Abstract In this paper, the following critical biharmonic elliptic problem

\[
\begin{aligned}
\Delta^2 u &= \lambda u + \mu u \ln u^2 + |u|^{2^* - 2} u, \quad x \in \Omega, \\
u &= \frac{\partial u}{\partial \nu} = 0, \quad x \in \partial \Omega
\end{aligned}
\]

is considered, where \( \Omega \subset \mathbb{R}^N \) is a bounded smooth domain with \( N \geq 5 \). Some interesting phenomenon occurs due to the uncertainty of the sign of the logarithmic term. It is shown, mainly by using Mountain Pass Lemma, that the problem admits at least one nontrivial weak solution under some appropriate assumptions of \( \lambda \) and \( \mu \). Moreover, a nonexistence result is also obtained. Comparing the results in this paper with the known ones, one sees that some new phenomena occur when the logarithmic perturbation is introduced.

Keywords Biharmonic equation; Critical exponent; Mountain Pass Lemma; Logarithmic perturbation.

1 Introduction

In this paper, we are concerned with the following critical biharmonic elliptic problem

\[
\begin{aligned}
\Delta^2 u &= \lambda u + \mu u \ln u^2 + |u|^{2^* - 2} u, \quad x \in \Omega, \\
u &= \frac{\partial u}{\partial \nu} = 0, \quad x \in \partial \Omega
\end{aligned}
\]

where \( \Omega \subset \mathbb{R}^N (N \geq 5) \) is a bounded domain with smooth boundary \( \partial \Omega \), \( \nu \) is the unit outward normal on \( \partial \Omega \), \( 2^* := \frac{2N}{N-4} \) is the critical Sobolev exponent for the embedding \( H^2_0(\Omega) \hookrightarrow L^{2^*} (\Omega) \), \( \lambda, \mu \in \mathbb{R} \), and \( \Delta^2 \) is the biharmonic operator.

Problem (1.1) is closely related to the stationary version of the following equation

\[ u_{tt} + \Delta^2 u = f(t, x, u), \quad (1.2) \]

which has wide application in describing a variety of phenomena in physics and other applied sciences. For example, (1.2) can be used to describe the longitudinal motion of an elastic-plastic bar. Interested reader may also refer to [1, 3, 4, 5] for more background of problems like (1.2).

On the other hand, problem (1.1) is a special form of the following critical elliptic boundary value problem

\[
\begin{cases}
(-\Delta)^m u = \lambda u + |u|^{p-2} u + f(x, u), & x \in \Omega, \\
D^\alpha u = 0, & \text{for } |\alpha| \leq m - 1, \quad x \in \partial\Omega,
\end{cases}
\]

(1.3)

where \( m \in \mathbb{N}, \Omega \subset \mathbb{R}^N (N > 2m) \) is a bounded smooth domain, \( \lambda \in \mathbb{R}, p = \frac{2N}{N-2m} \) and \( f(x, u) \) is a nonlinear term. One of the main features of problem (1.3) is that it involves a critical term in the sense that the embedding \( H^m_0(\Omega) \hookrightarrow L^p(\Omega) \) is not compact, which brings essential difficulty when proving the existence of weak solutions to (1.3). For this reason, the study of elliptic problems with critical exponents is both interesting and challenging. However, it was mainly after the outstanding work of Brézis and Nirenberg [8] that such problems were extensively studied, and many interesting results were obtained on the existence, nonexistence and multiplicity of weak solutions to such problems.

In [8], problem (1.3) with \( m = 1, N \geq 3 \) and \( f(x, u) = 0 \) was studied by Brézis and Nirenberg, and a new idea for establishing a Palais-Smale compactness condition for the energy functional was introduced. This makes it possible to obtain a solution of the critical problem by using Mountain Pass Lemma. Interestingly, they found that the conditions for the existence of positive solutions are quite different between \( N \geq 4 \) and \( N = 3 \). When \( N \geq 4 \), it is shown that problem (1.3) admits a positive solution if \( \lambda \in (0, \tilde{\lambda}_1) \), where \( \tilde{\lambda}_1 \) denotes the first eigenvalue of \( -\Delta \) with homogeneous Dirichlet boundary condition on \( \Omega \). When \( N = 3 \) and \( \Omega \) is a ball, problem (1.3) has a positive solution if and only if \( \lambda \in (\frac{4}{9} \lambda_1, \tilde{\lambda}_1) \). They also proved that problem has no solution if \( \lambda < 0 \) and \( \Omega \) is a star-shaped domain, which directly follows from Pohozaev’s identity (see [17]). Later, their ideas were borrowed by Gu et al. [15] to study higher order critical problems, i.e. problem (1.3) with \( m = 2, f(x, u) = 0 \) and \( N \geq 5 \). They showed that problem (1.3) possesses at least one nontrivial weak solution if \( \lambda \in (0, \lambda_1(\Omega)) \) and \( N \geq 8 \). When \( N = 5, 6, 7 \) and \( \Omega \) is a ball, they showed that there exist two positive constants \( \lambda^{**}(N) < \lambda^{*}(N) < \lambda_1(\Omega) \) such that problem has at least one nontrivial weak solution if \( \lambda \in (\lambda^{*}(N), \lambda_1(\Omega)) \), and there has no nontrivial solution if \( \lambda < \lambda^{**}(N) \). Here \( \lambda_1(\Omega) \) denotes the first eigenvalue of \( \Delta^2 \) with homogeneous Dirichlet boundary condition on \( \Omega \). The above mentioned results imply that whether or not problem (1.3) with \( m = 1, 2 \) and \( f(x, u) = 0 \) admits a weak solution depends not only on the parameter \( \lambda \), but also on the space dimension \( N \). It is worth mentioning that there are also many other interesting works about elliptic problems with critical exponents, among the huge amount of which, we only refer the interested reader to [2, 6, 9, 10, 11, 12, 13, 16, 20] and the references therein.
A natural question is whether or not a lower order perturbation will affect the existence and nonexistence results for problem (1.3). Recently, Deng et al. [10] investigated the existence and nonexistence of positive solutions to problem (1.3) with $m = 1$, $f(x,u) = \mu u \ln u^2$ and $\mu \neq 0$. After some delicate estimates on the logarithmic term, they showed that problem (1.3) admits a positive ground state solution, which is also a mountain pass type solution when $N \geq 4$, $\lambda \in \mathbb{R}$ and $\mu > 0$. Comparing this result with the corresponding one in [8] one sees that the range of $\lambda$ for the problem with $\mu > 0$ to admit a positive solution is larger than that with $\mu = 0$, which implies that the logarithmic term has a positive effect for the existence of positive solutions in this case. When $\mu < 0$, the discussion becomes a little more complicated. However, when $N = 3, 4$, they also established the existence of at least one positive solution under some additional assumptions on $\lambda$ and $\mu$. This also shows that the appearance of logarithmic perturbation leads to some interesting phenomenon, mainly due to the uncertainty of the sign of $u \ln u^2$.

Inspired mainly by [10, 15], we study problem (1.1) and consider how the term $u \ln u^2$ affects the existence and nonexistence of nontrivial solutions to problem (1.1). It turns out that the results depend heavily on the sign of $\mu$. When $\mu > 0$, we first show that the energy functional satisfies the mountain pass geometry around 0. Then we obtain a local compactness condition (known as $(PS)_c$ condition) for the (PS) sequences, with the help of Brézis-Lieb’s lemma. Finally, a mountain pass type solution follows from a standard variational argument. A crucial step in this process is to prove that the mountain pass level is smaller than a critical number $c(S)$, which is done after some delicate estimates on various norms of the truncated Talenti functions. Special attention is paid to the case $N = 8$, due to the critical characterization of the integrations. When $\mu < 0$, the situation is different. Although the mountain pass geometry is still satisfied and the mountain pass level around 0 is bounded from above by the same critical number, we cannot prove the $(PS)_c$ condition in general. By applying the Mountain Pass Lemma without compactness condition, we obtain a nontrivial solution to problem (1.1). But we donot know whether or not the solution is of mountain pass type. Moreover, a nonexistence result is also obtained when $\mu < 0$. Comparing our results with that in [15], one sees that the logarithmic term plays a positive role for problem (1.1) to admit weak solutions when $N \geq 8$ and this leads to some interesting phenomena.

This paper is organized as follows. In Section 2 we give some notations, definitions and introduce some necessary lemmas. The main results of this paper are also stated in this section. In Section 3 we prove some technical lemmas and the detailed proof of the main results will be given in Section 4.

2 Preliminaries and the main results.

In this section, we first introduce some notations and definitions that will be used throughout the paper. In what follows, we denote by $\| \cdot \|_p$ the $L^p(\Omega)$ norm for $1 \leq p \leq \infty$. The Sobolev space $H_0^1(\Omega)$ will be equipped with the norm $\|u\| := \|u\|_{H_0^1(\Omega)} = \|\Delta u\|_2$, which is equivalent to the full one due to Poincaré’s inequality, and its dual space is denoted by $H^{-2}(\Omega)$. For other
linear normed space $X$, we denote its norm by $\| \cdot \|_X$. We always use $\rightarrow$ and $\rightharpoonup$ to denote the strong and weak convergence in each Banach space, respectively, and use $C$ to denote (possibly different) generic positive constants. We always denote by $B_R(x_0)$ the ball with radius $R$ centered at $x_0$ in $\mathbb{R}^N$. Sometimes $B_R(0)$ will be simply written as $B_R$ if no confusion arises. We use $\omega_N$ to denote the area of the unit sphere in $\mathbb{R}^N$. For each $t > 0$, $O(t)$ denotes the quantity satisfying $\frac{|O(t)|}{t^p} \leq C$, and $o(t)$ means that $\frac{|O(t)|}{t^p} \to 0$ as $t \to 0$. Set

$$\rho_{\text{max}} := \sup \{ R > 0 : \text{there exists an } x \in \Omega \text{ such that } B_R(x) \subset \Omega \}$$

and $o_n(1)$ is an infinitesimal as $n \to \infty$.

We use $S$ to denote the best embedding constant from $H_0^2(\Omega)$ to $L^{2^*'}(\Omega)$, i.e.,

$$S = \inf_{u \in H_0^2(\Omega) \setminus \{0\}} \frac{\|u\|^2}{\|u\|_{2^*'}}.$$  \hfill (2.1)

$\lambda_1(\Omega) > 0$ denotes the first eigenvalue of eigenvalue problem

$$\begin{aligned}
\Delta^2 u &= \lambda u, & x &\in \Omega, \\
\frac{\partial u}{\partial \nu} &= 0, & x &\in \partial \Omega.
\end{aligned}$$  \hfill (2.3)

Finally, following the ideas of [10], we introduce the following sets

$$A := \{ (\lambda, \mu) : \mu > 0, \lambda \in \mathbb{R} \},$$

$$B := \{ (\lambda, \mu) : \mu < 0, \lambda \in [0, \lambda_1(\Omega)), \frac{2}{N} \left( \frac{\lambda_1(\Omega) - \lambda}{\lambda_1(\Omega)} \right) + \frac{N}{2} |\Omega| > 0 \},$$

$$C := \{ (\lambda, \mu) : \mu < 0, \lambda \in \mathbb{R}, \frac{2}{N} S_{2^*}^2 + \frac{\mu}{2} e^{-\frac{2}{N} |\Omega|} > 0 \}.$$  

In this paper, we consider weak solutions to problem (1.1) in the following sense.

**Definition 2.1.** (Weak solution) A function $u \in H_0^2(\Omega)$ is called a weak solution to problem (1.1), if for all $\phi \in H_0^2(\Omega)$, it holds that

$$\int_\Omega \Delta u \Delta \phi dx - \lambda \int_\Omega u \phi dx - \mu \int_\Omega u \ln u dx - \int_\Omega |u|^{2^* - 2} u \phi dx = 0.$$

The energy functional associated with problem (1.1) is given by

$$I(u) = \frac{1}{2} \|u\|^2 - \frac{1}{2} \lambda \|u\|_2^2 + \frac{1}{2} \mu \|u\|_2^2 - \frac{1}{2} \mu \int_\Omega u^2 \ln u dx + \frac{1}{2^*} \|u\|_{2^*}^{2^*}, \quad \forall u \in H_0^2(\Omega).$$

Obviously, the energy functional $I(u)$ is a $C^1$ functional in $H_0^2(\Omega)$ (see [10] [15]). From $I(u) = I(|u|)$, we may assume that $u \geq 0$ in the sequel.

