Abstract
Eight genera and 13 species of the tribe Acanthocerini are recorded in Argentina, i.e., Athaumastus haematicus (Stål), A. macer Brailovsky, A. subcarinatus (Stål), A. subterlineatus Bergroth, Beutelspacoris sanchexi Brailovsky, B. dilatata Casini, Camptischium clavipes (Fabricius), Crinocerus sanctus (Fabricius), Dersagrena flaviventris (Berg), D. lacerdae (Signoret), D. subfoveolata (Berg), Thlastocoris hernandezi Brailovsky and Zoreva dentipes Fabricius. Redescriptions are given for A. haematicus, A. subcarinatus and D. flaviventris with photographs of male and female genitalia of D. subfoveolata. Zoreva recorded from Argentina the first time. New locality records are given for Buenos Aires, Chaco, Formosa, Misiones, and Tucumán.

Acanthocerini, genera, Argentina, key, redescription, distribution
Introduction

The Coreidae, commonly called “leaf-footed, pod- or squash-bugs”, are heavy bodied insects usually strongly elongate or broadly elliptical. This family includes some of the largest living heteropterans, as well as species that are delicate or slender (Schuh & Slater 1995). The family contains about 267 genera and more than 1884 species worldwide (Henry 2009). The basic suprageneric classification was established by Stål (1867, 1870) and Schaefer (1964, 1965), who provided the most comprehensive treatment. Packauskas (1994) gave keys to the subfamilies and tribes of the New World Coreidae and a checklist of published keys to genera and species, and Packauskas (2010) cataloged the New World Coreidae and provided a comprehensive introduction to the literature.

The most comprehensive treatment of the Coreidae for Argentina are by Pennington (1920, 1921) and Kormilev (1954), but only Pennington (1921) dealt with the Acanthocerini.

Many coreids are of great economic importance. As mentioned by Mitchell (2000), grains legumes, rice, cassava, cucurbits, tomatoes, garden vegetables, and various fruit and nut trees are among the crops attacked by coreids worldwide. According to Mitchell (2000), the Acanthocerini includes species of minor economic importance, i.e., *Athaumastus haematicus* (Stål) that attacks potatoes, cotton, sunflower, oranges and eggplant, *Dersagrena flaviventris* (Berg) on cotton, and *Camptischium clavipes* (F.) on castor bean and guaco (Bosq 1937, 1940; Mitchell 2000).

Knowledge of the South American fauna is poor; this is especially true in regard to economically important taxa. Comprehensive keys for identification of the species in the region have not been published.

Most of Argentina lies in the Neotropical faunal region. The country covers an area of 2,791,810 km² and is bordered by Uruguay, Brazil, Paraguay, Bolivia, and Chile. Approximately 75% of the country is occupied by arid and semiarid areas, but rainforests are also present in the northeast, i.e., the Yungas and Paranaense regions. Coscarón (submitted) recorded 125 species in 48 genera of Coreidae living from Argentina.

The goal of this paper is to provide an illustrated key to the genera of Acanthocerini (Coreidae) from Argentina (Fig. 38), a diagnosis and redescription of some of its species, geographical distribution, and a list of species for each genus.

Materials and methods

All specimens from this study are deposited in the collections of the Museo de Ciencias Naturales de La Plata (MLP), La Plata, Buenos Aires, Argentina (http://www.fcnym.unlp.edu.ar/abamuse.html). Photographs were compared with material of the Naturhistoriska Riksmuseet in Stockholm, Sweden (http://www.nrm.se/2.1286b10fdbe80efba80001.html) and the American Museum of Natural History in New York (http://www.amnh.org/). For the geographical distribution we used the program DIVA-GIS 7.1.7 (http://www.diva-gis.org/) and the distribution of those specimens for which global positioning
system data were available was used for the construction of maps. Photographs were produced using a Kodak Easy Share (12 megapixels) camera and a magnifying Wild M-Stereo microscope. The diagnoses of genera are taken from Brailovsky (1987) and O’Shea (1980), except as noted. Coreoidea Species File (Version 1.1/4.1) (http://coreoidea.speciesfile.org/HomePage.aspx) was consulted. All measurement are in millimeters.

