Abstract
The Concise Guide to PHARMACOLOGY 2017/18 provides concise overviews of the key properties of nearly 1800 human drug targets with an emphasis on selective pharmacology (where available), plus links to an open access knowledgebase of drug targets and their ligands (www.guidetopharmacology.org), which provides more detailed views of target and ligand properties. Although the Concise Guide represents approximately 400 pages, the material presented is substantially reduced compared to information and links presented on the website. It provides a permanent, citable, point-in-time record that will survive database updates. The full contents of this section can be found at http://onlinelibrary.wiley.com/doi/10.1111/bph.13880/full. Nuclear hormone receptors are one of the eight major pharmacological targets into which the Guide is divided, with the others being: G protein-coupled receptors, ligand-gated ion channels, voltage-gated ion channels, other ion channels, catalytic receptors, enzymes and transporters. These are presented with nomenclature guidance and summary information on the best available pharmacological tools, alongside key references and suggestions for further reading. The landscape format of the Concise Guide is designed to facilitate comparison of related targets from material contemporary to mid-2017, and supersedes data presented in the 2015/16 and 2013/14 Concise Guides and previous Guides to Receptors and Channels. It is produced in close conjunction with the Nomenclature Committee of the Union of Basic and Clinical Pharmacology (NC-IUPHAR), therefore, providing official IUPHAR classification and nomenclature for human drug targets, where appropriate.

Conflict of interest
The authors state that there are no conflicts of interest to declare.

Overview: Nuclear receptors are specialised transcription factors with commonalities of sequence and structure, which bind as homo- or heterodimers to specific consensus sequences of DNA (response elements) in the promoter region of particular target genes. They regulate (either promoting or repressing) transcription of these target genes in response to a variety of endogenous ligands. Endogenous agonists are hydrophobic entities which, when bound to the receptor promote conformational changes in the receptor to allow recruitment (or dissociation) of protein partners, generating a large multiprotein complex. Two major subclasses of nuclear receptors with identified endogenous agonists can be identified: steroid and non-steroid hormone receptors. Steroid hormone receptors function typically as dimeric entities and are thought to be resident outside the nucleus in the unliganded state in a complex with chaperone proteins, which are liberated upon agonist binding. Migration to the nucleus and interaction with other regulators of gene transcription, including RNA polymerase, acetyltransferases and deacetylases, allows gene transcription to be regulated. Non-steroid hormone receptors typically exhibit a greater distribution in the nucleus in the unliganded state and interact with other nuclear receptors to form heterodimers, as well as with other regulators of gene transcription, leading to changes in gene transcription upon agonist binding. Selectivity of gene regulation is brought about through interaction of nuclear receptors with particular consensus sequences of DNA, which are arranged typically as repeats or inverted palindromes to allow accumulation of multiple transcription factors in the promoter regions of genes.

Nuclear hormone receptors | S208
### 1A. Thyroid hormone receptors

**Nuclear hormone receptors → 1A. Thyroid hormone receptors**

**Overview:** Thyroid hormone receptors (TRs, nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [41]) are nuclear hormone receptors of the NR1A family, with diverse roles regulating macronutrient metabolism, cognition and cardiovascular homeostasis. TRs are activated by thyroxine (T4) and thyroid hormone (triiodothyronine). Once activated by a ligand, the receptor acts as a transcription factor either as a monomer, homodimer or heterodimer with members of the retinoid X receptor family. NH-3 has been described as an antagonist at TRs with modest selectivity for TRβ [110].

| Nomenclature          | Thyroid hormone receptor-α | Thyroid hormone receptor-β |
|-----------------------|----------------------------|-----------------------------|
| Systematic nomenclature | NR1A1                      | NR1A2                       |
| HGNC, UniProt         | THRA, P10827               | THR8, P10828                |
| Rank order of potency | triiodothyronine > T4      | triiodothyronine > T4       |
| Agonists              | dextrothyroxine [19]        | dextrothyroxine [19]        |
| Selective agonists    | -                          | sobetirome [26, 130]        |

**Comments:** An interaction with integrin αVβ3 has been suggested to underlie plasma membrane localization of TRs and non-genomic signalling [8]. One splice variant, TRα2, lacks a functional DNA-binding domain and appears to act as a transcription suppressor. Although radioligand binding assays have been described for these receptors, the radioligands are not commercially available.