For each $u \in H_0^2(\Omega) \setminus \{0\}$, consider the fibering maps $\psi_u(t) : (0, +\infty) \to \mathbb{R}$ defined by

$$\psi_u(t) = I(tu) = \frac{1}{2} t^2 \|u\|^2 - \frac{1}{2} \lambda t^2 \|u\|_2^2 + \frac{1}{2} \mu t^2 \|u\|_2^2 - \frac{1}{2} \mu \|u\|_2^2 t^2 \ln t^2$$

$$- \frac{1}{2} \mu t^2 \int_\Omega u^2 \ln u dx + \frac{1}{2^*} t^{2^*} \|u\|_{2^*}^{2^*}.$$  \hfill (2.4)
In order to obtain the existence of weak solutions, we introduce the Nehari manifold
\[ N = \{ u \in H^2_0(\Omega) \setminus \{0\} : \langle I'(u), u \rangle = 0 \} = \{ u \in H^2_0(\Omega) \setminus \{0\} : \psi_u'(1) = 0 \}. \]

Here we use \( \langle \cdot, \cdot \rangle \) to denote the pairing between \( H^{-2}(\Omega) \) and \( H^2_0(\Omega) \). We usually split \( N \) into three disjoint parts as
\[ N = N^+ \cup N^0 \cup N^-, \]
where
\[ N^+ = \{ u \in N : \psi_u''(1) > 0 \}, \]
\[ N^- = \{ u \in N : \psi_u''(1) < 0 \}, \]
\[ N^0 = \{ u \in N : \psi_u''(1) = 0 \}. \]

It is well known that if \( u \in H^2_0(\Omega) \) is a nontrivial solution to problem (1.1), then \( u \in N \).

Next we introduce the definition of a compactness condition, usually referred to as the \((PS)_c\) condition.

**Definition 2.2.** \((PS)_c\) condition) Assume that \( X \) is a real Banach space, \( I : X \to \mathbb{R} \) is a \( C^1 \) functional and \( c \in \mathbb{R} \). We say that \( \{ u_n \} \subset H^2_0(\Omega) \) is a \((PS)_c\) sequence for \( I \) if
\[ I(u_n) \to c \text{ and } I'(u_n) \to 0 \text{ in } X^{-1}(\Omega) \text{ as } n \to \infty, \]
where \( X^{-1} \) is the dual space of \( X \). Furthermore, we say that \( I \) satisfies the \((PS)_c\) condition if any \((PS)_c\) sequence has a convergent subsequence.

The following two lemmas will play a fundamental role in proving the existence of weak solutions when \( \mu > 0 \). The first one is the famous Mountain Pass Lemma, and the second one is Brézis-Lieb’s lemma.

**Lemma 2.1.** (Mountain Pass Lemma [19]) Assume that \((X, \| \cdot \|_X)\) is a real Banach space, \( I : X \to \mathbb{R} \) is a \( C^1 \) functional and \( c \in \mathbb{R} \). We say that \( \{ u_n \} \subset H^2_0(\Omega) \) is a \((PS)_c\) sequence for \( I \) if
\[ I(u_n) \to c \text{ and } I'(u_n) \to 0 \text{ in } X^{-1}(\Omega) \text{ as } n \to \infty, \]
where \( X^{-1} \) is the dual space of \( X \) and \( c_0 = \inf_{\gamma \in \Gamma} \max_{t \in [0, 1]} I(\gamma(t)) \geq \beta, \Gamma = \{ \gamma \in C([0, 1], X) : \gamma(0) = 0, I(\gamma(1)) < 0 \}, \)
which is called the mountain pass level. Furthermore, \( c_0 \) is a critical value of \( I \) if \( I \) satisfies the \((PS)_{c_0}\) condition.

**Lemma 2.2.** (Brézis-Lieb’s lemma [7]) Let \( p \in (1, \infty) \). Suppose that \( \{ u_n \} \) is a bounded sequence in \( L^p(\Omega) \) and \( u_n \to u \) a.e. in \( \Omega \). Then
\[ \lim_{n \to \infty} (\| u_n \|_p^p - \| u_n - u \|_p^p) = \| u \|_p^p. \]
To deal with the logarithmic nonlinearity $u \ln u^2$, we need the following two lemmas. Lemma 2.3 can be directly verified and Lemma 2.4 is the modified logarithmic Sobolev inequality.

**Lemma 2.3.** (1) For all $t \in (0, 1]$, there holds that

$$|t \ln t| \leq \frac{1}{e}. \quad (2.5)$$

(2) For any $\alpha, \delta > 0$, there exists a positive constant $C_{\alpha, \delta}$ such that

$$|\ln t| \leq C_{\alpha, \delta} (t^\alpha + t^{-\delta}), \quad \forall t > 0. \quad (2.6)$$

(3) For any $\sigma > 0$, there holds that

$$\frac{\ln t}{t^\sigma} \leq \frac{1}{\sigma e}, \quad \forall t > 0. \quad (2.7)$$

**Lemma 2.4.** (Logarithmic Sobolev inequality) Assume that $\Omega \subset \mathbb{R}^N (N \geq 5)$ is a bounded domain with smooth boundary. Then for any $u \in H^2_0(\Omega)$ and $a > 0$, we have

$$\int_{\Omega} u^2 \ln u^2 dx \leq \frac{a^2}{\pi \lambda_1} \|u\|^2 + (\ln \|u\|_2^2 - N(1 + \ln a)) \|u\|_2^2, \quad (2.8)$$

where $\lambda_1 > 0$ denotes the first eigenvalue of $-\Delta$ with zero Dirichlet boundary condition on $\Omega$.

lerm 2.4. (Logarithmic Sobolev inequality) Assume that $\Omega \subset \mathbb{R}^N (N \geq 5)$ is a bounded domain with smooth boundary. Then for any $u \in H^2_0(\Omega)$ and $a > 0$, we have

$$\int_{\Omega} u^2 \ln u^2 dx \leq \frac{a^2}{\pi \lambda_1} \|u\|^2 + (\ln \|u\|_2^2 - N(1 + \ln a)) \|u\|_2^2, \quad (2.8)$$

where $\lambda_1 > 0$ denotes the first eigenvalue of $-\Delta$ with zero Dirichlet boundary condition on $\Omega$.

**Proof.** According to [14], for any $u \in H^2(\mathbb{R}^N)$ and $a > 0$, one has

$$\int_{\mathbb{R}^N} u^2 \ln u^2 dx \leq \frac{a^2}{\pi} \int_{\mathbb{R}^N} |\nabla u|^2 dx + \left( \ln \|u\|_{L^2(\mathbb{R}^N)}^2 - N(1 + \ln a) \right) \|u\|_{L^2(\mathbb{R}^N)}^2. \quad (2.9)$$

For any $u \in H^2_0(\Omega)$, extend the domain of $u$ to $\mathbb{R}^N$ by letting $u(x) = 0$ for $x \in \mathbb{R}^N \setminus \Omega$ and still denote it by $u$. Then $u \in H^2(\mathbb{R}^N)$ and therefore the above inequality holds with $\mathbb{R}^N$ replaced by $\Omega$. Moreover, by integrating by parts and applying Cauchy’s inequality with $\varepsilon$, one has

$$\int_{\Omega} |\nabla u|^2 dx = \int_{\partial \Omega} u \frac{\partial u}{\partial n} ds - \int_{\Omega} u \Delta u dx = -\int_{\Omega} u \Delta u dx$$

$$\leq \frac{\varepsilon}{2} \int_{\Omega} |u|^2 dx + \frac{1}{2\varepsilon} \int_{\Omega} |\Delta u|^2 dx$$

$$\leq \frac{\varepsilon}{2\lambda_1} \int_{\Omega} |\nabla u|^2 dx + \frac{1}{2\varepsilon} \int_{\Omega} |\Delta u|^2 dx.$$
Theorem 2.1. (i) Assume that \(N \geq 8\). If \((\lambda, \mu) \in A\), then problem (1.1) has a nonnegative mountain pass type solution, which is also a ground state solution.

(ii) Assume that \(N = 8\). If \((\lambda, \mu) \in B \cup C\) and \(\frac{25 \cdot 1920 e^{\frac{\lambda}{\mu}} + 34}{\rho_{\text{max}}^4} < 1\), then there exists at least one nonnegative nontrivial weak solution to problem (1.1), where

\[
\rho_{\text{max}} := \sup\{R > 0 : \text{there exists an } x \in \Omega \text{ such that } B_R(x) \subset \Omega\}.
\]

(iii) Assume that \(N = 5, 6, 7\). If \((\lambda, \mu) \in B \cup C\), then there exists at least one nonnegative nontrivial weak solution to problem (1.1).

Remark 2.1. Notice that the assumption \(\frac{25 \cdot 1920 e^{\frac{\lambda}{\mu}} + 34}{\rho_{\text{max}}^4} < 1\) implies that the domain \(\Omega\) should be appropriately large.

As for the nonexistence result for problem (1.1), we have the following theorem.

Theorem 2.2. Assume that \(N \geq 5\). If \(-\mu (N - 4) + \mu (N - 4) \ln (\frac{-\mu (N - 4)}{4}) + \lambda - \lambda_1(\Omega) \geq 0\) and \(\mu < 0\), then problem (1.1) has no positive solutions.

3 Some technical lemmas

We begin this section with a lemma that gives some properties of the Nehari manifold and fibering maps, which will help us to show that the mountain pass solution is a ground state solution to problem (1.1) when \(\mu > 0\).

Lemma 3.1. Assume that \(\mu > 0\). Then, \(N = N^-\). Moreover, for any \(u \in H^2_0(\Omega) \setminus \{0\}\), there exists a unique \(t_u \geq 0\) such that \(\max_{t \geq 0} \psi_u(t) = \psi_u(t_u)\).

Proof. For each \(u \in N\), we have

\[
\psi_u'(1) = \|u\|^2 - \lambda \|u\|^2_2 - \mu \int_\Omega u^2 \ln u^2 \, dx - \|u\|^2_{2^*} = 0.
\]

Consequently, it follows from \(\mu > 0\) that

\[
\psi_u''(1) = \|u\|^2 - \lambda \|u\|^2_2 - 2\mu \|u\|^2_2 - \mu \int_\Omega u^2 \ln u^2 \, dx - (2^{**} - 1) \|u\|^2_{2^*}
= -2\mu \|u\|^2_2 - (2^{**} - 2) \|u\|^2_{2^*}.
< 0,
\]

which implies that \(u \in N^- (\subset N)\).

For any \(u \in H^2_0(\Omega) \setminus \{0\}\), according the definition of \(\psi_u(t)\) in (2.4), we deduce that

\[
\lim_{t \to 0} \psi_u(t) = 0, \quad \lim_{t \to +\infty} \psi_u(t) = -\infty,
\]

and \(\psi_u(t)\) is positive for \(t > 0\) suitably small (since \(\mu > 0\)), which imply that there exists a unique \(t_u > 0\) such that \(\max_{t \geq 0} \psi_u(t) = \psi_u(t_u)\). Indeed, the existence of \(t_u\) is obvious. If
there were \(0 < t_1(u) < t_2(u)\) such that \(\max_{t \geq 0} \psi_u(t) = \psi_u(t_1(u)) = \psi_u(t_2(u))\), then there must be a \(t_3(u) \in (t_1(u), t_2(u))\) which is a local minimum of \(\psi_u(t)\). Direct computation shows that \(t_3(u)u \in N^+\), which is impossible since \(N = N^-\). This completes the proof. \(\Box\)

**Remark 3.1.** (i) Following from Lemma 3.1, if \(\mu > 0\), one can give an equivalent characterization of \(c_0\) defined in Lemma 3.1, i.e., \(c_0 = c_N\), where

\[c_N := \inf_{u \in N} I(u) = \inf_{u \in H^2_0(\Omega) \setminus \{0\}} \max_{t \geq 0} I(tu).\]

The proof of this equivalent characterization can be found in Theorem 4.2 of [17].

(ii) Since all the nontrivial critical points of \(I\) belong to \(N\), if \(u\) is a nontrivial critical point of \(I\) satisfying \(I(u) = c_N\), it must be a ground state solution to problem (1.1).

In order to apply the Mountain Pass Lemma, we first verify the mountain pass geometry for \(I\) when \((\lambda, \mu) \in A \cup B \cup C\).

**Lemma 3.2.** Assume that \(N \geq 5\) and \((\lambda, \mu) \in A \cup B \cup C\). Then the functional \(I(u)\) satisfies the mountain pass geometry.