Key to the genera of Acanthocerini for Argentina

1a Pronotum slightly declivent (Fig. 31) .......................................................... 2
1b Pronotum not slightly declivent .................................................................. Thlastocoris Mayr

Taxonomy

Genus Athaumastus Mayr
http://species-id.net/wiki/Athaumastus
http://coreoidea.speciesfile.org/Common/basic/Taxa.aspx?TaxonNameID=759
Figs 1, 6

Athaumastus Mayr 1865: 431. Type species: Crinocerus lugens Stål 1855: 184; monotypic.

Diagnosis. (After O’Shea 1980) Body medium-sized, robust, postocular tubercles well developed; antennifers large, placed close together, projecting anteriorly of tylus, with well developed spine on lateral surface; pronotum not very steeply declivent, lateral margins slightly nodulose, humeral angles rounded-angulate, posthumeral, posterior margins relatively smooth; anterior femora with or without distal spines on ventral surface, intermediate and posterior femora armed at least with small apical spines, posterior
femora markedly curved, incrassate, especially in male; posterior tibiae flattened, armed with teeth along ventral margin, with large tooth halfway along ventral margin in male.

*Athaumastus haematicus* (Stål)

**Redescription.** Male. n= 8. Total body length: 12.3-14.2; head length 1.0-1.2; head width 1.4-0.18; eye width 0.2-0.3; interocular space 0.8-0.9; preocellar distance 0.4; interocellar space 0.2. Rostrum: I 0.7-0.8, II 1.2, III 1.0, IV 0.64-0.7. Antennal seg-
Synopsis of Acanthocerini (Hemiptera, Coreidae) from Argentina

Measurements: I 1.8-2.1, II 1.3-2.2, III 2.2-2.7 and IV 1.4-2.0. Pronotum length 2.3-2.9; width 4.6-6.4. Scutellum length 2.3, width 2.2. Length of abdomen with hemelytra: 8.6-9.8; length abdomen with hemelytra: 9.0-10.0; Abdomen width: 3.9-4.6. Dorsal coloration: Head brown tinged with red except antennal segments 2-3, bases of segments with brown tonalities. Pronotum brown, tinged with red. Scutellum dark brown. Corium and clavus brown, tinged with red and hemelytral membrane dark brown, veins light brown. Connexival segments dark brown, tinged with red. Ventral coloration: Ground color light brown, tinged with red, mesosternum darker and abdomen not homogeneously dark pigmented. Legs dark brown, tinged with red. Structure: Pronotum rugose. Frontal angles rugose projecting with in as acute projecting spines, humeral angles with two rounded projections. Scutellum granulate. Metafemora with two rows of spines, tibia with small teeth basally. Hemelytra shorter than the abdomen.

Female. n=8. Total body length: 12.0-13.5; head length: 10.0; head width: 1.4-1.6; eye width: 0.2-0.3; interocular space: 0.8-0.9; preocellar distance: 0.4; interocellar space: 0.3. Rostrum: I 0.6-0.8, II 1.2, III 0.9, IV 0.7. Antennal segments: I 1.1-1.7, II 1.5-1.6, III 1.9-20.0 and IV 1.2-1.5. Pronotal length: 2.2-2.7; width: 4.2-5.0. Scutellar length: 1.7; width: 1.5. Length of abdomen with hemelytra: 9.0-11.0; length of abdomen without hemelytra: 9.6-11.3; abdomen width: 4.7-5.4. Dorsally and ventrally light brown. Anterior angles granulate; humeral angles with two rounded projections.

Specimens examined. Argentina: Catamarca: 1♂ Andalgalá (27°36'02"S, 66°18'56"W), 1♂ Pomán (28°23'44.38"S, 66°13'06.91"W). Córdoba: 2♀ Cabaña (31°13'00.56"S, 64°22'00.32"W), 1♂ Makena (31°21'52.69"S, 64°10'18.54"W), 3♀ 2♂ Marull (30°59’43.72"S, 62°49’38.55"W), 1♂ Mar Chiquita (30°48’35.46"S, 62°52’31.68"W), 1♂ Rayo cortado (30°04’26.09"S, 63°49’25.99"W). 2♀ 3♂ Corrientes. Chaco: 1♀ Charata (27°13’06.31"S, 61°11’15.89"W), 1♀ El zapallar (26°32’17.85"S, 59°20’42.57"W), 8♀ 7♂ Gancedo (27°29’21.89"S, 61°40’31.52"W), 1♀ Resistencia (27°27’05"S, 58°59’10"W). Formosa: 2♂ Ingeniero Juárez (23°53’46.85"S, 61°51’37.88"W). 1♂ La Rioja. 1♀ San Luis. Santiago del Estero: 1♂ Río Salado (27°44’32.51"S, 64°21’16.97"W).