1B. Retinoic acid receptors

Overview: Retinoic acid receptors (nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [46]) are nuclear hormone receptors of the NR1B family activated by the vitamin A-derived agonists tretinoin (ATRA) and alitretinoin, and the RAR-selective synthetic agonists TTNPB and adapalene. BMS493 is a family-selective antagonist [47].

Nomenclature

| Retinoic acid receptor-α | Retinoic acid receptor-β | Retinoic acid receptor-γ |
|-------------------------|-------------------------|-------------------------|
| NR1B1                   | NR1B2                   | NR1B3                   |
| RARA, P10276            | RARB, P10826            | RARG, P13631            |
| tretinoin [25]          | tretinoin [25]          | tazarotene [25]         |
| tazarotene [25]         | tazarotene [25], adapalene [24] | AHPN [24] |
| BM5753 [53], tamiabarotene [146], Ro 40-6055 [33] | AC261066 [89], AC55649 [88, 89] | MM 11253 [76] |
| Ro 41-5253 (plC50 6.3–7.2) [2, 69] | – | – |

Comments: Ro 41-5253 has been suggested to be a PPARγ agonist [129]. LE135 is an antagonist with selectivity for RARα and RARβ compared with RARγ [84].

1C. Peroxisome proliferator-activated receptors

Overview: Peroxisome proliferator-activated receptors (PPARs, nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [101]) are nuclear hormone receptors of the NR1C family, with diverse roles regulating lipid homeostasis, cellular differentiation, proliferation and the immune response. PPARs have many potent endogenous agonists [13, 101], including 15-deoxy-Δ12,14-PGJ2, prostacyclin (PGI2), many fatty acids and their oxidation products, lysophosphatidic acid (LPA) [98], 13-HODE, 15S-HETE, Paz-PC, azelaoyl-PAF and leukotriene B4 (LTB4). Bezafibrate acts as a non-selective agonist for the PPAR family [155]. These receptors also bind hypolipidaemic drugs (PPARα) and anti-diabetic thiazolidinediones (PPARγ), as well as many non-steroidal anti-inflammatory drugs, such as sulindac and indomethacin. Once activated by a ligand, the receptor forms a heterodimer with members of the retinoid X receptor family and can act as a transcription factor. Although radioligand binding assays have been described for all three receptors, the radioligands are not commercially available. Commonly, receptor occupancy studies are conducted using fluorescent ligands and truncated forms of the receptor limited to the ligand binding domain.

Full Contents of ConciseGuide: http://onlinelibrary.wiley.com/doi/10.1111/bph.13880/full
### Peroxisome proliferator-activated receptor-α (PPARα)

| Systematic nomenclature | HGNC, UniProt | Selective agonists | Selective antagonists |
|-------------------------|--------------|--------------------|----------------------|
| NR1C1                   | PPARA, Q07869| GW7647 [17, 18], CP-775146 [67], pirinixic acid [155], gemfibrozil [31] | GW6471 (pIC\(_{50}\) 6.6) [158] |

**Comments:** As with the estrogen receptor antagonists, many agents show tissue-selective efficacy (e.g. [12, 109, 124]). Agonists with mixed activity at PPARα and PPARγ have also been described (e.g. [35, 52, 159]).

### Peroxisome proliferator-activated receptor-β (PPARβ/δ)

| Systematic nomenclature | HGNC, UniProt | Selective agonists | Selective antagonists |
|-------------------------|--------------|--------------------|----------------------|
| NR1C2                   | PPARD, Q03181| GW0742X [50, 148], GW501516 [112] | GSK0660 (pIC\(_{50}\) 6.5) [131] |

### Peroxisome proliferator-activated receptor-γ (PPARγ)

| Systematic nomenclature | HGNC, UniProt | Selective agonists | Selective antagonists |
|-------------------------|--------------|--------------------|----------------------|
| NR1C3                   | PPARG, P37231| GW1929 [17], bardoxolone (Partial agonist) [149], rosiglitazone [59, 80, 161], troglitazone [59, 161], pioglitazone [7, 59, 127, 161], ciglitazone [59] | T0070907 (pK\(_{i}\) 9) [77], GW9662 (Irreversible inhibition) (pIC\(_{50}\) 8.1) [78], CDDO-Me (pK\(_{i}\) 6.9) [149] |