**Proof.** The proof is divided into three cases.

**Case 1:** \((\lambda, \mu) \in A\).

Since \(\mu > 0\), by using Sobolev embedding inequality and applying (2.7) with \(\sigma = \frac{2^* - 2}{2}\), one has

\[
- \frac{1}{2} \lambda \|u\|^2 + \frac{1}{2} \mu \|u\|^2 - \frac{1}{2} \mu \int_{\Omega} u^2 \ln u^2 \, dx \geq \frac{1}{2} \lambda \|u\|^2 - \frac{1}{2} \mu \int_{\Omega} u^2 \ln u^2 \, dx
= - \frac{\mu}{2} \int_{\Omega} u^2 \left(\frac{\lambda}{\mu} + \ln u^2\right) \, dx - \frac{\mu}{2} \int_{\Omega} u^2 \ln(e^{\frac{\lambda}{\mu}} u^2) \, dx
= - \frac{\mu}{2} e^{-\frac{\lambda}{\mu}} \int_{\{e^{\frac{\lambda}{\mu}} u^2 \leq 1\}} e^{\frac{\lambda}{\mu}} u^2 \ln(e^{\frac{\lambda}{\mu}} u^2) \, dx - \frac{\mu}{2} e^{-\frac{\lambda}{\mu}} \int_{\{e^{\frac{\lambda}{\mu}} u^2 \geq 1\}} e^{\frac{\lambda}{\mu}} u^2 \ln(e^{\frac{\lambda}{\mu}} u^2) \, dx
\geq - \frac{\mu}{2} e^{-\frac{\lambda}{\mu}} \int_{\{e^{\frac{\lambda}{\mu}} u^2 \geq 1\}} e^{\frac{\lambda}{\mu}} u^2 \ln(e^{\frac{\lambda}{\mu}} u^2) \, dx
\geq - \frac{\mu}{2} e^{-\frac{\lambda}{\mu}} e^{-\frac{\lambda}{\mu}} S^{-\frac{2^*}{2}} \|u\|^{2^*},
\]

which ensures that

\[I(u) \geq \frac{1}{2} \|u\|^2 - \frac{S^{-\frac{2^*}{2}}}{2} \|u\|^{2^*} - \frac{\mu}{2} e^{-\frac{\lambda}{\mu}} e^{-\frac{\lambda}{\mu}} S^{-\frac{2^*}{2}} \|u\|^{2^*}.
\]

Therefore, there exist positive constants \(\beta\) and \(r\) such that

\[I(u) \geq \beta \text{ for all } \|u\| = r.
\]

On the other hand, for any \(u \in H^2_0(\Omega) \setminus \{0\}\), in view of (5.1), there exists a \(t_u > 0\) suitably large such that \(\|tu_u\| > r\) and \(\psi_u(t_u) = I(t_u u) < 0\).

**Case 2:** \((\lambda, \mu) \in B\).
Applying a similar argument to Case 1, one can show that there is a $v$ such that
\[ \|v\| > r \]
and Sobolev embedding inequality, yields
\[ I(u) \geq \frac{1}{2} \left( \frac{\lambda_1(\Omega) - \lambda}{\lambda_1(\Omega)} \right) \|u\|^2 - \frac{S^{\frac{\alpha^*}{2s^*}}}{2s^*} \|u\|^{2s^*} + \frac{\mu}{2} |\Omega|. \]
Set
\[ g(t) = \frac{1}{2} \left( \frac{\lambda_1(\Omega) - \lambda}{\lambda_1(\Omega)} \right) t^2 - \frac{S^{\frac{\alpha^*}{2s^*}}}{2s^*} t^{2s^*} + \frac{\mu}{2} |\Omega|, \quad t > 0. \]
By a direct calculation, $g$ takes its maximum at $t_0 := \left( \frac{\lambda_1(\Omega) - \lambda}{\lambda_1(\Omega)} \right)^{\frac{N-4}{4}} S^{\frac{4}{N}}$ and
\[ 0 < g(t_0) = \frac{2}{N} \left( \frac{\lambda_1(\Omega) - \lambda}{\lambda_1(\Omega)} \right)^{\frac{N}{2}} S^{\frac{4}{N}} + \frac{\mu}{2} |\Omega|, \]
due to $(\lambda, \mu) \in B$, which implies that there exist positive constants $\beta := g(t_0)$ and $r := t_0$ such that
\[ I(u) \geq \beta \text{ for all } \|u\| = r. \]
Applying a similar argument to Case 1, one can show that there is a $v \in H^1_0(\Omega)$ such that $\|v\| > r$ and $I(v) < 0$.

Case 3: $(\lambda, \mu) \in C$.

Since $\mu < 0$, using (2.3) again, one has
\[ -\frac{1}{2} \lambda \|u\|^2 + \frac{1}{2} \mu \|u\|^2 - \frac{1}{2} \lambda \int_{\Omega} u^2 \ln u^2 \, dx = -\frac{\mu}{2} \int_{\Omega} \frac{\lambda}{\mu} - 1 + \ln u^2 \, dx \]
\[ = -\frac{\mu}{2} e^{-\frac{\alpha^*}{2s^*} - 1} \int_{\Omega} e^{-\frac{\alpha^*}{2s^*} - 1} u^2 \ln(e^{-\frac{\alpha^*}{2s^*} - 1} u^2) \, dx \]
\[ = -\frac{\mu}{2} e^{-\frac{\alpha^*}{2s^*} - 1} \int_{\{e^{-\frac{\alpha^*}{2s^*} - 1} u^2 \geq 1\}} e^{-\frac{\alpha^*}{2s^*} - 1} u^2 \ln(e^{-\frac{\alpha^*}{2s^*} - 1} u^2) \, dx - \frac{\mu}{2} e^{-\frac{\alpha^*}{2s^*} - 1} \int_{\{e^{-\frac{\alpha^*}{2s^*} - 1} u^2 \leq 1\}} e^{-\frac{\alpha^*}{2s^*} - 1} u^2 \ln(e^{-\frac{\alpha^*}{2s^*} - 1} u^2) \, dx \]
\[ \geq -\frac{\mu}{2} e^{-\frac{\alpha^*}{2s^*} - 1} \int_{\{e^{-\frac{\alpha^*}{2s^*} - 1} u^2 \leq 1\}} e^{-\frac{\alpha^*}{2s^*} - 1} u^2 \ln(e^{-\frac{\alpha^*}{2s^*} - 1} u^2) \, dx \geq \frac{\mu}{2} e^{-\frac{\alpha^*}{2s^*} - 1} |\Omega|, \]
and
\[ I(u) \geq \frac{1}{2} \|u\|^2 - \frac{S^{\frac{\alpha^*}{2s^*}}}{2s^*} \|u\|^{2s^*} + \frac{\mu}{2} e^{-\frac{\alpha^*}{2s^*} - 1} |\Omega|. \]
Set
\[ \bar{g}(t) := \frac{1}{2} t^2 - \frac{S^{\frac{\alpha^*}{2s^*}}}{2s^*} t^{2s^*} + \frac{\mu}{2} e^{-\frac{\alpha^*}{2s^*} - 1} |\Omega|, \quad t > 0. \]
A direct calculation shows that $\tilde{g}$ takes its maximum at $\tilde{t}_0 := S^{\frac{N}{2}}$ and

$$0 < \tilde{g}(\tilde{t}_0) = 2N S^{\frac{N}{2}} + \frac{\mu}{2} e^{-\frac{\lambda}{r} |\Omega|},$$

due to $(\lambda, \mu) \in C$, which implies that there exist positive constants $\beta := \tilde{g}(\tilde{t}_0)$ and $r := \tilde{t}_0$ such that

$$I(u) \geq \beta \text{ for all } \|u\| = r.$$  

Applying a similar argument to Case 1, one can show that there is a $v \in H^2_0(\Omega)$ such that $\|v\| > r$ and $I(v) < 0$.

In a conclusion, $I$ satisfies the mountain pass geometry around 0 if $(\lambda, \mu) \in A \cup B \cup C$. The proof is complete.

Now we show the boundedness of $(PS)_c$ sequence of $I$.

**Lemma 3.3.** Assume that $N \geq 5$, $\mu \in \mathbb{R}\setminus\{0\}$ and $\lambda \in \mathbb{R}$. If $\{u_n\}$ is a $(PS)_c$ sequence of $I$, then $\{u_n\}$ must be bounded in $H^2_0(\Omega)$ for all $c \in \mathbb{R}$.

**Proof.** Recalling the definition of the $(PS)_c$ sequence $\{u_n\}$, we have

$$I(u_n) \to c \text{ and } I'(u_n) \to 0 \text{ in } H^2_0(\Omega) \text{ as } n \to \infty.$$

When $\mu < 0$, from the above equalities and using (2.5), we have, as $n \to \infty$, that

$$c + 1 + o_n(1) \|u_n\| \geq I(u_n) - \frac{1}{2} \langle I'(u_n), u_n \rangle$$

$$= \frac{2}{N}\|u_n\|^2 - \frac{2}{N}\lambda\|u_n\|^2 + \frac{1}{2}\mu\|u_n\|^2 - \frac{2}{N}\mu \int_\Omega u_n^2 \ln u_n^2 \, dx$$

$$= \frac{2}{N}\|u_n\|^2 - \frac{2}{N}\mu \int_\Omega u_n^2 \ln (e^{\frac{\lambda}{\mu} - \frac{\lambda}{\mu} + \frac{\lambda}{\mu}} u_n^2) \, dx$$

$$\geq \frac{2}{N}\|u_n\|^2 - \frac{2}{N}\mu e^{-\frac{\lambda}{\mu} + \frac{\lambda}{\mu}} \int_{e^{\frac{\lambda}{\mu} - \frac{\lambda}{\mu} + \frac{\lambda}{\mu}}}^{u_n^2 \leq 1} e^{\frac{\lambda}{\mu} - \frac{\lambda}{\mu}} u_n^2 \ln (e^{\frac{\lambda}{\mu} - \frac{\lambda}{\mu}} u_n^2) \, dx$$

$$\geq \frac{2}{N}\|u_n\|^2 - \frac{2}{N}\mu e^{-\frac{\lambda}{\mu} + \frac{\lambda}{\mu}} \|u_n\|^2 |\Omega|,$$

which shows that $\{u_n\}$ is bounded in $H^2_0(\Omega)$.

Assume now $\mu > 0$. It follows from the definition of $\{u_n\}$, we have, as $n \to \infty$, that

$$c + 1 + o_n(1) \|u_n\| \geq I(u_n) - \frac{1}{2} \langle I'(u_n), u_n \rangle = \frac{1}{2}\|u_n\|^2 + \frac{2}{N}\|u_n\|^2 \geq \frac{1}{2}\|u_n\|^2,$$

which shows that

$$\|u_n\|^2 \leq C + C \|u_n\|.$$

From this and (2.5), we can deduce, for $n$ large enough, that

$$\int_\Omega u_n^2 \ln u_n^2 \, dx \leq \frac{\lambda^2}{2\mu} \|u_n\|^2 + \left[ \ln(C + C \|u_n\|) - N(1 + \ln a) \right] (C + C \|u_n\|). \quad (3.2)$$
On the other hand, one has, as \( n \to \infty \), that
\[
c + 1 + o_n(1)\|u_n\| \geq I(u_n) - \frac{1}{2^{**}} \langle I'(u_n), u_n \rangle
\]
which equals
\[
= \frac{2}{N} \|u_n\|^2 - \frac{2}{N} \lambda \|u_n\|^2 + \frac{1}{2} \mu \|u_n\|^2 - \frac{2}{N} \mu \int_{\Omega} u_n^2 \ln u_n^2 \, dx
\]
\[
\geq \frac{2}{N} \|u_n\|^2 - C \|u_n\|^2 - \frac{2}{N} \mu \int_{\Omega} u_n^2 \ln u_n^2 \, dx.
\]

Then, in view of (3.2) and \( \mu > 0 \), one has, as \( n \to \infty \), that
\[
c + 1 + o_n(1)\|u_n\|
\geq \frac{2}{N} \|u_n\|^2 - (C + C \|u_n\|) - \frac{2}{N} \mu \left( \frac{a^2}{\pi \lambda_1} \|u_n\|^2 + \left( \ln(C + C \|u_n\|) - N(1 + \ln a) \right) (C + C \|u_n\|) \right)
\]
\[
= \frac{2}{N} \left( 1 - \frac{\mu a^2}{\pi \lambda_1} \right) \|u_n\|^2 - \frac{2}{N} \mu (C + C \|u_n\|) \ln(C + C \|u_n\|) + [2\mu N(1 + \ln a) - 1](C + C \|u_n\|)
\]
\[
\geq \frac{1}{N} \|u_n\|^2 - \frac{2}{\mu \lambda N} \mu (C + C \|u_n\|)^{1/\sigma} + [(2\mu N(1 + \ln a) - 1)(C + C \|u_n\|),
\]
where we choose \( a > 0 \) with \( \frac{a^2}{\pi \lambda_1} < \frac{1}{2} \), and the last inequality is justified by (2.7) with \( \sigma < 1 \).

Therefore, \( \{u_n\} \) is a bounded sequence in \( H_0^2(\Omega) \). The proof is complete.

