ABSTRACT

This study aims to determine the relationship between the principal’s transformational leadership behavior and the quality of learning in SMPNs in Kota Selatan Subdistrict, Gorontalo City, the relationship between teacher achievement motivation and learning quality in SMPNs in Kota Selatan Subdistrict, Gorontalo City, the relationship between principals’ transformational leadership behavior and teacher achievement motivation with the quality of learning at SMPN in Kota Selatan District, Gorontalo City. The sample calculation is 10% of the population of 174 so the sample used in this study is 64 employees. This study uses a quantitative correlation type approach. The results: 1) In testing the significance of the correlation coefficient, it turns out that the value of tcount is greater than t-list (t-count > t-list = 2.729 > 1.999) or the price of t-count is outside the acceptance of H0. So it can be concluded that the correlation above is really significant. 2) In testing the significance of the correlation coefficient, it turns out that the price of tcount is greater than tList (tcount > tList = 5.587 < 1.999) or the price of t-count is outside acceptance. 3) Principal transformational leadership behavior and teacher achievement motivation have a close relationship with learning quality. Seen from the results of the test significance test that the calculated F value is 15.7678. Thus, the hypothesis which states that there is a relationship between the principal's
transformational leadership behavior and the teacher's achievement motivation with the quality of learning is accepted.

## INTRODUCTION

Education is a conscious, planned effort to create a learning atmosphere and learning process so that students can actively develop their potential to have religious spiritual strength, self-control, personality, intelligence, noble character, and skills needed for themselves, society, nation and state. (Law on National Education System No. 20 of 2003). In order to achieve this goal, the government has set 8 educational standards as stated in Law Number 19 of 2005 concerning National Education Standards. Therefore, education personnel have an important role in creating the quality of learning (Apriana et al., 2019). Quality of education is the ability of schools to manage schools operationally and efficiently on components related to schools, so as to produce added value to these components according to applicable norms or standards (Kemendikbud, 2014:7). Quality of learning is achieved if the input, process, output, teachers, facilities and infrastructure, and costs have met the National Education Standards (SNP). Suharsimi Arikunto explains that the most important thing in the context of learning is the teacher and how the learning practices are implemented. The position of the teacher in the world of education is very central and strategic to achieve educational targets (Irmayani, Wardiah, & Kristiawan, 2018). Therefore, in the future, teachers will be increasingly required to make improvements and also increase and adjust their competence mastery (Kosholap et al., 2021). Education in the future requires professional teachers with a high level of knowledge and skills.

Professional teachers will be able to carry out their duties professionally so as to produce quality and marketable output in accordance with the need of user education (Adedeji, 2018). Becoming a professional education staff will not be taken for granted without efforts to improve, develop, and foster teacher human resources (HR) (Sutherland, 2018). One of the processes of improving human resources is by developing professionalism through the leadership of the principal (Wahyudin, Winara, & Permana, 2021). This is because the principal has a very close relationship with various aspects of life in schools such as school discipline, the school's cultural climate, the decline in student misbehavior, and the achievement motivation of teachers and students (Wandasari, Kristiawan, & Arafat, 2019). As the leader of an educational institution, the principal is an educational leader who is directly related to the implementation of educational programs in schools. (Khalifa, 2020). states that the achievement of educational goals is highly dependent on the leadership skills and wisdom of the principal who is one of the educational leaders. This is because the principal is a professional official in the school organization who is in charge of managing all organizational resources and collaborating with teachers in educating students to achieve educational goals (Romlah & Latief, 2021). In the context of the school environment, a principal also needs to have transformational leadership as a process in which leaders and followers can raise each other's levels of morality and motivation to a higher level (Bakti & Hartono, 2022). In this case, employees...
feel trust, admiration, and respect for their leaders so that they are motivated to do more than what is expected of them (Ribeiro, Yücel, & Gomes, 2018). Transformational leadership can be demonstrated by anyone in the organization and in any position.

Based on the results of initial observations that school principals in developing school quality have not met expectations, so efforts must be made to improve the quality of schools, including through training and improving the quality of teachers, procurement of books and learning tools, improvement of educational infrastructure, One of the things that causes school achievement and the quality of graduates to decline is the leadership of school principals who are less successful, and teacher achievement motivation has not been maximized due to a lack of willingness and sincerity in teacher performance, so there are still teachers who are not disciplined in carrying out their duties. Because the quality of learning in every school is very important for children, in the school itself the quality of education still has to be improved again with the new curriculum. Because the quality of an educational institution that runs without adhering to the goal will be difficult to achieve what is expected (Kubaev, 2020). To improve the quality of learning, schools must always adhere to the goal so that they are able to produce quality and highly competitive outputs. If this can be realized, efforts to improve the quality of human resources through education can become a reality that illustrates the enormous contribution of education. In this case, it requires efforts from education stakeholders so that improving the quality of education through quality and quality education and learning processes is in accordance with educational expectations (Asif, Awan, Khan, & Ahmad, 2013).