### 1D. Rev-Erb receptors

**Overview:** Rev-erb receptors (nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [6]) have yet to be officially paired with an endogenous ligand, but are thought to be activated by heme.

| Nomenclature | Rev-Erb-α | Rev-Erb-β |
|--------------|-----------|-----------|
| Systematic nomenclature | NR1D1 | NR1D2 |
| HGNC, UniProt | NR1D1, P20393 | NR1D2, Q14995 |
| Endogenous agonists | heme [121, 160] | heme [97, 121, 160] |
| Selective agonists | GSK4112 [51], GSK4112 [70] | – |
| Selective antagonists | SR8278 (pIC\(_{50}\) 6.5) [70] | – |

1F. Retinoic acid-related orphans

Nuclear hormone receptors → 1F. Retinoic acid-related orphans

**Overview:** Retinoic acid receptor-related orphan receptors (ROR, nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [6]) have yet to be assigned a definitive endogenous ligand, although RORα may be synthesized with a ‘captured’ agonist such as cholesterol [65, 66].

| Nomenclature                      | RAR-related orphan receptor-α | RAR-related orphan receptor-β | RAR-related orphan receptor-γ |
|-----------------------------------|-------------------------------|-------------------------------|-------------------------------|
| Systematic nomenclature           | NR1F1                         | NR1F2                         | NR1F3                         |
| HGNC, UniProt                     | *RORA, P35398*                | *RORB, Q92753*               | *RORC, P51449*               |
| Endogenous agonists               | cholesterol [66, 114]         | –                             | –                             |
| Selective agonists                | 7-hydroxycholesterol [14], cholesterol sulphate [14, 66] | –                             | –                             |

**Comments:** tretinoin shows selectivity for RORβ within the ROR family [136]. RORα has been suggested to be a nuclear receptor responding to melatonin [154].

1H. Liver X receptor-like receptors

Nuclear hormone receptors → 1H. Liver X receptor-like receptors

Overview: Liver X and farnesoid X receptors (LXR and FXR, nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [105]) are members of a steroid analogue-activated nuclear receptor subfamily, which form heterodimers with members of the retinoid X receptor family. Endogenous ligands for LXRs include hydroxycholesters (OHC), while FXRs appear to be activated by bile acids.

| Nomenclature                  | Farnesoid X receptor | Farnesoid X receptor-β | Liver X receptor-α | Liver X receptor-β |
|-------------------------------|----------------------|------------------------|-------------------|-------------------|
| Systematic nomenclature       | NR1H4                | NR1H5                  | NR1H3             | NR1H2             |
| HGNC, UniProt                 | NR1H4, Q96R11        | NR1H5P, –              | NR1H3, Q13133     | NR1H2, P55055     |
| Potency order                 | chenodeoxycholic acid > lithocholic acid, deoxycholic acid [92, 115] | –                      | 20S-hydroxycholesterol, 22R-hydroxycholesterol, 24(S)-hydroxycholesterol > 25-hydroxycholesterol, 27-hydroxycholesterol [79] | 20S-hydroxycholesterol, 22R-hydroxycholesterol, 24(S)-hydroxycholesterol > 25-hydroxycholesterol, 27-hydroxycholesterol [79] |
| Endogenous agonists           | –                    | lanosterol [113] – Mouse | –                | –                |
| Selective agonists            | GW4064 [94], obeticholic acid [116], fexaramine [36] | –                      | –                | –                |
| Selective antagonists         | guggulsterone (pIC50 5.7–6) [157] | –                      | –                | –                |

Comments: T0901317 [122] and GW3965 [27] are synthetic agonists acting at both LXRE and LXRβ with less than 10-fold selectivity.