On the basis of Lemma \textbf{3.3} we can prove that the \((PS)_c\) condition is valid for some \( c \) when \( \mu > 0 \).

**Lemma 3.4.** Assume that \( N \geq 5, \mu > 0, \) and \( \lambda \in \mathbb{R} \). If \( c < c(S) \), then \( I \) satisfies the \((PS)_c\) condition, where \( c(S) := \frac{2}{N} S_{\frac{2^*}{2}}^{**} \).

**Proof.** Let \( \{u_n\} \) be a \((PS)_c\) sequence of \( I \). According to Lemma \textbf{3.3} \( \{u_n\} \) is bounded in \( H_0^2(\Omega) \). Consequently, by using the Sobolev embedding one sees that there is a subsequence of \( \{u_n\} \) (which we still denote by \( \{u_n\} \)) such that, as \( n \to \infty \),

\[
\begin{cases}
  u_n \to u \text{ in } H_0^2(\Omega), \\
  u_n \to u \text{ in } L^r(\Omega) \quad (1 \leq r < 2^{**}), \\
  u_n \to u \text{ in } H_0^1(\Omega), \\
  |u_n|^{2^{**}-2} u_n \rightharpoonup |u|^{2^{**}-2} u \text{ in } L^{2^{**}}(\Omega), \\
  u_n \to u \text{ a.e. in } \Omega.
\end{cases}
\tag{3.3}
\]

Next, we are going to prove
\[
\lim_{n \to \infty} \int_{\Omega} u_n^2 \ln u_n^2 \, dx = \int_{\Omega} u^2 \ln u^2 \, dx.
\tag{3.4}
\]
Indeed, since \( u_n \to u \text{ a.e. in } \Omega \) as \( n \to \infty \), we get
\[
u_n^2 \ln u_n^2 \to u^2 \ln u^2 \text{ a.e. in } \Omega \text{ as } n \to \infty.
\tag{3.5}
\]

11
Moreover, combining (2.5) and (2.7) we get
\[ |u_n^2 \ln u_n^2| \leq \frac{1}{e} + \frac{1}{e^\delta} u_n^{2(1+\delta)} \rightarrow \frac{1}{e^\delta} u^{2(1+\delta)} \text{ in } L^1(\Omega) \text{ as } n \rightarrow \infty, \] (3.6)
where \( \delta > 0 \) is chosen to satisfy \( 2(1 + \delta) < 2^{**} \). Then (3.3) follows from (3.5), (3.6) and Lebesgue’s dominated convergence theorem.

To show that \( u_n \rightarrow u \) in \( H_0^2(\Omega) \) as \( n \rightarrow \infty \), set \( w_n = u_n - u \). Then \( \{w_n\} \) is also a bounded sequence in \( H_0^2(\Omega) \). So there exists a subsequence of \( \{w_n\} \) (which we still denoted by \( \{w_n\} \)) such that
\[ \lim_{n \rightarrow \infty} \|w_n\| = l \geq 0. \] (3.7)
We claim that \( l = 0 \). Indeed, by virtue of the weak convergence \( u_n \rightharpoonup u \) in \( H_0^2(\Omega) \), we have
\[ \|u_n\|^2 = \|w_n\|^2 + \|u\|^2 + o_n(1), \quad n \rightarrow \infty. \] (3.8)
From the boundedness of \( \{u_n\} \) and the Sobolev embedding, we can easily conclude that \( \|u_n\|_{2^{**}} \leq C \). This, together with \( u_n \rightharpoonup u \) a.e. in \( \Omega \), implies that we can apply Brézis-Lieb’s lemma to obtain
\[ \|u_n\|_{2^{**}}^2 = \|w_n\|_{2^{**}}^2 + \|u\|_{2^{**}}^2 + o_n(1), \quad n \rightarrow \infty. \] (3.9)
Therefore, in accordance with (3.3), (3.4), (3.8), (3.9) and the assumption that \( I'(u_n) \rightarrow 0 \) in \( H^{-2}(\Omega) \) as \( n \rightarrow \infty \), we have
\[ o_n(1) = \langle I'(u_n), u_n \rangle = \langle I'(u), u \rangle + \|w_n\|_{2^{**}}^2 - \|w_n\|_{2^{**}}^2 + o_n(1), \quad n \rightarrow \infty, \]
and for all \( \phi \in H_0^2(\Omega) \),
\[ o_n(1) = \langle I'(u_n), \phi \rangle = \langle I'(u), \phi \rangle + o_n(1), \quad n \rightarrow \infty, \]
which implies that \( u \) is a weak solution to problem (1.1). Combining the above two equalities, and taking \( \phi = u \), one obtains
\[ \langle I'(u), u \rangle = 0, \] (3.10)
and
\[ \|w_n\|^2 - \|w_n\|_{2^{**}}^2 = o_n(1), \quad n \rightarrow \infty. \] (3.11)
In addition, by the Sobolev embedding one has
\[ \|w_n\|_{2^{**}}^2 \leq S^{-\frac{2^{**}}{2^{**}}} \|w_n\|_{2^{**}}^{2^{**}} < C, \quad \forall \ n \in \mathbb{N}. \] (3.12)
In view of (3.3), (3.11) and (3.12), it is easy to see that there is a subsequence of \( \{w_n\} \) such that
\[ \lim_{n \rightarrow \infty} \|w_n\|_{2^{**}} = \lim_{n \rightarrow \infty} \|w_n\|^2 = l \geq 0. \] (3.13)
Letting \( n \rightarrow \infty \) in (3.12), we have \( l \leq S^{-\frac{2^{**}}{2^{**}}} S^{\frac{2^{**}}{2^{**}}}. \) If \( l > 0 \), then
\[ l \geq S^{\frac{2^{**}}{2^{**}}} = S. \] (3.14)
On one hand, with the help of (3.10), we can derive
\[ I(u) = I(u) - \frac{1}{2} \langle I'(u), u \rangle = \frac{1}{2} \mu \|u\|_2^2 + \frac{2}{N} \|u\|_{2^*}^{2^*} \geq 0, \]
since \( \mu > 0 \).

On the other hand, in view of (3.3), (3.4), (3.8), (3.9) and the fact that \( I(u_n) = c + o_n(1) \) as \( n \to \infty \), we have
\[ o_n(1) + c = I(u_n) = I(u) + \frac{1}{2} \|w_n\|^2 - \frac{1}{2^{*^*}} \|w_n\|_{2^{*^*}}^{2^{*^*}} + o_n(1), \quad n \to \infty. \]
Thus, we can deduce that
\[ I(u) = c - \frac{1}{2} \|w_n\|^2 + \frac{1}{2^{*^*}} \|w_n\|_{2^{*^*}}^{2^{*^*}} + o_n(1), \quad n \to \infty. \]
From this and recalling (3.13) and (3.14) one has
\[ I(u) = c - \left( \frac{1}{2} - \frac{1}{2^{*^*}} \right) l \leq c - \frac{2}{N} S^{\frac{4}{
u}} < 0, \]
a contradiction. Thus, \( \lim_{n \to \infty} \|w_n\|^2 = l = 0 \), i.e., \( u_n \to u \) in \( H_0^2(\Omega) \) as \( n \to \infty \). The proof is complete.

The case \( \mu < 0 \) is quite different from the case \( \mu > 0 \) since we can not check the \((PS)_c\) condition in general. However, we can still obtain a nontrivial weak solution by apply the Mountain Pass Lemma without \((PS)_c\) condition.

**Lemma 3.5.** Assume that \( N \geq 5, \mu < 0, \lambda \in \mathbb{R} \) and \( c \in (-\infty, 0) \cup (0, c(S)) \), where \( c(S) \) is given in Lemma 3.4. If \( \{u_n\} \) is a \((PS)_c\) sequence of \( I \), then there exists a \( u \in H_0^2(\Omega) \setminus \{0\} \) such that \( u_n \to u \) in \( H_0^2(\Omega) \) as \( n \to \infty \) and \( u \) is a nontrivial weak solution to problem (1.1).

**Proof.** From Lemma 3.3, we know that \( \{u_n\} \) is bounded in \( H_0^2(\Omega) \). Therefore, (3.3) and (3.4) are valid. As was done in proving Lemma 3.4, set \( w_n = u_n - u \). Then \( \{w_n\} \) is bounded in \( H_0^2(\Omega) \), and there exists a subsequence of \( \{w_n\} \), still denoted by \( \{w_n\} \), such that
\[ \lim_{n \to \infty} \|w_n\|^2 = l \geq 0. \]
In view of (3.3) and Brézis-Lieb’s lemma, we know that (3.8) and (3.9) are still valid. From the definition of the \((PS)_c\) sequence, we have, as \( n \to \infty \),
\[ I'(u_n) \to 0 \text{ in } H^{-2}(\Omega), \quad I(u_n) \to c. \quad (3.15) \]
This, together with (3.8), (3.9) and (3.15), shows that, for any \( \phi \in H_0^2(\Omega) \),
\[ o_n(1) = \langle I'(u_n), \phi \rangle = \langle I'(u), \phi \rangle + o_n(1), \quad n \to \infty, \]
i.e., \( u \) is a weak solution to problem (1.1).

Next, we claim that \( u \neq 0 \). Assume on the contrary that \( u = 0 \). Following from (3.8), (3.14), (3.9) and (3.15), we have
\[ o_n(1) = \langle I'(u_n), u_n \rangle = \|w_n\|^2 - \|w_n\|_{2^{*^*}}^{2^{*^*}} + o_n(1), \quad n \to \infty, \quad (3.16) \]
and
\[ o_n(1) + c = I(u_n) = \frac{1}{2} \|w_n\|^2 - \frac{1}{2^{**}} \|w_n\|^{2^{**}} + o_n(1), \quad n \to \infty. \] (3.17)

It then follows from (3.16) that there is a subsequence of \( \{w_n\} \) such that
\[
\lim_{n \to \infty} \|w_n\|^{2^{**}} = \lim_{n \to \infty} \|w_n\|^2 = l \geq 0.
\]

Letting \( n \to \infty \) in (3.12), we also have \( l \leq S^{-\frac{2}{N}} I^{2^{**}} \). In what follows, we are going to show that \( l > 0 \). In fact, if \( l = 0 \), one has
\[
\lim_{n \to \infty} \|w_n\|^{2^{**}} = \lim_{n \to \infty} \|w_n\|^2 = 0.
\]

This, together with (3.17), implies that \( I(u_n) \to 0 \) as \( n \to \infty \), which contradicts with the assumption that \( c \neq 0 \). Therefore, \( l > 0 \) and (3.14) still holds. Letting \( n \to \infty \) in (3.17) and recalling (3.14), one has
\[ c = \left( \frac{1}{2} - \frac{1}{2^{**}} \right) l \geq \frac{2}{N} S^\frac{N}{4}, \]
a contradiction. Therefore, \( u \) is a nontrivial weak solution to problem (1.1). This completes the proof.

The successful application of the Mountain Pass Lemma in proving the existence of weak solutions is based on the following lemma.

**Lemma 3.6.** Assume that \( N \geq 5 \) and \((\lambda, \mu) \in A \cup B \cup C\). If there exists a \( u^* \in H^2_0(\Omega) \setminus \{0\} \) such that
\[ \sup_{t \geq 0} I(tu^*) < c(S), \] (3.18)
where \( c(S) \) is given in Lemma 3.4, then problem (1.1) possesses a nontrivial weak solution.

**Proof.** From Lemma 3.2, one sees that \( I \) has a mountain pass geometry around 0 if \((\lambda, \mu) \in A \cup B \cup C\). Thus, according to the Mountain Pass Lemma without \((PS)_c\) condition stated in Lemma 2.1, there exists a sequence \( \{u_n\} \subset H^2_0(\Omega) \) such that \( I(u_n) \to c_0 \) and \( I'(u_n) \to 0 \) in \( H^{-2}(\Omega) \) as \( n \to \infty \), where
\[ 0 < \beta \leq c_0 = \inf_{\gamma \in \Gamma} \max_{t \in [0,1]} I(\gamma(t)) \text{ and } \Gamma = \{ \gamma \in C([0,1], H^2_0(\Omega)) : \gamma(0) = 0, \gamma(1) = t_u^* u^* \}, \] (3.19)
and \( t_u^* > 0 \) is determined in the proof of Lemma 3.2 such that \( I(t_u^* u^*) < 0 \). According to the assumption (3.18), we have
\[ c_0 \leq \max_{t \in [0,1]} I(tt_u^* u^*) \leq \sup_{t \geq 0} I(tu^*) < c(S). \] (3.20)

Next, we are going to prove the existence of nontrivial weak solutions to problem (1.1). When \( \mu > 0 \), according to (3.20) and Lemma 3.4, we know that there exists a convergent subsequence of \( \{u_n\} \), still denoted by \( \{u_n\} \), such that \( u_n \to u \) in \( H^2_0(\Omega) \) as \( n \to \infty \), which implies that \( I(u) = c_0 \) and \( I'(u) = 0 \), i.e., \( u \) is a mountain pass type solution to problem (1.1). When \( \mu < 0 \), following from (3.20) and Lemma 3.5, it is easy to see that problem (1.1) possesses a nontrivial weak solution. The proof is complete. \( \square \)
4 Proofs of the main results

In view of Lemma 3.6, one sees that it is sufficient to find \( u^* \in H^2_0(\Omega) \) satisfying (3.18) to show the existence of weak solutions to problem (1.1). Inspired by Brezis and Nirenberg [8] and Deng et al. [10], we shall do this with the help of the truncated Talenti functions. Without loss of generality, we may assume that \( 0 \in \Omega \) is the geometric center of \( \Omega \). Thus, \( \rho_{\text{max}} = \text{dist}(0, \partial \Omega) \).