Distribution. Argentina: Buenos Aires; Catamarca; Córdoba: Carlos Paz, El Sauce, San Javier; Corrientes: Alvear Department, Bella Vista Department, Berón de Astrada Department, Capital Department, Colón Department, Concepción Department, Concordia Department, Diamante Department, Empeadero Department, Esquina Department, General Paz Department, La Paz Department, Mburucuyá Department, Paraná Department, Paso de los Libres Department, Saladas Department, San Martín Department, San Miguel Department, San Roque Department, Santo Tomé Department, Victoria Department; Chaco; Entre Ríos: Concordia; Formosa; Jujuy; La Pampa; La Rioja; Mendoza; Misiones: Alem Department, Apóstoles Department, Cainguás Department, Concepción de la Sierra Department, Guarani Department, Montecarlo Department, Oberá Department, San Javier Department, San Martín Department, 25 de Mayo Department; Neuquén; Salta; San Juan; San Luis: San Gerónimo, Suyuque; Santa Fé; Santiago del Estero; Tucumán.
**Athaumastus macer** Brailovsky 1993:115.

**Distribution.** Argentina: Tucumán

**Athaumastus subcarinatus** (Stål) 1859: 455.

**Athaumastus subfoveolatus** Berg 1892: 66.–Coscarón 1998: 4.
**Athaumastus subcarinatus** Pennington 1920: 13.– Pennington 1921: 38.– Quintanilla et al. 1968: 31.– Quintanilla et al. 1976: 118.Viana and Williner 1978: 74.

**Redescription.** Male: n=8. Total body length: 12.4-13.0; head length: 0.8-1.1; head width: 1.4-1.5; eye width: 0.2-0.3; interocular space: 0.8; preocellar distance: 0.3; interocellar space: 0.2. Rostrum: I 0.4-0.7, II 1.1, III 0.7, IV 0.4-0.6. Antennal segments: I 1.3-1.7, II 1.5-1.9, III 1.4-2.1 and IV 1.3. Pronotum length: 2.2-2.7; width: 3.4-3.9. Scutellum length: 1.4, wide 1.6. Length of abdomen with hemelytra: 8.0; length of abdomen with hemelytra: 9.0; abdomen width: 4.0-4.1. Dorsal coloration: Head including antennal segments 1-3 brown, 4 dark brown. Pronotum brown, margins light brown. Scutellum and corium brown tinged with dark red, hemelytral membrane dark brown. Connexival segments light brown. Ventral coloration: Ground color brown with following areas dark brown: mesosternum, metapleura, and abdomen not homogeneously dark brown. Fore- and middle legs light brown, hind leg dark brown. Structure: head granulate brown; antennal segment IV pilose; pronotum granulate. Frontal angles rugose, with a projecting as acute spines; humeral angles with two rounded projections. Scutellum granulate, dark brown. Metafemora with two rows of 6 spines; tibia with small teeth basally. Hemelytra granulated brown tinged with dark red, shorter than abdomen.

**Specimens examined.** Argentina: Buenos Aires: 1 ♀ Junín (34°35’16.37”S, 60°58’45.71”W). Córdoba: 1 ♀ Villa Nueva (32°26’08.91”S, 63°14’59.39”W). Formosa: 1 ♀ Almirante Brown (24°47’56.53”S, 60°27’58.83”W). Misiones: 1 ♀ 1 ♂ Loreto (27°18’59.85”S, 55°32’00.04”W).

**Distribution.** Córdoba: Carlos Paz, San Javier; Corrientes: Capital Department, Lavalle Department; Entre Ríos: Concordia Department, Federación Department, Gualeguachú Department, Paraná Department, Villaguay Department; Salta.

**Remarks.** These are the first records of this species from Buenos Aires, Formosa, and Misiones.
Synopsis of Acanthocerini (Hemiptera, Coreidae) from Argentina

Athaumastus subterlineatus Bergroth
http://coreoidea.speciesfile.org/Common/basic/Taxa.aspx?TaxonNameID=785

Athaumastus subterlineatus Bergroth 1912: 85

Distribution. Argentina: Santiago del Estero, Río Salado.