RESEARCH METHOD

This research was conducted in SMPN in Kota Selatan District, Gorontalo City. The determination of the research location is based on several reasons that the object is in accordance with the research objectives and the taking of the research location is expected to facilitate data collection, can minimize the use of time and costs required (Olii & Abdul, 2021).

This study uses a quantitative correlational approach, because this study seeks to find out how big the relationship between Principal Transformational Leadership Behavior and Teacher Achievement Motivation is with the Quality of Learning in SMPN in Kota Selatan District, Gorontalo City. The population of teachers in this study amounted to 174 teachers. The sampling technique in this study used a random sample (Random Sampling) using the formula from Taro Yamane and Slovin. Based on the calculation of a sample of 10% of the population, the sample used in this study was 64 employees who represented the population in researching the Relationship between Principal Transformational Leadership Behavior and Teacher Achievement Motivation with Learning Quality in Junior High Schools in Kota Selatan District, Gorontalo City.

RESULT AND DISCUSSION

1. Learning Quality (Y)

The quality of learning is a system which is a combination of the process and learning outcomes achieved by students to achieve the goals of educational quality standards (Miller, 2016). The frequency distribution is presented in the following table: Learning Quality Data was collected through a questionnaire spread over 25 statement items, obtained from
The Relationship of Transformational Leadership Behavior of School Principles and Teacher Achievement Motivation with Learning Quality

30 teachers (respondents) as the research sample. Based on the data scores, the distribution of data is then presented which includes: (a) data range, (b) class length, (c) interval class, and (d) frequency distribution. It is obtained that the range \( R = 30 \), the interval class \( K = 7 \), and the length of the interval class \( P = 5 \).

Interval class 85-89 with a frequency of 22 people while the lowest is the interval class 70-74 and 100-104 with 1 person. This can be illustrated in the following figure:

![Figure 4.1 Graph of Learning Quality Frequency Distribution (Y)](image)

2. Principal Transformational Leadership Behavior (X1)

Transformational leadership is the ability of a leader to coordinate, direct, and influence other people or followers to achieve organizational goals in order to achieve meaningful goals in accordance with predetermined achievement targets.

The principal's transformational leadership behavior data was collected through a questionnaire distributed in 25 statements obtained from 30 teachers (respondents) as the research sample.

Based on the data scores, the distribution of data is then presented which includes (a) data range, (b) class length, (c) interval class, and (d) frequency distribution. The obtained range \( R = 30 \), class interval \( K = 7 \), and length of class interval \( P = 5 \). Furthermore, it is presented in the frequency distribution table of Principal Transformational Leadership Behavior data.

The largest frequency is in the interval class 110-114 with a frequency of 16 people while the lowest is the interval class 90-94 with 1 person. This can be illustrated in the following figure:
3. Teacher Achievement Motivation (X2)

Teacher achievement motivation is an encouragement that comes from within a teacher to excel and be willing to take responsibility, dare to take calculated risks for individual performance that can improve the quality of learning.

Teacher achievement motivation data was collected through a questionnaire spread over 23 statements obtained from 30 teachers (respondents) as the research sample. Based on the data scores, the distribution of data is then presented which includes (a) data range, (b) class length, (c) interval class, and (d) frequency distribution. The obtained range (R) = 35, class interval (K) = 7, and length of class interval (P) = 5. Furthermore, it is presented in the frequency distribution table for achievement motivation data. The largest frequency is in the 80-84 interval class with a frequency of 16 people while the lowest is the 60-64 interval class with 2 people. This can be illustrated in the following figure:

Figure 4.3 Graph of the Frequency Distribution of Teacher Achievement Motivation (X2)
1) Relationship between Principal Transformational Leadership Behavior and Learning Quality (X1 to Y)

The results of the above analysis show that the value of the r-count correlation coefficient for the principal's transformational leadership behavior variable is 0.327, while the r-table value at the 5% significance level and the degree of freedom n-2=64-2=62 is 0.254. If these two values are compared, the r-count value is still greater than the r-table value (0.327 > 0.254). In testing the significance of the correlation coefficient, it turns out that the value of t-count is greater than t-list (t-count > t-list = 2.729 > 1.999) or the price of t-count is outside the acceptance of H0. So it can be concluded that the correlation above is really significant. Thus the hypothesis which says that there is a relationship between the principal's transformational leadership and the quality of learning is accepted.