For any \( \varepsilon > 0 \), define

\[
U_\varepsilon(x) = C_N \frac{\varepsilon^{n-4}}{(\varepsilon^2 + |x|^2)^{\frac{n-4}{2}}}, \quad x \in \mathbb{R}^N,
\]

(4.1)

where \( C_N = \left[ \frac{N(N-4)(N^2-4)}{N} \right]^{\frac{N-4}{2}} \). Then \( U_\varepsilon(x) \) is a solution of the critical problem

\[
\Delta^2 u = u^{2^*-1}, \quad x \in \mathbb{R}^N, \quad N \geq 5,
\]

and \( \|U_\varepsilon\|^2 = \|U_\varepsilon\|_{2^*}^{2^*} = S_N^* \), where \( S = \inf_{u \in H^2_0(\Omega) \setminus \{0\}} \|u\|^2 = \|U_\varepsilon\|^2 = \|U_\varepsilon\|_{2^*}^{2^*} \).

We have the following estimates on the Talenti functions with a cut-off function (see [15]).

**Lemma 4.1.** Assume that \( N \geq 5 \). Let \( \varphi \in C_0^\infty(\Omega) \) be a cut-off function such that \( \varphi(x) = \varphi(|x|), \ 0 \leq \varphi(x) \leq 1 \) for \( x \in \Omega \), and

\[
\varphi(x) = \begin{cases} 
1, & |x| < \rho, \\
0, & |x| > 2\rho, 
\end{cases}
\]

where \( \rho > 0 \) is a constant such that \( B_{2\rho}(0) \subset \Omega \). Set \( u_\varepsilon(x) = \varphi(x) U_\varepsilon(x) \). Suppose that \( \varepsilon \to 0 \).

Then

\[
\|u_\varepsilon\|^2 = S_N^* + O(\varepsilon^{N-4}),
\]

\[
\|u_\varepsilon\|_{2^*}^{2^*} = S_N^* + O(\varepsilon^N).
\]

In what follows, by carefully estimating each term of \( \psi_{u_\varepsilon}(t) \) we shall verify that (3.18) holds with \( u^* = u_\varepsilon \) for suitable \( \varepsilon \). The discussion will be divided into three cases, i.e., \( N = 9, N = 8 \) and \( N = 5, 6, 7 \).

4.1 The case \( N \geq 9 \).

**Lemma 4.2.** If \( N \geq 9 \), then, as \( \varepsilon \to 0 \),

\[
\|u_\varepsilon\|^2_2 = C_N^2 \varepsilon^4 \int_{\mathbb{R}^N} \frac{1}{(1 + |y|^2)^{N-4}} \, dy + O(\varepsilon^{N-4}),
\]

(4.2)

and

\[
\int_{\Omega} u_\varepsilon^2 \ln u_\varepsilon^2 \, dx = (N-4)C_N^2 \varepsilon^4 \ln \frac{1}{\varepsilon} \int_{\mathbb{R}^N} \frac{1}{(1 + |y|^2)^{N-4}} \, dy + O(\varepsilon^4).
\]

(4.3)

**Proof.** Using (1.1), the properties of the cut-off function \( \varphi \), change of variable, and polar coordinates transformation, we have

\[
\|u_\varepsilon\|^2 = \int_{\Omega} \varphi^2 U_\varepsilon^2 \, dx
\]
where we have used the fact that
\[
\int_{B_{2\rho}} \frac{\varepsilon^{N-4}}{(\varepsilon^2 + |x|^2)^{N-4}} \, dx + \int_{B_{2\rho}\setminus B_\rho} \varepsilon^{N-4} \, dx
\]
\[= C_N^2 \int_{B_{2\rho}} \frac{\varepsilon^{N-4}}{(\varepsilon^2 + |x|^2)^{N-4}} \, dx + \int_{B_{2\rho}\setminus B_\rho} \frac{\varepsilon^{N-4}}{(\varepsilon^2 + |x|^2)^{N-4}} \, dx
\]
\[= C_N^2 \int_{B_{2\rho}} \frac{\varepsilon^{N-4}}{(\varepsilon^2 + |x|^2)^{N-4}} \, dy + O(\varepsilon^{N-4})
\]
\[= C_N^2 \varepsilon^4 \int_{\mathbb{R}^N} \frac{1}{(1 + |y|^2)^{N-4}} \, dy + O(\varepsilon^{N-4}),
\]
where we have used the fact that
\[
\int_{B_{2\rho}} \frac{\varepsilon^{N-4}}{(\varepsilon^2 + |x|^2)^{N-4}} \, dx \leq \varepsilon^{N-4} \int_{B_{2\rho}} \frac{1}{|x|^{2(N-4)}} \, dx = O(\varepsilon^{N-4}),
\]
and
\[
\int_{B_\rho} \frac{1}{(1 + |y|^2)^{N-4}} \, dy = \omega_N \int_0^{+\infty} \frac{r^{N-1}}{(1 + r^2)^{N-4}} \, dr \leq \omega_N \int_0^{+\infty} \frac{1}{r^{N-7}} \, dr = O(\varepsilon^{-8}). \tag{4.4}
\]
This shows (4.2).

Next we prove (1.3). According to the definition of \(u_\varepsilon\), we have
\[
\int_{\Omega} u_\varepsilon^2 \ln u_\varepsilon^2 \, dx = \int_{\Omega} \varepsilon^2 \ln(\varepsilon^2 U_\varepsilon^2) \, dx = \int_{\Omega} U_\varepsilon^2 \varphi^2 \ln \varphi^2 \, dx + \int_{\Omega} \varphi^2 U_\varepsilon^2 \ln U_\varepsilon^2 \, dx := I + II. \tag{4.5}
\]
To calculate \(I\) and \(II\), we first estimate \(\int_{B_{2\rho}\setminus B_\rho} U_\varepsilon^{2k} \, dx\) with \(\frac{N}{2(N-4)} < k < 1\) and \(k \geq 1\), respectively. When \(\frac{N}{2(N-4)} < k < 1\), one has
\[
\int_{B_{2\rho}\setminus B_\rho} U_\varepsilon^{2k} \, dx = C_N^{2k} \int_{B_{2\rho}\setminus B_\rho} \frac{\varepsilon^{k(N-4)}}{(\varepsilon^2 + |x|^2)^{k(N-4)}} \, dx
\]
\[= C_N^{2k} \omega N \varepsilon^{N-k(N-4)} \int_{B_\rho} \frac{y^{N-1}}{1 + y^2)^{k(N-4)}} \, dy \leq C_N^{2k} \omega N \varepsilon^{N-k(N-4)} \int_0^{+\infty} \frac{y^{N-1}}{1 + y^2)^{k(N-4)}} \, dy
\]
\[= O(\varepsilon^4). \tag{4.6}
\]
When \(k \geq 1\), we deduce that
\[
\int_{B_{2\rho}\setminus B_\rho} U_\varepsilon^{2k} \, dx = C_N^{2k} \int_{B_{2\rho}\setminus B_\rho} \frac{\varepsilon^{k(N-4)}}{(\varepsilon^2 + |x|^2)^{k(N-4)}} \, dx \leq C_N^{2k} \varepsilon^{k(N-4)} \int_{B_{2\rho}\setminus B_\rho} \frac{1}{|x|^{2k(N-4)}} \, dx
\]
\[= O(\varepsilon^4). \tag{4.7}
\]
By recalling the fact that \(0 \leq \varphi \leq 1\) with (2.5) and applying (4.7) with \(k = 1\), we have
\[
|I| \leq \frac{1}{c} \int_{B_{2\rho}\setminus B_\rho} U_\varepsilon^2 \, dx = O(\varepsilon^4). \tag{4.8}
\]
Set
\[
II = \int_{B_\rho} U_\varepsilon^2 \ln U_\varepsilon^2 \, dx + \int_{B_{2\rho}\setminus B_\rho} \varphi^2 U_\varepsilon^2 \ln U_\varepsilon^2 \, dx := II_1 + II_2. \tag{4.9}
\]
Using (2.6) with $\delta > 0$ satisfying $\frac{N}{2(\lambda N + 1)} < 1 - \delta < 1$, we have

$$|I_2| \leq \int_{B_{2\rho}} |U^2_{\varepsilon}| \ln U^2_{\varepsilon} |dx \leq C_{\alpha, \delta} \int_{B_{2\rho} \setminus B_{\rho}} (U^2_{\varepsilon}(1 + \alpha) + U^2_{\varepsilon}(1 - \delta)) |dx = O(\varepsilon^4),$$

(4.10)

where the last equality is justified by (4.6) and (4.7). In addition, one has

$$II_1 = C^2_N \int_{B_\rho} \frac{\varepsilon^{N-4}}{(\varepsilon^2 + |x|^2)^{N-4}} \ln \frac{C^2_N \varepsilon^{N-4}}{(\varepsilon^2 + |x|^2)^{N-4}} |dx$$

$$= C^2_N \int_{B_\rho} \frac{\varepsilon^{N-4}}{(1 + |y|^2)^{N-4}} \ln \frac{C^2_N}{(1 + |y|^2)^{N-4}} |dy$$

$$= (N - 4)C^2_N \varepsilon^4 \ln \frac{1}{\varepsilon} \int_{B_\rho} \frac{1}{(1 + |y|^2)^{N-4}} |dy + C^2_N \varepsilon^4 \int_{B_\rho} \frac{1}{(1 + |y|^2)^{N-4}} \ln \frac{C^2_N}{(1 + |y|^2)^{N-4}} |dy$$

$$= (N - 4)C^2_N \varepsilon^4 \ln \frac{1}{\varepsilon} \int_{B_\rho} \frac{1}{(1 + |y|^2)^{N-4}} |dy + O(\varepsilon^4),$$

(4.11)

where we have used (4.4) and the fact that

$$| \int_{B_\rho} \frac{1}{(1 + |y|^2)^{N-4}} \ln \frac{C^2_N}{(1 + |y|^2)^{N-4}} |dy |$$

$$\leq | \ln C^2_N | \int_{B_\rho} \frac{1}{(1 + |y|^2)^{N-4}} |dy + (N - 4) \int_{B_\rho} \frac{1}{(1 + |y|^2)^{N-4}} \ln(1 + |y|^2) |dy$$

$$\leq | \ln C^2_N | \int_{\mathbb{R}^N} \frac{1}{(1 + |y|^2)^{N-4}} |dy + (N - 4) \frac{\alpha}{\varepsilon} \int_{\mathbb{R}^N} \frac{1}{(1 + |y|^2)^{N-4}} |dy$$

$$\leq C.$$

Notice that we have used (2.7) with $\sigma = \frac{1}{4}$ in the last but one inequality. Therefore, in accordance with (4.5), (4.9), (4.10) and (4.11), one obtains (4.3). The proof is complete.