11. Vitamin D receptor-like receptors

Nuclear hormone receptors → 11. Vitamin D receptor-like receptors

**Overview:** Vitamin D (VDR), Pregnane X (PXR) and Constitutive Androstane (CAR) receptors (nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [105]) are members of the NR1I family of nuclear receptors, which form heterodimers with members of the retinoid X receptor family. PXR and CAR are activated by a range of exogenous compounds, with no established endogenous physiological agonists, although high concentrations of bile acids and bile pigments activate PXR and CAR [105].

| Nomenclature                  | Vitamin D receptor | Pregnane X receptor | Constitutive androstane receptor |
|-------------------------------|--------------------|---------------------|----------------------------------|
| Systematic nomenclature       | NR1I1              | NR1I2               | NR1I3                           |
| HGNC, UniProt                 | VDR, P11473        | NR1I2, O75469       | NR1I3, Q14994                   |
| Endogenous agonists           | 1,25-dihydroxyvitamin D3 [11, 39] | 17β-estradiol [64] | –                               |
| Selective agonists            | seocalcitol [28, 153], doxercalciferol | hyperforin [106, 152], 5β-pregnane-3,20-dione [64], lovastatin [81], rifampicin [15, 81] | TCPOBOP [144] – Mouse, CITCO [91] |

2A. Hepatocyte nuclear factor-4 receptors

Nuclear hormone receptors → 2A. Hepatocyte nuclear factor-4 receptors

**Overview:** The nomenclature of hepatocyte nuclear factor-4 receptors is agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [6]. While linoleic acid has been identified as the endogenous ligand for HNF4α its function remains ambiguous [163]. HNF4γ has yet to be paired with an endogenous ligand.
### Nomenclature

| Nomenclature | Systematic nomenclature | Endogenous agonists | Selective antagonists | Comments |
|--------------|--------------------------|---------------------|-----------------------|----------|
| Hepatocyte nuclear factor-4-α | NR2A1 | linoleic acid [163] | Bl6025 [71] | HNF4α has constitutive transactivation activity [163] and binds DNA as a homodimer [63]. |
| Hepatocyte nuclear factor-4-γ | NR2A2 | – | – | – |

### 2B. Retinoid X receptors

#### Nuclear hormone receptors → 2B. Retinoid X receptors

**Overview:** Retinoid X receptors (nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [45]) are NR2B family members activated by all-trans Retinoid X receptors (nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [45]) are NR2B family members activated by all-trans retinoic acid and the RXR-selective agonists bexarotene and LG100268, sometimes referred to as rexinoids. UVI3003 [108] and HX 531 [37] have been described as a pan-RXR antagonists. These receptors form RXR-RAR heterodimers and RXR-RXR homodimers [22, 96].

| Nomenclature | Retinoid X receptor-α | Retinoid X receptor-β | Retinoid X receptor-γ |
|--------------|-----------------------|-----------------------|-----------------------|
| Systematic nomenclature | NR2B1 | NR2B2 | NR2B3 |
| HGNC, UniProt | RXRA, P19793 | RXRB, P28702 | RXRG, P48443 |
| Sub/family-selective agonists | bexarotene [16, 21, 141] | bexarotene [16, 21, 141] | bexarotene [16, 21, 141] |

2C. Testicular receptors

Nuclear hormone receptors → 2C. Testicular receptors

Overview: Testicular receptors (nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [6]) have yet to be officially paired with an endogenous ligand, although testicular receptor 4 has been reported to respond to retinoids.

| Nomenclature        | Testicular receptor 2 | Testicular receptor 4 |
|---------------------|-----------------------|-----------------------|
| Systematic nomenclature | NR2C1                | NR2C2                  |
| HGNC, UniProt       | NR2C1, P13056         | NR2C2, P49116          |
| Endogenous agonists | -                     | retinol [169], tretinoin [169] |
| Comments             | Forms a heterodimer with TR4; gene disruption appears without effect on testicular development or function [132]. | Forms a heterodimer with TR2. |

