SESSION 2050 (SYMPOSIUM)

ENGAGING METHOD AND ANALYSIS TO DISCOVER AND REIMAGINE POSSIBILITIES FOR INDIVIDUALS AGING WITH AND INTO DISABILITY
Chair: Kelly Munly Co-Chair: Ted Ng Discussant: Lieke van Heumen

This symposium engages diverse methods and analyses to discover and reimagine possibilities for individuals aging with and into disability. The presentations advance an understanding of the diversity of service/care needs as well as social capital, with exploration into assistive technologies, educational attainment, and assessment of successful aging. In the first presentation, the authors delineate key informant interview data identifying capacity-building needs in professional skills, organizational operations, service/care models, and public policies to effectively serve older adults aging with and into disability. The second presentation offers a content analysis of how researchers conceptualize, measure, and apply social capital to developmental disability throughout the life course, reviewing peer-reviewed articles from 5 disciplines, across more than 20 years. In the third presentation, using National Health and Aging Trends Study data, the authors investigate the longitudinal associations between disabilities, assistive technologies, and subjective well-being among older adults. In the fourth presentation, the author uses multivariate regression analysis to analyze National Health Interview Survey (NHIS) data, building on prior research analyzing the association between educational attainment and the perceived need for future help with activities of daily living (ADLs), often measuring disability in the literature. In the fifth and final presentation, the authors use the National Health & Aging Trends Study data to understand successful aging from the perspectives of those who experience disability, integrating subjective components of self-rated health and well-being, and providing insights on subjective perceptions on successful aging among older adults with disabilities.

INCREASING SOCIAL CARE CAPACITY TO MEET THE NEEDS OF PERSONS AGING WITH DISABILITY
Michelle Putnam1, Lieke van Heumen2, Lydia Odgen1, Caitlyn Coyle3, and Kerri Morgan4, 1. Simmons University, Boston, Massachusetts, United States, 2. University of Illinois at Chicago, Chicago, Illinois, United States, 3. University of Massachusetts, Boston, Boston, Massachusetts, United States, 4. Washington University School of Medicine in St. Louis, St. Louis, Missouri, United States

This national study presents key informant interview data (N=28) collected 2017-2018 identifying capacity building needs in professional skills, organizational operations, service/care models, and public policies to effectively serve older adults with long-term serious mental illness, intellectual/developmental disabilities, physical and sensory disabilities. A multi-university, interdisciplinary team collected data through phone interviews, coded, and analyzed transcripts thematically and using content analysis. Key informants worked in national affinity organizations, state-level organizations, academia, and social care organizations. Findings are broad in scope, highlighting variances in rural/urban areas, state government dispositions, workforce characteristics, social and health care infrastructure, beliefs about disability and chronic conditions, and other factors. Findings will informed the development of a larger survey study aiming to articulate an agenda for building capacity to meet the needs of aging with disability populations.

THAT’S WHAT FRIENDS ARE FOR: SOCIAL CAPITAL, DEVELOPMENTAL DISABILITY, AND THE LIFE COURSE
Jessica Hoyle, Jan Warren-Findlow, Lauren Wallace, James Laditka, and Sarah Laditka, University of North Carolina at Charlotte, Charlotte, North Carolina, United States

Social capital, resources from reciprocal relationships, helps us get by as we age. People with developmental disability have service needs that persist across the life course, which social capital can help address. However, social structures, communication problems and smaller social networks limit social capital for some people with developmental disability. We studied how researchers conceptualize, measure, and apply social capital to developmental disability research throughout the life course, reviewing peer-reviewed articles across 5 disciplines, from 2000 through February 2022. Of 673 studies, 71 met criteria. Studies used a common definition of social capital but no common measures. Fourteen studies focused on parents or other caregivers. Few included older adults with developmental disability as research participants. Results indicate a need to better understand social capital in the lives of people with developmental disability and how social capital resources can support and improve lives of people with developmental disability as they age.

USING ASSISTIVE TECHNOLOGIES AS A MEASURE TO SUPPORT WELL-BEING IN LATE-LIFE DISABILITIES
Tai-Te Su1, and Shannon Mejia2, 1. The University of Illinois Urbana-Champaign, Champaign, Illinois, United States, 2. University of Illinois at Urbana-Champaign, Champaign, Illinois, United States

In the United States, the trends of disabilities among older adults have been largely stable over the past decade. However, the impact of disabilities on health and quality of life remains substantial and requires continued research.
Along with a set of compensatory strategies, assistive technologies play a promising role in augmenting individuals’ capacity and reducing environmental demands in daily activities. Using data from the five survey rounds of the National Health and Aging Trends Study (2015–2019), we aimed to investigate the longitudinal associations between disabilities, assistive technologies, and subjective well-being among older adults. A multi-class hierarchical spectrum was constructed to capture the state of disability and assistive technology use. Overall, results showed that subjective well-being decreased progressively along the spectrum. Additionally, assistive technologies were found to differentiate the associations between disabilities and well-being outcomes. Discussions focused on the insights and implications for successful accommodation to disabilities in later life.

