph8T
Figure 3. Transmission electron microscopy of \textit{A. obesi} strain ph8\textsuperscript{T}, using a Morgani 268D (Philips) at an operating voltage of 60kV. The scale bar represents 500 nm.

Figure 4. Reference mass spectrum from \textit{A. obesi} strain ph8\textsuperscript{T}. Spectra from 4 individual colonies were compared and a reference spectrum was generated.
Figure 5. Gel view comparing *Alistipes obesi* ph8T spectra with other members into *Alistipes* genera (*Alistipes timonensis*, *Alistipes senegalensis*, *Alistipes shahii*, *Alistipes onderdonkii* and *Alistipes finegoldii*). The Gel View displays the raw spectra of all loaded spectrum files arranged in a pseudo-gel like look. The x-axis records the m/z value. The left y-axis displays the running spectrum number originating from subsequent spectra loading. The peak intensity is expressed by a Gray scale scheme code. The color bar and the right y-axis indicate the relation between the color a peak is displayed with and the peak intensity in arbitrary units.

Alistipes obesi sp. nov

Growth conditions and DNA isolation
A. obesi sp. nov. strain ph8 T (CSUR= P186, DSM=25724), was grown anaerobically on 5% sheep blood-enriched Columbia agar (BioMerieux) at 37°C. Four petri dishes were spread and resuspended in 3x100µl of G2 buffer (EZ1 DNA Tissue kit, Qiagen, Hilden, Germany). A first mechanical lysis was performed by glass powder on the Fastprep-24 device (MP Biomedicals, Santa Ana, CA, USA) using 2x20 seconds cycles. DNA was then treated with 2.5 µg/µL lysozyme for 30 minutes at 37°C and extracted using the BioRobot EZ 1 Advanced XL (Qiagen). The DNA concentration was measured at 120.7 ng/µL using the Genios fluorometer (Tecan, Lyon, France).

Genome sequencing and assembly
Five µg of DNA was mechanically fragmented on a Hydroshear device (Digilab, Holliston, MA,USA) with an enrichment size at 3-4kb. The DNA fragmentation was visualized using the 2100 BioAnalyzer (Agilent, Massy, France) on a DNA labchip 7500 with an optimal size of 3.213 kb. A 3-kb paired-end library was constructed using the GS Rapid library Prep kit (Roche) according to the 454 GS FLX Titanium paired-end protocol. Circularization and nebulization were performed and generated a pattern with an optimal size of 454 bp. After PCR amplification through 15 cycles followed by double size selection, the single stranded paired-end library was then quantified using the Genios fluorometer (Tecan) at 390 pg/µL. The library concentration equivalence was calculated as 1.58E+08 molecules/µL. The library was stored at -20°C until further use.

The paired-end library was clonally-amplified with 1cpb in 4 SV-emPCR reactions with the GS Titanium SV emPCR Kit (Lib-L) v2 (Roche). The yield of the emPCR was 18.6%, in the 5 to 20% range recommended by the Roche procedure. Approximately 790,000 beads were loaded on one quarter region of a GS Titanium PicoTiterPlate PTP Kit 70×75 and sequenced with the GS FLX Titanium Sequencing Kit XLR70 (Roche). The run was performed overnight and then analyzed on the cluster through the gsRunBrowser and Newbler assembler (Roche). A total of 192,803 passed filter wells were obtained and generated 56.6 Mb with a length average of 293.5 bp. The passed filter sequences were assembled using Newbler with 90% identity and 40 bp as overlap. The final assembly identified 3 scaffolds and 59 contigs (>1,500bp), for a genome size of 3.16 Mb.

Genome annotation
Open Reading Frames (ORFs) were predicted using Prodigal [34] with default parameters but the predicted ORFs were excluded if they spanned a sequencing gap. The predicted bacterial protein sequences were searched against the GenBank database and the Clusters of Orthologous Groups (COG) databases using BLASTP. The trNAScanSE tool [35] was used to find tRNA genes, whereas ribosomal RNAs were found by using RNAmmer [36] and BLASTn against GenBank. Signal peptides and transmembrane helices were predicted using SignalP [37] and TMHMM [38], respectively. ORFans were identified if their BLASTP E-value was lower than 1e-03 for alignment length greater than 80 amino acids. If alignment lengths were smaller than 80 amino acids, we used an E-value of 1e-05. Such parameter thresholds have already been used in previous works to define ORFans. To estimate the mean level of nucleotide sequence similarity at the genome level between Alistipes obesi strain ph8T and other members of the Alistipes genera, we compared genomes two by two and determined the mean percentage of nucleotide sequence identity among orthologous ORFs using BLASTn. Orthologous genes were detected using the Proteinortho software [39]. We compared A. obesi strain ph8T with A. finegoldii strain AHN 2437 (GenBank accession number CP003274), A. indistinctus strain YIT 12060 (ADLD00000000), A. putredinis strain DSM 17216 (ABFK00000000), A. senegalensis strain JC50T (CAHI00000000), A. shahii strain WAL 8301 (FP929032) and A. timonensis strain JC136T (CAEG00000000).