Then, we verify condition (3.18) for $N \geq 9$ with the help of Lemma 4.2

**Lemma 4.3.** If $N \geq 9$, $\mu > 0$ and $\lambda \in \mathbb{R}$, then condition (3.18) holds.

**Proof.** Since $\mu > 0$, for $u_\varepsilon$ given in Lemma 4.1, one has $\lim_{t \to 0} \psi_{u_\varepsilon}(t) = 0$, $\psi_{u_\varepsilon}(t) > 0$ for $t > 0$ suitably small and $\lim_{t \to +\infty} \psi_{u_\varepsilon}(t) = -\infty$ uniformly for $\varepsilon \in (0, \varepsilon_1)$, where $\varepsilon_1 > 0$ is a suitably small but fixed number. Thus, for each $\varepsilon \in (0, \varepsilon_1)$, there exists a $t_\varepsilon \in (0, +\infty)$ such that

$$\sup_{t \geq 0} I(tu_\varepsilon) = \sup_{t \geq 0} \psi_{u_\varepsilon}(t) = \psi_{u_\varepsilon}(t_\varepsilon),$$

17
and

\[ 0 = \psi'_{u_\varepsilon}(t_\varepsilon) = t_\varepsilon(\|u_\varepsilon\|^2 - \lambda \|u_\varepsilon\|^2 - \mu \int_\Omega u_\varepsilon^2 \ln(t_\varepsilon u_\varepsilon)^2 dx - t_\varepsilon^{2^* - 2} \|u_\varepsilon\|^{2^*}) \]

that is

\[ \|u_\varepsilon\|^2 - \lambda \|u_\varepsilon\|^2 - \mu \int_\Omega u_\varepsilon^2 \ln(u_\varepsilon)^2 dx = t_\varepsilon^{2^* - 2} \|u_\varepsilon\|^{2^*} + \mu \|u_\varepsilon\|^2 \ln t_\varepsilon. \]  

(4.12)

We first show that there exist 0 < T_0 < T^0 such that T_0 \leq t_\varepsilon \leq T^0 for all suitably small \varepsilon. From (4.12), Lemmas 4.1 and 4.2 one has, for suitably small \varepsilon,

\[ 2S_\varepsilon^{\frac{\lambda}{2}} \geq \frac{1}{2} S_\varepsilon^{\frac{\lambda}{2}} t_\varepsilon^{2^{*} - 2} - C|\ln t_\varepsilon|, \]

which implies that t_\varepsilon is bounded from above. On the other hand, by (4.12), Lemmas 4.1, 4.2 and making use of (2.7) with \varepsilon = 1, one also has

\[ \frac{1}{2} S_\varepsilon^{\frac{\lambda}{2}} \leq 2S_\varepsilon^{\frac{\lambda}{2}} t_\varepsilon^{2^{*} - 2} + Ct_\varepsilon^2, \]

which implies that t_\varepsilon is bounded from below by some positive constant.

Set

\[ h(t) := \frac{1}{2} t^2 \|u_\varepsilon\|^2 - \frac{1}{2^{*^{2}}} t^{2^{*}} \|u_\varepsilon\|^{2^{*}}, \quad t > 0. \]  

(4.13)

Direct computation shows that h takes its maximum at \( t^*_\varepsilon := \left( \frac{\|u_\varepsilon\|^2}{\|u_\varepsilon\|^{2^{*}}} \right)^{\frac{\lambda - 4}{2}} \) and by Lemma 4.1 one has

\[ h(t^*_\varepsilon) = \frac{2}{N} \left( \frac{\|u_\varepsilon\|^2}{\|u_\varepsilon\|^{2^{*}}} \right)^{\frac{\lambda}{2}} \geq \frac{2}{N} S_\varepsilon^{\frac{\lambda}{2^*}} + O(\varepsilon^{N-4}), \quad \varepsilon \to 0. \]  

(4.14)

Thus, in view of (4.14), Lemma 4.2 and recalling T_0 < t_\varepsilon < T^0 and \mu > 0, one sees, for \varepsilon small enough, that

\[
\begin{align*}
\sup_{t \geq 0} I(tu_\varepsilon) &= h(t_\varepsilon) - \frac{1}{2} \lambda t^2_\varepsilon \|u_\varepsilon\|^2_2 - \frac{1}{2} \mu t^2_\varepsilon \|u_\varepsilon\|^2_2 - \frac{1}{2} \mu \|u_\varepsilon\|^2_2 t^2_\varepsilon \ln t^2_\varepsilon - \frac{1}{2} \mu t^2_\varepsilon \int_\Omega u_\varepsilon^2 \ln u_\varepsilon ^2 dx \\
&\leq h(t^*_\varepsilon) - \frac{1}{2} \lambda t^2_\varepsilon \|u_\varepsilon\|^2_2 - \frac{1}{2} \mu t^2_\varepsilon (\ln t^2_\varepsilon - 1) \|u_\varepsilon\|^2_2 - \frac{1}{2} \mu t^2_\varepsilon \int_\Omega u_\varepsilon^2 \ln u_\varepsilon ^2 dx \\
&\leq \frac{2}{N} S^{\frac{\lambda}{2^*}} + O(\varepsilon^{4}) - C \mu \varepsilon^{4} \ln \frac{1}{\varepsilon} \\
&< \frac{2}{N} S^{\frac{\lambda}{2^*}}.
\end{align*}
\]

Fix such an \varepsilon > 0 and take \( u_* = u_\varepsilon \). The proof is complete. \( \Box \)

4.2 The case \( N = 8 \).

**Lemma 4.4.** If \( N = 8 \), then, as \( \varepsilon \to 0 \),

\[ \|u_\varepsilon\|^2_2 = 1920 \omega_8 \varepsilon^4 \ln \frac{1}{\varepsilon} + O(\varepsilon^4), \]

(4.15)
\[
\int_{\Omega} u_\varepsilon^2 \ln u_\varepsilon^2 \, dx \geq 1920 \omega_8 \varepsilon^4 \ln \frac{1}{\varepsilon} \ln \left( \frac{1920(\varepsilon^2 + \rho^2)^2}{(\varepsilon^2 + 4\rho^2)^4} \right) + O(\varepsilon^4),
\]
(4.16)

and
\[
\int_{\Omega} u_\varepsilon^2 \ln u_\varepsilon^2 \, dx \leq 1920 \omega_8 \varepsilon^4 \ln \frac{1}{\varepsilon} \ln \left( \frac{1920 \varepsilon^2 (\varepsilon^2 + 4\rho^2)^2}{(\varepsilon^2 + \rho^2)^4} \right) + O(\varepsilon^4).
\]
(4.17)

**Proof.** By definition
\[
\|u_\varepsilon\|^2 = 1920 \int_{B_\rho} \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \, dx + 1920 \int_{B_{2\rho} \setminus B_\rho} \varphi^2 \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \, dx := I + II,
\]
(4.18)

where
\[
|II| \leq 1920 \int_{B_{2\rho} \setminus B_\rho} \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \, dx \leq 1920 \varepsilon^4 \int_{B_{2\rho} \setminus B_\rho} \frac{1}{|x|^8} \, dx = O(\varepsilon^4),
\]
(4.19)

and
\[
I = \frac{1920}{2} \omega_8 \varepsilon^4 \int_0^\rho \frac{\varepsilon^6}{(\varepsilon^2 + r^2)^4} \, d(\varepsilon^2 + r^2)
\]
\[
= \frac{1920}{2} \omega_8 \varepsilon^4 \int_0^\rho \left[ \frac{1}{\varepsilon^2 + r^2} - \frac{3\varepsilon^2}{(\varepsilon^2 + r^2)^2} + \frac{3\varepsilon^4}{(\varepsilon^2 + r^2)^3} - \frac{\varepsilon^6}{(\varepsilon^2 + r^2)^4} \right] \, d(\varepsilon^2 + r^2)
\]
\[
= \frac{1920}{2} \omega_8 \varepsilon^4 \left[ \ln(\varepsilon^2 + r^2) + \frac{3\varepsilon^2}{\varepsilon^2 + r^2} - \frac{3\varepsilon^4}{2(\varepsilon^2 + r^2)^2} + \frac{\varepsilon^6}{3(\varepsilon^2 + r^2)^3} \right]_0^\rho
\]
\[
= 1920 \omega_8 \varepsilon^4 \ln \frac{1}{\varepsilon} + \frac{1920}{2} \omega_8 \varepsilon^4 \left[ \ln(\varepsilon^2 + \rho^2) + \frac{3\varepsilon^2}{\varepsilon^2 + \rho^2} - \frac{3\varepsilon^4}{2(\varepsilon^2 + \rho^2)^2} + \frac{\varepsilon^6}{3(\varepsilon^2 + \rho^2)^3} - \frac{11}{6} \right]
\]
\[
= 1920 \omega_8 \varepsilon^4 \ln \frac{1}{\varepsilon} + O(\varepsilon^4).
\]
(4.20)

From (4.18), (4.19) and (4.20), we immediately obtain (4.15).

Now, we are going to estimate the logarithmic term. Notice that
\[
\int_{\Omega} u_\varepsilon^2 \ln u_\varepsilon^2 \, dx = 1920 \int_{\Omega} \varphi^2 \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \ln \left( 1920 \varphi^2 \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \right) \, dx
\]
\[
= 1920 \int_{B_{2\rho}} \varphi^2 \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \ln \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \, dx + 1920 \ln(1920) \int_{B_{2\rho}} \varphi^2 \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \, dx
\]
\[
+ 1920 \int_{B_{2\rho} \setminus B_\rho} \varphi^2 \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \ln \varphi^2 \, dx := I_1 + I_2 + I_3.
\]
(4.21)

Recalling (2.5), one has
\[
|I_3| \leq \frac{1920}{e} \int_{B_{2\rho} \setminus B_\rho} \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \, dx \leq \frac{1920}{e} \varepsilon^4 \int_{B_{2\rho} \setminus B_\rho} \frac{1}{|x|^8} \, dx = O(\varepsilon^4).
\]
(4.22)

It follows from (4.20) and (4.22) that
\[
I_2 = 1920 \ln(1920) \int_{B_\rho} \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \, dx + 1920 \ln(1920) \int_{B_{2\rho} \setminus B_\rho} \varphi^2 \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \, dx
\]

Applying similar argument to the proof of (4.20), one has
\[= 1920 \ln(1920) \omega_k \varepsilon^4 \ln \frac{1}{\varepsilon} + O(\varepsilon^4). \tag{4.23} \]

In addition, by a direct computation, we have
\[
I_1 = 1920 \int_{B_{2\rho}} \varphi^2 \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \ln \frac{1}{\varepsilon} \left[ 1 + \left( \frac{|x|}{\varepsilon} \right)^2 \right] \, dx
\]
\[= 4 \cdot 1920 \ln \frac{1}{\varepsilon} \int_{B_{2\rho}} \varphi^2 \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \, dx - 4 \cdot 1920 \int_{B_{2\rho}} \varphi^2 \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \ln \left[ 1 + \left( \frac{|x|}{\varepsilon} \right)^2 \right] \, dx
\]
\[:= I_{11} + I_{12}. \tag{4.24} \]

Applying similar argument to the proof of (4.20), one has
\[
I_{11} \geq 4 \cdot 1920 \ln \frac{1}{\varepsilon} \int_{B_{2\rho}} \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \, dx
\]
\[= 4 \cdot 1920 \omega_k \varepsilon^4 \ln \frac{1}{\varepsilon} \left\{ \ln \frac{1}{\varepsilon} + \frac{1}{2} \ln(\varepsilon^2 + \rho^2) + \frac{3 \varepsilon^2}{\varepsilon^2 + \rho^2} - \frac{3 \varepsilon^4}{2(\varepsilon^2 + \rho^2)^2} + \frac{\varepsilon^6}{3(\varepsilon^2 + \rho^2)^3} - \frac{11}{6} \right\}
\]
\[= 4 \cdot 1920 \omega_k \varepsilon^4 \left( \ln \frac{1}{\varepsilon} \right)^2 + 2 \cdot 1920 \omega_k \varepsilon^4 \ln \frac{1}{\varepsilon} \ln \frac{\varepsilon^2 + \rho^2}{\varepsilon^4} + O(\varepsilon^6 \ln \frac{1}{\varepsilon}), \tag{4.25} \]

and
\[
I_{11} \leq 4 \cdot 1920 \ln \frac{1}{\varepsilon} \int_{B_{2\rho}} \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \, dx
\]
\[= 4 \cdot 1920 \omega_k \varepsilon^4 \ln \frac{1}{\varepsilon} \left\{ \ln \frac{1}{\varepsilon} + \frac{1}{2} \ln(\varepsilon^2 + \rho^2) + \frac{3 \varepsilon^2}{\varepsilon^2 + 4\rho^2} - \frac{3 \varepsilon^4}{2(\varepsilon^2 + 4\rho^2)^2} + \frac{\varepsilon^6}{3(\varepsilon^2 + 4\rho^2)^3} - \frac{11}{6} \right\}
\]
\[= 4 \cdot 1920 \omega_k \varepsilon^4 \left( \ln \frac{1}{\varepsilon} \right)^2 + 2 \cdot 1920 \omega_k \varepsilon^4 \ln \frac{1}{\varepsilon} \ln \frac{\varepsilon^2 + 4\rho^2}{\varepsilon^4} + O(\varepsilon^6 \ln \frac{1}{\varepsilon}). \tag{4.26} \]