So it can be concluded that at the 95% confidence level, it can be concluded that there is a significant relationship between the principal's transformational leadership behavior and the quality of learning. The following is an overview of the acceptance and rejection curves of the research alternative hypotheses:

Based on the results of the analysis of the coefficients on the count and the table above shows the magnitude of the correlation coefficient, which is 0.327 or in other words, the relationship between the independent variable and the dependent variable is 11%. So it can be said that the principal's transformational leadership variable has a relationship with the learning quality variable.

2). Relationship between Teacher Achievement Motivation and Learning Quality (X2 with Y)

The results of the above analysis show that the value of the r-count correlation coefficient for the teacher's achievement motivation variable is 0.579, while the r-table value at the 5% significance level and the degree of freedom n-2=64-2=62 is 0.254. If these two values are compared, the r-count value is still greater than the r-table value (0.579 > 0.254). In the test of the significance of the correlation coefficient, it turns out that the price of t-count is greater than t-list (tcount > t-list = 5.587 < 1.999) or the price of t-count is outside the acceptance of H0. So it can be concluded that the correlation above is really significant. Thus the hypothesis which says that there is a relationship between teacher achievement motivation and learning quality is accepted.

So it can be concluded that at the 95% confidence level, it can be concluded that there is a significant relationship between teacher achievement motivation and learning quality.

3). Relationship between Transformational Leadership Behavior and Achievement Motivation (X1 to X2)

The results of the above analysis show that the value of the r-count correlation coefficient for the principal transformational leadership behavior variable and teacher achievement motivation is 0.447 while the r-table value at the 5% significance level and the degree of freedom n-2=64-2=62 is 0.254. If these two values are compared, the r-count value is greater than the r-table value (0.447 > 0.254). In testing the significance of the correlation coefficient, it turns out that the value of t-count is greater than t-list (t-count > t-list = 3.935 > 1.999) or the price of t-count has been outside the acceptance of H0. So it can be concluded that the correlation above is really significant. Thus the hypothesis which says that there is a relationship between principals' transformational leadership and teacher achievement motivation is accepted.

So it can be concluded that at the 95% confidence level there is a significant relationship between the principal's transformational leadership and teacher achievement motivation.
1. Relationship between Principal Transformational Leadership Behavior and Quality of Learning in SMPNs in South City District, Gorontalo City

According to Danim (2008: 54) suggests that transformational leadership is the ability of a leader to work with and/or through other people to optimally transform organizational resources in order to achieve meaningful goals in accordance with predetermined achievement targets.

This means that the principal's transformational leadership is the principal's way of utilizing existing resources in the school in achieving the goals that have been set. The results of this study indicate that the value of the $r$-count correlation coefficient for the principal transformational leadership variable is 0.327, while the $r$-table value at the 5% significance level and the degrees of freedom $n-2=64-2=62$ is 0.254. If these two values are compared, the $r$-count value is greater than the $r$-table value ($0.327 > 0.254$). In testing the significance of the correlation coefficient, it turns out that the price of $t$-count is greater than $t$-list ($t$-count > $t$-list = 2.729 > 1.999) or the price of $t$-count has been outside the acceptance of $H_0$. So it can be concluded that the correlation above is really significant. Thus the hypothesis which says that there is a relationship between the principal's transformational leadership behavior and the quality of learning is accepted. So it can be concluded that at the 95% confidence level there is a significant relationship between the school's transformational leadership behavior and the quality of learning. Based on the calculation results show that transformational leadership has a positive relationship with the quality of learning that is equal to 0.10725, in other words the relationship between transformational leadership of school principals and learning quality is 11%. So it can be said that the principal's transformational leadership has a relationship with the quality of learning.

These findings indicate that the transformational leadership of principals at SMPNs in the South City District of Gorontalo City has a relationship or relationship with the quality of learning. So there needs to be improvements and improvements made by school principals in the South City District of Gorontalo City in carrying out their leadership, so that they can have an impact on the quality of existing learning. Where if a school principal can carry out his leadership well, it can directly have a significant influence on teacher performance so that it can provide an increase in the quality of learning.

2. The Relationship between Teacher Achievement Motivation and Learning Quality at SMPNs in South City District, Gorontalo City

According to Santrok (2003:474) Achievement motivation is the desire to get something done to achieve a standard of success, and to make an effort to achieve success.