Genome properties
The genome is 3,162,233 bp long (1 chromosome, but no plasmid) with a 58.6% G+C content (Table 4, Figure 6). Of the 2,672 predicted genes, 2,623 were protein-coding genes and 49 were RNAs. A total of 1,409 genes (52.75%) were assigned a putative function. One hundred twenty-seven genes were identified as ORFans (4.8%). The remaining genes were annotated as hypothetical proteins. The distribution of genes into COGs functional categories is presented in Table 5. The properties and the statistics of the genome are summarized in Tables 4 and 5.
### Table 4. Nucleotide content and gene count levels of the genome

| Attribute                        | Value       | % of total<sup>a</sup> |
|----------------------------------|-------------|-------------------------|

Alistipes obesi sp. nov

Figure 6. Graphical circular map of the chromosome. From outside to the center: Genes on forward strand (colored by COG categories), genes on reverse strand (colored by COG categories), RNA genes (tRNAs green, rRNAs red), GC content, GC skew.

Comparison with the genomes of other Alistipes species

Currently, the genomes from six validly published Alistipes species: A. finegoldii strain DSM 17242 (GenBank accession number CP003274), A. indistinctus strain YIT 12060 (ADLD00000000), A. putredinis strain DSM 17216 (ABFK00000000) and A. shahii strain WAL 8301 (FP929032), A. senegalensis strain JC50 (CAHI00000000) and A. timonensis strain JC136 (CAEG00000000) are available. The draft genome of A. obesi is larger than A. indistinctus and A. putredinis (3.16 vs 2.85 and 2.55Mb, respectively), but of a smaller size than A. finegoldii, A. shahii, A. senegalensis and A. timonensis (3.73, 3.76, 4.01 and 3.49Mb, respectively). With the exception of A. timonensis, which exhibits a value of 58.8%, A. obesi has a higher G+C content than A. finegoldii, A. indistinctus, A. putredinis A. shahii and A. senegalensis (58.6 vs 56.6, 54.8, 53.3, 57.6 and 58.4%, respectively. A. obesi has more predicted genes than A. indistinctus and A. putredinis (2,619 vs 2,342 and 2,335 respectively), but fewer than A. finegoldii, A. shahii, A. senegalensis or A. timonensis (3,231, 3,132, 3,161, and 2,709, respectively). In addition, A. obesi shared 1,417,1,462, 1,429, 1,431, 1,135 and 1,218 orthologous genes with A. timonensis, A. senegalensis, A. shahii, A. finegoldii, A. indistinctus and A. putredinis respectively. The average nucleotide sequence identity ranged from 69.70 to 90.98 % among Alistipes species, and from 70.00 to 76.81% between A. obesi and other species, thus confirming its new species status (Table 6).
Table 6. Number of orthologous genes (upper right), average nucleotide identity levels (lower left) between pairs of genomes and numbers of proteins per genome (bold) [39].

|        | A. obesi | A. timonensis | A. senegalensis | A. shahii | A. finegoldii | A. indistinctus | A. putredinis |
|--------|----------|---------------|----------------|-----------|--------------|----------------|--------------|
| A. obesi | 2,619   | 1,417         | 1,462          | 1,429     | 1,431        | 1,135          | 1,218        |
| A. timonensis | 76.19 | 2,709         | 1,764          | 1,650     | 1,585        | 1,210          | 1,238        |
| A. senegalensis | 76.40 | 90.98         | 3,161          | 1,739     | 1,660        | 1,218          | 1,277        |
| A. shahii | 76.81   | 80.03         | 86.33          | 3,132     | 1,674        | 1,155          | 1,270        |
| A. finegoldii | 76.23 | 81.14         | 82.04          | 82.90     | 3,231        | 1,202          | 1,303        |
| A. indistinctus | 70.00 | 70.05         | 70.02          | 70.00     | 69.91        | 2,342          | 1,038        |

Conclusion
On the basis of phenotypic, phylogenetic and genomic analyses (taxonom-genomics), we formally propose the creation of A. obesi sp. nov., which contains strain ph8T. This bacterium has been cultivated from an obese patient in Marseille, France.

Description of Alistipes obesi sp. nov.

Alistipes obesi (o.be.si. L. masc. gen. adj. obesi of an obese, the disease presented by the patient from whom the type strain ph8T was isolated). Colonies are 0.5 mm in diameter and are translucent and light grey on blood-enriched Columbia agar. Cells are rod-shaped with a mean diameter of 0.61 µm. Optimal growth is achieved anaerobically. No growth is observed in aerobic or microaerophilic conditions. Growth occurs between 37°C-45°C, with optimal growth observed at 37°C. Cells stain Gram negative and are motile. Catalase, α-galactosidase, β-galactosidase, N-acetyl-β-glucosaminidase, acid phosphatase, alkaline phosphatase, leucyl glycine arylamidase, alanine arylamidase, esterase, esterase lipase and Naphtol-AS-BI phosphohydrolase activities are present. Oxidase, nitrate reduction, indole formation, urease, arginine dihydrolase, α- and β-glucosidase, 6-phospho-β-galactosidase, arginine arylamidase, proline arylamidase, phenylalanine arylamidase, leucine arylamidase, pyroglutamic acid arylamidase, tyrosine arylamidase, glycine arylamidase, histidine arylamidase, glutamyl glutamic acid arylamidase and serine arylamidase, mannose and raffinose fermentation activities are absent. Cells are susceptible to imipenem, ciprofloxacin, metronidazole, nitrofurantoin and rifampicin, but resistant to penicillin G, amoxicillin, amoxicillin-clavulanic acid, erythromycin, vancomycin, gentamicin, doxycycline, ceftriaxone and trimethoprim/sulfamethoxazole. The G+C content of the genome is 58.6%. The 16S rRNA and genome sequences are deposited in Genbank under accession numbers JN837494 and CAHA00000000, respectively. The type strain ph8T (CSUR= P186 = DSM 25724) was isolated from the fecal flora of an obese patient in France.