On the other hand,
\[
I_{12} \geq -4 \cdot 1920 \int_{B_{2\rho}} \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \ln \left[ 1 + \left( \frac{|x|}{\varepsilon} \right)^2 \right] \, dx
\]
\[= -2 \cdot 1920 \omega_k \varepsilon^4 \int_0^{2\rho} \frac{r^6}{(1 + r^2)^4} \ln(1 + r^2) \, d(1 + r^2)
\]
\[= -2 \cdot 1920 \omega_k \varepsilon^4 \int_0^{2\rho} \left[ \frac{1}{1 + r^2} - \frac{3}{(1 + r^2)^2} + \frac{3}{(1 + r^2)^3} - \frac{1}{(1 + r^2)^4} \right] \ln(1 + r^2) \, d(1 + r^2)
\]
\[\geq -2 \cdot 1920 \omega_k \varepsilon^4 \int_0^{2\rho} \left[ \frac{1}{1 + r^2} + \frac{3}{(1 + r^2)^3} \right] \ln(1 + r^2) \, d(1 + r^2)
\]
\[\geq -2 \cdot 1920 \omega_k \varepsilon^4 \int_0^{2\rho} \left[ \frac{1}{1 + r^2} \ln(1 + r^2) + \frac{3}{1 + r^2} \right] \, d(1 + r^2)
\]
\[= -2 \cdot 1920 \omega_k \varepsilon^4 \left[ \frac{1}{2} \ln(1 + r^2)^2 + 3 \ln(1 + r^2) \right] \Bigg|_0^{2\rho}
\]
\[= -2 \cdot 1920 \omega_k \varepsilon^4 \left\{ \frac{1}{2} \left[ \ln(\varepsilon^2 + 4\rho^2) + 2 \ln \frac{1}{\varepsilon} \right]^2 + 3 \left[ \ln(\varepsilon^2 + 4\rho^2) + 2 \ln \frac{1}{\varepsilon} \right] \right\} \]
\[ I_{12} \leq -4 \cdot 1920 \int_{B_{\rho}} \frac{\varepsilon^4}{(\varepsilon^2 + |x|^2)^4} \ln \left[ 1 + \left( \frac{|x|}{\varepsilon} \right)^2 \right] dx \]

Therefore, from \((4.21)-(4.23)\), we conclude that

\[ u^2 \ln u^2 dx \geq 4 \cdot 1920 \omega \varepsilon^4 \left( \ln \frac{1}{\varepsilon} \right)^2 + 2 \cdot 1920 \omega \varepsilon^4 \ln \frac{1}{\varepsilon} \ln \frac{\varepsilon^2 + \rho^2}{\varepsilon^2 + \rho^2} + O(\varepsilon^6 \ln \frac{1}{\varepsilon}) \]

\[ - 4 \cdot 1920 \omega \varepsilon^4 \left( \ln \frac{1}{\varepsilon} \right)^2 - 4 \cdot 1920 \omega \varepsilon^4 \ln \frac{1}{\varepsilon} \ln \left[ e^3 (\varepsilon^2 + 4\rho^2) \right] + O(\varepsilon^4) \]

\[ + 1920 \ln(1920) \omega \varepsilon^4 \ln \frac{1}{\varepsilon} + O(\varepsilon^4) \]

\[ = 1920 \omega \varepsilon^4 \ln \frac{1}{\varepsilon} \ln \left( \frac{1920 (\varepsilon^2 + \rho^2)^3}{\varepsilon^2 + \rho^2} \right) + O(\varepsilon^4), \]
With Lemma 4.4 at hand, we will verify condition (3.18) for \( N = 8 \) under appropriate assumptions on \( \lambda, \mu \) and \( \Omega \).

**Lemma 4.5.** Assume that \( N = 8 \). If \((\lambda, \mu) \in A\) or \((\lambda, \mu) \in B \cup C\) with \( \frac{25 \cdot 1920 e^{\frac{3}{2} + \frac{3}{4} \rho}}{\mu^4_{\text{max}}} < 1 \), then (3.18) holds.

**Proof.** As in the proof of Lemma 4.3 one has \( \lim_{t \to 0} \psi_u(t) = 0 \) and \( \lim_{t \to +\infty} \psi_u(t) = -\infty \) uniformly for \( \varepsilon \in (0, \varepsilon_2) \), where \( \varepsilon_2 > 0 \) is a suitably small but fixed number and \( u_\varepsilon \) is given in Lemma 4.4. This, together with Lemma 3.2, implies that there is a \( t_\varepsilon \in (0, +\infty) \) satisfying (4.12) and

\[
\sup_{t \geq 0} I(t_{u_\varepsilon}) = h(t_{u_\varepsilon}) - \frac{1}{2} \lambda t_\varepsilon^2 \| u_\varepsilon \|^2 - \frac{1}{2} \mu \| u_\varepsilon \|^2 t_\varepsilon^2 \ln t_\varepsilon^2 - \frac{1}{2} \mu t_\varepsilon^2 \int_{\Omega} u_\varepsilon^2 \ln u_\varepsilon^2 \, dx, \quad (4.29)
\]

where \( h \) is defined in (4.13). Moreover, there exist \( 0 < T_0 < T^0 \) such that

\[
T_0 < t_\varepsilon < T^0 \quad (4.30)
\]

for both \( \mu > 0 \) and \( \mu < 0 \). Indeed, the boundedness of \( t_\varepsilon \) for \( \mu > 0 \) and the upper bound of \( t_\varepsilon \) for \( \mu < 0 \) can be obtained by similar argument to that of the proof of Lemma 4.3. We only need to show that \( t_\varepsilon > T_0 \) for \( \mu < 0 \). Suppose on the contrary that there exist a sequence \( \{ \varepsilon_n \} \) such that \( \varepsilon_n \to 0 \) and \( t_{\varepsilon_n} \to 0 \) as \( n \to \infty \). For each \( n \), take \( \gamma(1) = t_{u_{\varepsilon_n}} u_{\varepsilon_n} \) in (3.19), where \( t_{u_{\varepsilon_n}} \) is suitably large such that \( I(\gamma(1)) < 0 \). From this, we have

\[
0 < \beta \leq c_0 \leq I(t_{u_{\varepsilon_n}} u_{\varepsilon_n}) \to 0, \quad n \to \infty,
\]

a contradiction. Thus, the positive lower bound of \( t_\varepsilon \) follows and (4.30) is valid.

On the basis of (4.30), we claim that

\[
\| u_\varepsilon \|^2 t_\varepsilon^2 \ln t_\varepsilon^2 = o(\varepsilon^4 | \ln \varepsilon |). \quad (4.31)
\]

Indeed, from (4.13), we have

\[
\| u_\varepsilon \|^2 = O(\varepsilon^4 | \ln \varepsilon |). \quad (4.32)
\]

On the other hand, by (4.30), (4.12), Lemmas 3.1 and 4.4 one has

\[
t_{\varepsilon}^{2^\ast - 2} = \frac{\| u_\varepsilon \|^2 - \lambda \| u_\varepsilon \|^2}{\mu \int_{\Omega} u_\varepsilon^2 \ln u_\varepsilon^2 \, dx - \mu \| u_\varepsilon \|^2 \ln t_\varepsilon^2}{\| u_\varepsilon \|^2}.\quad (4.34)
\]

This completes the proof. \( \square \)
\[\frac{S_N^\mu}{S_N^\mu + O(\varepsilon^4 \ln \frac{1}{\varepsilon})} \to 1, \quad \varepsilon \to 0.\]

Consequently, \(t_\varepsilon^2 \ln t_\varepsilon^2 \to 0\) as \(\varepsilon \to 0\). Combining this with (4.32), one arrives at
\[
\frac{||u_\varepsilon||_2^2 t_\varepsilon^2 \ln t_\varepsilon^2}{\varepsilon^4 |\ln \varepsilon|} = \frac{O(\varepsilon^4 |\ln \varepsilon|) t_\varepsilon^2 \ln t_\varepsilon^2}{\varepsilon^4 |\ln \varepsilon|} \to 0, \quad \varepsilon \to 0,
\]
which implies (4.31).

In what follows, we divide the proof into two cases.

**Case 1:** \(\mu > 0\).

Let \(\rho > 0\) be such that \(\frac{384 e^\frac{\mu}{2} - 24}{125 \rho^4} > 1\) and take \(\varepsilon < \rho\). Following from (3.11), (3.14), (3.15), (4.29), (4.31) and the fact that
\[
\frac{(\varepsilon^2 + \rho^2)^2}{(\varepsilon^2 + 4 \rho^2)^2} > \frac{(\rho^2)^2}{(\rho^2 + 4 \rho^2)^2} = \frac{1}{625 \rho^4},
\]
one obtains
\[
\sup_{t \geq 0} I(t u_\varepsilon) \leq \frac{1}{2} t^2 \int_{\Omega} \left( \frac{\lambda}{\mu} - 1 \right) u_\varepsilon^2 + u_\varepsilon^2 \ln u_\varepsilon^2 \right) dx - \frac{1}{2} \mu ||u_\varepsilon||_2^2 t_\varepsilon^2 \ln t_\varepsilon^2
\]
\[
\leq \frac{2}{N} S_N^\mu + O(\varepsilon^4) - \frac{1}{2} t_\varepsilon^2 \left[ \left( \frac{\lambda}{\mu} - 1 \right) 1920 \omega_8 \varepsilon^4 \ln \frac{1}{\varepsilon} \right.
\]
\[
\left. + 1920 \omega_8 \varepsilon^4 \ln \frac{1}{\varepsilon} \ln \left( \frac{1920 \varepsilon^4 + (\rho^2)^2}{(\varepsilon^2 + 4 \rho^2)^2} \right) + o(\varepsilon^4 |\ln \varepsilon|) \right]
\]
\[
\leq \frac{2}{N} S_N^\mu + O(\varepsilon^4) - \frac{1}{2} t_\varepsilon^2 \left[ 1920 \omega_8 \varepsilon^4 \ln \frac{1}{\varepsilon} \ln \left( \frac{1920 e^\frac{\mu}{2} - 1}{e^\frac{\mu}{2} (\varepsilon^2 + 4 \rho^2)^2} \right) + o(\varepsilon^4 |\ln \varepsilon|) \right]
\]
Recalling that \(\mu > 0\) and \(\frac{384 e^\frac{\mu}{2} - 24}{125 \rho^4} > 1\), we know
\[
\sup_{t \geq 0} I(t u_\varepsilon) < \frac{2}{N} S_N^\mu,\]
for \(\varepsilon\) suitably small. Fix such an \(\varepsilon > 0\) and take \(u^* \equiv u_\varepsilon\). We obtain (5.18).

**Case 2:** \(\mu < 0\).

For this case we fix \(\rho = \rho_{\text{max}}\) and let \(\varepsilon < \rho\). Then, in view of (4.14), (4.15), (4.17), (4.29) and (4.31), one obtains, for \(\varepsilon\) suitably small, that
\[
\sup_{t \geq 0} I(t u_\varepsilon) \leq \frac{1}{2} t^2 \int_{\Omega} \left( \frac{\lambda}{\mu} - 1 \right) u_\varepsilon^2 + u_\varepsilon^2 \ln u_\varepsilon^2 \right) dx - \frac{1}{2} \mu ||u_\varepsilon||_2^2 t_\varepsilon^2 \ln t_\varepsilon^2
\]
\[
\leq \frac{2}{N} S_N^\mu + O(\varepsilon^4) + o(\varepsilon^4 |\ln \varepsilon|)
\]
\[
- \frac{1}{2} t_\varepsilon^2 \left( \frac{\lambda}{\mu} - 1 \right) 1920 \omega_8 \varepsilon^4 \ln \frac{1}{\varepsilon} + 1920 \omega_8 \varepsilon^4 \ln \frac{1}{\varepsilon} \ln \left( \frac{1920 e^\frac{\mu}{2} (\varepsilon^2 + \rho^2)^2}{(\varepsilon^2 + 4 \rho^2)^2} \right)
\]
\[
\leq \frac{2}{N} S^N + O(\varepsilon^4) - \frac{1}{2} \mu \varepsilon^2 \int \frac{1920 \omega \varepsilon^4 \ln \frac{1}{\varepsilon} \ln \left( \frac{1920 \varepsilon^2 + 4 \rho^2}{\rho^4} \right)}{\ln(1 + \varepsilon)} + o(\varepsilon^4 |\ln \varepsilon|)
\]
\[
\leq \frac{2}{N} S^N + O(\varepsilon^4) - \frac{1}{2} \mu C \left( \frac{1920 \varepsilon^2 + 4 \rho^2}{\rho^4} \right) + o(\varepsilon^4 |\ln \varepsilon|),
\]

where we have used the fact that \( \frac{\varepsilon^2 + 4 \rho^2}{\rho^4} < \frac{\varepsilon^2 + 4 \rho^2}{\rho^4} = \frac{25}{\rho^4} \) and \( \mu < 0 \). Noticing that \( \frac{25 \cdot 1920 \varepsilon^2 + 4 \rho^2}{\rho^4} \epsilon_n^* < 1 \), similar to Case 1, one sees that (3.18) holds with \( u^* \equiv u_\varepsilon \) for suitably small \( \varepsilon \). The proof is complete. \( \square \)