This means that the teacher's achievement motivation is the desire of a teacher in carrying out his duties in achieving the goals of the school, namely an effective and efficient learning process. Where if a teacher has high achievement motivation, his performance will increase and will have a good impact on the quality of learning in schools.

The results of this study indicate that the value of the $r$-count correlation coefficient for the teacher achievement motivation variable is 0.579 while the $r$-table value at the 5% significance level and the degree of freedom $n-2=64-2=62$ is 0.254. If these two values are compared, the $r$-count value is greater than the $r$-table value ($0.579 > 0.254$). In testing the significance of the correlation coefficient, it turns out that the value of $t$-count is greater than $t$-list ($t$-count > $t$-list = 5.587 > 1.999) or the price of $t$-count has been outside the acceptance of $H_0$. So it can be concluded that the correlation above is really significant. Thus the hypothesis which says that there is a relationship between teacher achievement motivation and learning quality is accepted. So it can be concluded that at the 95% confidence level there is no significant relationship between teacher achievement
motivation and learning quality. Based on the calculation results show that the achievement motivation of teachers has a very close relationship with the quality of learning that is equal to 0.34, in other words the relationship between teacher achievement motivation and learning quality is 34%. So it can be said that the teacher's achievement motivation has a relationship with the quality of learning.

The results of these findings indicate that the achievement motivation of teachers at SMPN in the South City District of Gorontalo City based on the test results has a relationship or relationship with the quality of learning. So it is necessary to increase teacher achievement motivation as a whole at SMPN Kota Selatan in order to improve the learning process carried out in order to realize the quality of the graduation of existing students. Teachers should have motivation in order to improve their performance in teaching, because if a teacher has motivation, he will increase his competence, knowledge and expertise.

3. Relationship between Principal Transformational Leadership Behavior and Teacher Achievement Motivation with Learning Quality at SMPNs in South City District, Gorontalo City

According to Suhadi, et al. (2014:48), the quality of learning is a combination of the process and learning outcomes achieved by students with the support of educators and other education personnel. Learning is said to be of quality if all elements including students, educators, and education staff are able to show their best performance in carrying out their duties and responsibilities.

The quality of learning referred to in this study is the quality of learning in SMPN in the South City District of Gorontalo City. The achievement of the quality of learning can be used as the basis for the performance of principals and teachers at SMPN in the South City District of Gorontalo City. Because basically the purpose of the learning process is the achievement of the quality of learning. Based on the initial observations made by the researcher that the factors related to the quality of learning are the principal's transformational leadership and the teacher's achievement motivation. Where is the leadership of the principal who directs and motivates his employees, namely the teachers to be able to improve their performance in supporting the achievement of learning quality. Teachers play an important role in supporting the quality of learning, where teachers as educators must be able to provide lessons that are easily understood and understood by students as a whole.

Based on the results of the analysis of simultaneous correlation calculations, it was found that the calculated r value was 0.5838, or in other words, the relationship between the independent variable and the dependent variable was 58.38%, so it can be said that the transformational leadership variable of the principal and the teacher's achievement motivation has a close relationship with the quality of learning.

Then it can be seen from the test significance test results that the calculated F value is 15.7678. Meanwhile, the F table value in this test is obtained from the formula df1 = k-1 and df2 = n-k and the results are df1 = 2 and df2 = 61. So the Ftable value is 3.15. If the two rho values are compared, the Fcount value is greater than the Ftable value (15.7678 > 3.15). Thus, the hypothesis which states that there is a relationship between the principal's transformational leadership and teacher achievement motivation with learning quality is accepted.

These findings indicate that the principal's transformational leadership behavior and teacher achievement motivation simultaneously have a positive and significant relationship with the quality of learning in junior high schools throughout the South City District of Gorontalo City.
CONCLUSION

Based on the results of the research that has been carried out, it can be concluded that each variable is as follows: There is a positive relationship between the principal's transformational leadership behavior and the quality of learning in SMPNs throughout the South City District of Gorontalo City. From the results of testing the principal's transformational leadership variable, the criteria are very good. There is a positive relationship between the teacher's achievement motivation and the quality of learning in SMPN in the South City District of Gorontalo City. From the results of testing the teacher's achievement motivation variable, the criteria are very good. There is a jointly positive relationship between the principal's transformational leadership behavior and the teacher's achievement motivation with the quality of learning at SMPNs throughout the South City District of Gorontalo City. From the results of testing the learning quality variables are in very good criteria.