EDUCATION AND PERCEIVED FUTURE NEED FOR ADL HELP
Julia Finan, Syracuse University, Syracuse, New York, United States

Extant literature suggests that adults with higher education are more likely to avoid poor health outcomes and to rate their health as better than individuals with less education. The current study builds on prior research by analyzing the association between educational attainment and the perceived need for future help with activities of daily living (ADLs), often measuring disability in the literature. 2011-2014 National Health Interview Survey (NHIS) data for adults in the United States age 40 to 65 (N=55,166) were analyzed using multivariate regression analysis. Among non-Hispanic Whites, increased years of education predicted stronger anticipation of the need for future ADL assistance. For non-Hispanic Blacks, this relationship was reversed at the same-college level. Education was not predictive of perceived future ADL assistance need for all other racial-ethnic groups. Results of this study suggest education has a unique impact on anticipation of future need for ADL assistance among non-Hispanic Whites.

CONCEPTUALIZING SUCCESSFUL AGING IN THE PRESENCE OF DISABILITY
Madina Khamzina, and Wendy Rogers, University of Illinois Urbana Champaign, Champaign, Illinois, United States

With the rapid demographic changes, it is predicted that every fifth person in the U.S. will be age 65 or older in the next decade. The quality of life and successful aging of older adults, who now live longer, is an important research area from societal and public health perspectives. Rowe and Kahn (1997) defined successful aging as having a low probability of disease and disability, high cognitive and physical functioning, and active engagement with life. A prominent limitation of this model is that it initially neglects essential components of aging and factors that are beyond an individual’s choice and control, such as health declines and disabilities. We used the National Health & Aging Trends Study data to understand successful aging from the perspectives of those who experience disability integrating subjective components of self-rated health and well-being. These data provide insights on subjective perceptions on successful aging among older adults with disabilities.

SESSION 2060 (SYMPOSIUM)

ENSURING A KNOWLEDGEABLE GERIATRIC WORKFORCE: INTERDISCIPLINARY EDUCATION IN LONG-TERM SERVICES AND SUPPORTS
Chair: Gina Tucker-Roghi Co-Chair: Gail Towsley
Discussant: Linda Edelman

In this symposium, we describe five interdisciplinary educational programs to enhance the geriatric workforce in long-term services and supports (LTSS): Skilled nursing facilities (SNFs), assisted living, and home health and hospice. The interdisciplinary teams that came together to offer the programs leveraged technology to maximize access to experts in both the curriculum development process and the delivery of the educational programs for a wide range of target learners. The first program, an interdisciplinary telementoring series on dementia care for therapists in SNFs, was developed by a team of experts from occupational, physical and speech therapy. The program included asynchronous online didactic content and case-based learning relevant to therapists. The second program engaged faculty from seven graduate programs: Pharmacy, Physical Therapy, Occupational Therapy, Dentistry, Social Work, Nursing and Physician Assistant to co-create an interprofessional LTSS graduate certificate in Gerontology. The certificate encompasses asynchronous online courses to enable flexibility across programs and cover content specific to LTSS. In the third program, LTSS nurses completed an online educational course to better prepare them to care for complex older adults, improve leadership skills, become more resilient, and complete QAPI projects. The fourth program focused on utilizing interdisciplinary perspectives to educate LTSS direct care staff on the unique needs of LGBTQ older adults. The fifth program offered a virtual telehealth clinical experience to prepare physical therapy students for practice in a SNF setting. The curriculum included eight virtual modules and four telehealth patient encounters that exposed students to interdisciplinary teams in the SNF context.

INTERDISCIPLINARY TELEMENTORING FOR THERAPISTS IN SNFS TO IMPROVE DEMENTIA CARE KNOWLEDGE AND SKILLS
Gina Tucker-Roghi, Dominican University of California, Santa Rosa, California, United States

Occupational, physical, and speech therapists possess knowledge and skills that have the potential to reduce the burden of care and improve the quality of life of skilled nursing facility (SNF) residents living with dementia. Despite this opportunity to impact the well-being of residents with dementia, many therapy practitioners lack specialized training in the management of dementia. Therapy practitioners (n=31) from 22 SNFs participated in eight weekly interdisciplinary educational sessions using the Project ECHO (Extension for Community Health Outcomes) tele-mentoring model. An interdisciplinary team of therapy experts collaborated on the development of the curriculum, which included didactic content on dementia-care best practices as well as case-based learning. This presentation describes the process of developing an interprofessional tele-mentoring therapy education.