Steroid hormone receptors

Overview: Steroid hormone receptors (nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [30, 87]) are nuclear hormone receptors of the NR3 class, with endogenous agonists that may be divided into 3-hydroxysteroids (estrone and 17β-estradiol) and 3-ketosteroids (dihydrotestosterone [DHT], aldosterone, cortisol, corticosterone, progesterone and testosterone). These receptors exist as dimers coupled with chaperone molecules (such as hsp90β [HSP90AB1, P08238] and immunophilin FKBP52: FKBP4, Q02790), which are shed on binding the steroid hormone. Although rapid signalling phenomena are observed [83, 119], the principal signalling cascade appears to involve binding of the activated receptors to nuclear hormone response elements of the genome, with a 15-nucleotide consensus sequence AGAACAnnnTGTTCT (i.e. an inverted palindrome) as homo- or heterodimers. They also affect transcription by protein-protein interactions with other transcription factors, such as activator protein 1 (AP-1) and nuclear factor κB (NF-κB). Splice variants of each of these receptors can form functional or non-functional monomers that can dimerize to form functional or non-functional receptors. For example, alternative splicing of PR mRNA produces A and B monomers that combine to produce functional AA, AB and BB receptors with distinct characteristics [145]. A 7TM receptor responsive to estrogen (GPER1, Q99527, also known as GPR30, see [118]) has been described. Human orthologues of 7TM ‘membrane progestin receptors’ (PAQR7, PAQR8 and PAQR5), initially discovered in fish [170, 171], appear to localize to intracellular membranes and respond to ‘non-genomic’ progesterone analogues independently of G proteins [134].

3A. Estrogen receptors

Overview: Estrogen receptor (ER) activity regulates diverse physiological processes via transcriptional modulation of target genes. The selection of target genes and the magnitude of the response, be it induction or repression, are determined by many factors, including the effect of the hormone ligand and DNA binding on ER structural conformation, and the local cellular regulatory environment. The cellular environment defines the specific complement of DNA enhancer and promoter elements present and the availability of coregulators to form functional transcription complexes. Together, these determinants control the resulting biological response.

| Nomenclature   | Estrogen receptor-α                          | Estrogen receptor-β                          |
|----------------|---------------------------------------------|---------------------------------------------|
| Systematic nomenclature | NR3A1                                      | NR3A2                                      |
| HGNC, UniProt   | ESR1, P03372                               | ESR2, Q92731                               |
| Endogenous agonists | estriol [74], estrone [74]            | –                                          |

Searchable database: http://www.guidetopharmacology.org/index.jsp
Full Contents of ConciseGuide: http://onlinelibrary.wiley.com/doi/10.1111/bph.13880/full
Comments: R,R-THC exhibits partial agonist activity at ERα [99, 140]. Estrogen receptors may be blocked non-selectively by tamoxifen and raloxifene and labelled by [3H]17β-estradiol and [3H]tamoxifen. Many agents thought initially to be antagonists at estrogen receptors appear to have tissue-specific efficacy (e.g. Tamoxifen is an antagonist at estrogen receptors in the breast, but is an agonist at estrogen receptors in the uterus), hence the descriptor SERM (selective estrogen receptor modulator) or SnuRM (selective nuclear receptor modulator). Y134 has been suggested to be an ERα-selective estrogen receptor modulator [111].

3C. 3-Ketosteroid receptors  S222
Nomenclature

Mineralocorticoid receptor

NR3C2

Progesterone receptor

NR3C3

HGNC, UniProt

NR3C2, P08235

PGR, P06401

Rank order of potency

corticosterone, cortisol, aldosterone [38, 125], progesterone [125]

progesterone [38]

Selective agonists

finerenone (pIC_{50} 7.7) [20], eplerenone (pK_i 6.9) [5], onapristone (pIC_{50} 6.3) [165], RU28318, ZK112993

ulipristal acetate (pIC_{50} 9.7) [123], mifepristone (Mixed) (pK_i 9) [167], onapristone (pK_i 7.7) [54], ZK112993

Selective antagonists

medoxyprogesterone (Affinity at human PR-A) [166], ORG2058, levonorgestrel [9, 128]

Labelled ligands

[^3]Haldosterone (Selective Agonist) [44, 137] – Rat

[^3]HORG2058 (Selective Agonist)

Comments: [^3]Dexamethasone also binds to MR in vitro. PR antagonists have been suggested to subdivide into Type I (e.g. onapristone) and Type II (e.g. ZK112993) groups. These groups appear to promote binding of PR to DNA with different efficacies and evoke distinct conformational changes in the receptor, leading to a transcription-neutral complex [43, 82]. Mutations in AR underlie testicular feminization and androgen insensitivity syndromes, spinal and bulbar muscular atrophy (Kennedy’s disease).