Genus Beutelspacoris Brailovsky
http://species-id.net/wiki/Beutelspacoris
http://coreoidea.speciesfile.org/Common/basic/Taxa.aspx?TaxonNameID=760

Beutelspacoris Brailovsky 1987: 523. Type species: Beutelspacoris sanchezi Brailovsky 1987: 524.
Moreyacoris Casini 1989: 25. Type species: Moreyacoris dilatata Casini 1989: 26.

Diagnosis. (After Brailovsky 1987) Body relatively small, robust, postocular tubercles prominent; antenniferous tubercles large. Pronotum slightly declivent, wider than long; callar region distinct; collar narrow; humeral angles rounded. All femora at least slightly incrassate; posterior femora more incrassate; all femora with subdistal spines on ventral surface and dorsally smooth; anterior and intermediate tibiae terete, sulcate, and unarmed; posterior tibiae slightly flattened, armed with small teeth along internal margin.

Figures 11–14. Athaumastus subcarinatus (Stål) ♂. 12 dorsal view 12 ventral view 13 hind leg 14 male genital capsule, ventral view.

Fig. 29

*Zoreva* Amyot and Serville 1843: 216. Type species: *Coreus dentipes* Fabricius 1803: 196.

**Diagnosis.** (After O’Shea, 1980) Body narrow and elongated. Pronotum almost hexagonal, humeral angle developed into a long sharp spine of variable length and di-
rection, posthumeral edge with small conspicuous teeth, posterior border straight or slightly concave. Leg dimorphic. Males: Femora ventrally armed with spines of variable length, femur anterior generally smooth texture; hind femur swollen and curved. Females: Femora armed with spines ventrally, length variable anterior and middle femora thinner and a little more drawn back, but never curved.

Figure 38–41. Geographical distribution: 38 Argentina geographical location 39 Athaumastus haematicus (Stål) 40 Athaumastus subcarinatus (Stål) 41 Camptischium clavipes (Fabricius).
Figure 42–45. Geographical distribution: 42 *Crinocerus sanctus* (Fabricius), 43 *Dersagrena flaviventris* (Berg) 44 *Dersagrena subfoveolata* (Berg) 45 *Zoreva dentipes* Fabricius.

Coreus dentipes Fabricius 1803: 196.

Redescription. Holotype. Male. n=1. Total body length: 9.8; head length: 1.1; head width: 1.6; eye width: 0.3; interocular space: 0.7; preocellar distance: 0.2; interocellar space: 0.3. Rostrum: (missing). Antennal segments length: I 2.6, II 2.4, III 1.4, IV 1.8. Pronotal length: 1.8; width: 2.8. Scutellar length: 1.3; width 1.1. Length of abdomen with hemelytra: 8.5; length of abdomen with hemelytra: 8.4; abdomen width: 2.4. Dorsal coloration: Head light brown, except anterior region of ocelli and post ocular region dark brown, with many short hairs. Antennal segments 1-2 longer than 3-4, 4 longer than 3, segment 1-3 light brown, segment 4 dark brown except base, and segment 5 light brown. Pronotum are light brown except anterior margin dark brown. Scutellum brown except edges and posterior process dark brown. Connexival: two lateral segment light brown except lateral projection dark brown. Ventral coloration: light brown except area next to conexivum dark brown to brown, light brown not uniformy red. Legs: fore and middle femora dark brown, tarsi light brown with light brown spots. Mid femur with one spine distally. Fore femur dark brown with spines, basally very long, medially short and distally long. Structure: pronotum granulose; frontal angles granulose and projecting as acute spines reaching ocular tubercles; humeral angles with two rounded projections and shorter spines; scutellum granulose with pilosity. Hemelytra as long as the abdomen, brown with punctuations and pilosity, membrane dark brown.

Specimen examined. Argentina: Formosa: 1♂ Laguna Oca (26°13’56.25”S, 58°13’04.84”W).

Distribution. Argentina: Formosa: Laguna Oca.

Remarks. This is the first record of this species for Argentina.

Acknowledgments

We want to thank our gratitude anonymous reviewers for the critical reading of the manuscript; to Dr M. Griffin (University of La Plata, Argentina) for revising the english. This study was supported by Consejo Nacional de Investigaciones Científicas y Técnicas de Argentina (CONICET).