### 4.3 The case \( N = 5, 6, 7 \).

**Lemma 4.6.** If \( N = 5, 6, 7 \), then, as \( \varepsilon \to 0 \),

\[
\| u_\varepsilon \|_2^2 = C_5^2 \omega_N \varepsilon N^{-4} \int_0^{2 \rho} \varphi^2 r^{7-N} dr + O(\varepsilon N^{-3}), \tag{4.33}
\]

\[
\int_\Omega u_\varepsilon^2 \ln u_\varepsilon dx = (N - 4) C_5^2 \omega_N \varepsilon N^{-4} \int_0^{2 \rho} \varphi^2 r^{7-N} dr + O(\varepsilon N^{-4}). \tag{4.34}
\]

**Proof.** We first estimate \( \| u_\varepsilon \|_2^2 \) with \( N = 5, 6, 7 \), respectively. When \( N = 5 \), one has

\[
\| u_\varepsilon \|_2^2 = C_5^2 \int_{B_{2 \rho}} \varphi^2 \frac{\varepsilon^2}{\varepsilon^2 + |x|^2} dx = C_5^2 \omega_5 \varepsilon \int_0^{2 \rho} \varphi^2 r^2 \frac{r^2}{\varepsilon^2 + r^2} dr
\]

\[
= C_5^2 \omega_5 \varepsilon \int_0^{2 \rho} \varphi^2 r^2 dr - C_5^2 \omega_5 \varepsilon \int_0^{2 \rho} \varphi^2 r^2 \frac{\varepsilon^2}{\varepsilon^2 + r^2} dr
\]

\[
: = C_5^2 \omega_5 \varepsilon \int_0^{2 \rho} \varphi^2 r^2 dr + I, \tag{4.35}
\]

where

\[
|I| \leq C_5^2 \omega_5 \varepsilon^3 \int_0^{2 \rho} \frac{r^2}{\varepsilon^2 + r^2} dr \leq C_5^2 \omega_5 \varepsilon^3 \int_0^{2 \rho} \frac{r^2}{r^2} dr = O(\varepsilon^3) = O(\varepsilon^2). \tag{4.36}
\]

When \( N = 6 \), one has

\[
\| u_\varepsilon \|_2^2 = C_6^2 \int_{B_{2 \rho}} \varphi^2 \frac{\varepsilon^2}{(\varepsilon^2 + |x|^2)^2} dx = C_6^2 \omega_6 \varepsilon^2 \int_0^{2 \rho} \varphi^2 r^4 \frac{r^4}{(\varepsilon^2 + r^2)^2} dr
\]

\[
= C_6^2 \omega_6 \varepsilon^2 \int_0^{2 \rho} \varphi^2 r dr - C_6^2 \omega_6 \varepsilon^2 \int_0^{2 \rho} \varphi^2 r^2 \frac{\varepsilon^4 + 2 \varepsilon^2 r^2}{(\varepsilon^2 + r^2)^2} dr
\]

\[
: = C_6^2 \omega_6 \varepsilon^2 \int_0^{2 \rho} \varphi^2 r dr + II, \tag{4.37}
\]

where

\[
|II| \leq C_6^2 \omega_6 \varepsilon^2 \int_0^{2 \rho} \frac{\varepsilon^4 r + 2 \varepsilon^2 r^3}{(\varepsilon^2 + r^2)^2} dr
\]
\[
\left| \|u_\varepsilon\|_2 \right|^2 = C_7^2 \int_{B_{2\varepsilon}} \varphi^2 \frac{\varepsilon^3}{(\varepsilon^2 + |x|^2)^3} \, dx = C_7^2 \omega_7 \varepsilon^3 \int_0^{2\varepsilon} \varphi^2 \frac{r^6}{(\varepsilon^2 + r^2)^3} \, dr
\]
\[
= \frac{C^2 \omega_7 \varepsilon^3}{(\varepsilon^2 + r^2)^3} \int_0^{2\varepsilon} \varphi^2 \frac{3 \varepsilon^2}{\varepsilon^2 + r^2} + 3 \frac{\varepsilon^4}{(\varepsilon^2 + r^2)^2} + \frac{\varepsilon^6}{(\varepsilon^2 + r^2)^3} \, dr
\]
\[
\leq C_7^2 \omega_7 \varepsilon^4 \int_0^{+\infty} \left[ \frac{3}{1 + y^2} + \frac{3}{(1 + y^2)^2} + \frac{1}{(1 + y^2)^3} \right] \, dy
\]
\[
= C_7^2 \omega_7 \varepsilon^4 \int_0^{+\infty} \left[ \frac{3}{1 + y^2} + \frac{3}{(1 + y^2)^2} + \frac{1}{(1 + y^2)^3} \right] \, dy
= O(\varepsilon^4).
\]

Therefore, in accordance with (4.33)-(4.40), we obtain (4.33).
\[ := I_1 + I_2 + I_3 + I_4, \quad (4.41) \]

where

\[
|I_1| \leq C_N^2 \ln(C_N^2) \omega_N \varepsilon N^{-4} \int_0^{2\rho} \frac{r^{N-1}}{r^{2(N-4)}} \, dr = C_N^2 \ln(C_N^2) \omega_N \varepsilon N^{-4} \int_0^{2\rho} r^{7-N} \, dr = O(\varepsilon N^{-4}), \quad (4.42)
\]

and in virtue of (2.5),

\[
|I_3| \leq \frac{1}{e} C_N^2 \omega_N \varepsilon N^{-4} \int_0^{2\rho} \frac{r^{N-1}}{(\varepsilon^2 + r^2)^N} \, dr \leq \frac{1}{e} C_N^2 \omega_N \varepsilon N^{-4} \int_0^{2\rho} \frac{r^{N-1}}{r^{2(N-4)}} \, dr = O(\varepsilon N^{-4}). \quad (4.43)
\]

According to (4.39),

\[
I_2 = (N - 4)C_N^2 \omega_N \varepsilon N^{-4} \ln \varepsilon \int_0^{2\rho} \varphi^2 r^{7-N} \, dr + O(\varepsilon N^{-3} \ln \varepsilon). \quad (4.44)
\]

As for \( I_4 \), we set

\[
I_4 = C_N^2 \omega_N \varepsilon N^{-4} \int_0^{\rho} \frac{r^{N-1}}{(\varepsilon^2 + r^2)^N} \ln \frac{1}{(\varepsilon^2 + r^2)^N} \, dr
\]

\[
+ C_N^2 \omega_N \varepsilon N^{-4} \int_\rho^{2\rho} \varphi^2 \frac{r^{N-1}}{(\varepsilon^2 + r^2)^N} \ln \frac{1}{(\varepsilon^2 + r^2)^N} \, dr
\]

\[ := I_{41} + I_{42}. \quad (4.45)\]

Similar to the proof of (4.39), it is shown that

\[
I_{41} = -(N - 4)C_N^2 \omega_N \varepsilon N^{-4} \int_0^{\rho} \frac{r^{N-1}}{(\varepsilon^2 + r^2)^N} \ln(\varepsilon^2 + r^2) \, dr
\]

\[
= -(N - 4)C_N^2 \omega_N \varepsilon N^{-4} \int_0^{\rho} r^{7-N} \left( 1 - \frac{(\varepsilon^2 + r^2)^{N-4} - r^{2N-8}}{(\varepsilon^2 + r^2)^{N-4}} \right) \ln(\varepsilon^2 + r^2) \, dr
\]

\[
= -(N - 4)C_N^2 \omega_N \varepsilon N^{-4} \int_0^{\rho} r^{7-N} \ln(\varepsilon^2 + r^2) \, dr
\]

\[
+ (N - 4)C_N^2 \omega_N \varepsilon N^{-4} \int_\rho^{2\rho} r^{7-N} \frac{(\varepsilon^2 + r^2)^{N-4} - r^{2N-8}}{(\varepsilon^2 + r^2)^{N-4}} \ln(\varepsilon^2 + r^2) \, dr
\]

\[ := I_{411} + I_{412}. \quad (4.46)\]

where

\[
I_{411} = - \frac{1}{N - 4} C_N^2 \omega_N \varepsilon N^{-4} \int_0^{\rho} \ln(\varepsilon^2 + r^2) \, dr^{8-N}
\]

\[
= - \frac{1}{N - 4} C_N^2 \omega_N \varepsilon N^{-4} \left\{ \left[ r^{8-N} \ln(\varepsilon^2 + r^2) \right]_0^{\rho} - \int_0^{\rho} \frac{2r^{9-N}}{\varepsilon^2 + r^2} \, dr \right\}
\]

\[
\leq - \frac{1}{N - 4} C_N^2 \omega_N \varepsilon N^{-4} \left\{ \left[ r^{8-N} \ln(\varepsilon^2 + r^2) \right]_0^{\rho} - \int_0^{\rho} \frac{2r^{9-N}}{\varepsilon^2 + r^2} \, dr \right\}
\]

\[
= - \frac{1}{N - 4} C_N^2 \omega_N \varepsilon N^{-4} \{ \rho^{8-N} \ln(\varepsilon^2 + \rho^2) + O(1) \}
\]

26
= O(\varepsilon^{N-4}). \quad (4.47)

The estimate of \( I_{412} \) will be done separately, depending on \( N \). When \( N = 5 \), by applying (2.7) with \( \sigma = 1 \) and using \( \frac{1}{\varepsilon} < 1 \), we have

\[
|I_{412}| = C_5^2 \omega_5 \varepsilon I_4 \int_0^\rho \frac{r^2}{\varepsilon^2 + r^2} |\ln(\varepsilon^2 + r^2)| dr
\]

\[
= C_5^2 \omega_5 \varepsilon I_4 \int_0^\rho \frac{\varepsilon^2}{\varepsilon^2 + r^2} \ln(\varepsilon^2 + r^2) |dr|
\]

\[
\leq C_5^2 \omega_5 \varepsilon I_4 \int_0^\rho \frac{\varepsilon^2}{\varepsilon^2 + r^2} \ln(\varepsilon^2 + r^2) dr
\]

\[
\leq C_5^2 \omega_5 \varepsilon I_4 \int_0^\rho \frac{\varepsilon^2}{\varepsilon^2 + r^2} \ln(1 + r^2) dr
\]

\[
= C_5^2 \omega_5 \rho \varepsilon^3 |\ln(\varepsilon^2)| + C_5^2 \omega_5 \rho^3 \varepsilon
\]

\[
= O(\varepsilon). \quad (4.48)
\]

When \( N = 6 \), direct computation yields

\[
I_{412} = 2C_6^2 \omega_6 \varepsilon I_4 \int_0^\rho \frac{\varepsilon^4 r^2 + 2\varepsilon^2 r^3}{(\varepsilon^2 + r^2)^2} \ln(\varepsilon^2 + r^2) dr
\]

\[
= C_6^2 \omega_6 \varepsilon I_4 \int_0^\rho \left[ \frac{\varepsilon^4 r^2}{(\varepsilon^2 + r^2)^2} + \frac{2\varepsilon^2 r^2}{(\varepsilon^2 + r^2)^2} \right] \ln(\varepsilon^2 + r^2) dr
\]

\[
= C_6^2 \omega_6 \varepsilon I_4 \int_0^\rho \left[ \frac{\varepsilon^4 r^2}{(\varepsilon^2 + r^2)^2} \ln(\varepsilon^2 + r^2) \right] dr
\]

\[
+ 2C_6^2 \omega_6 \varepsilon I_4 \int_0^\rho \left[ \frac{\varepsilon^2}{(\varepsilon^2 + r^2)^2} \ln(\varepsilon^2 + r^2) \right] dr
\]

\[
= -C_6^2 \omega_6 \varepsilon I_4 \int_0^\rho \left[ \frac{\varepsilon^2}{(\varepsilon^2 + r^2)^2} \ln(\varepsilon^2 + r^2) \right] dr
\]

\[
= O(\varepsilon^2). \quad (4.49)
\]

When \( N = 7 \), by applying (2.7) with \( \sigma = 1 \), one has

\[
|I_{412}| = 3C_7^2 \omega_7 \varepsilon^3 I_4 \int_0^\rho \frac{\varepsilon^6 + 3\varepsilon^4 r^2 + 3\varepsilon^2 r^4}{(\varepsilon^2 + r^2)^3} \ln(\varepsilon^2 + r^2) dr
\]

\[
= 3C_7^2 \omega_7 \varepsilon^4 I_4 \int_0^\rho \left[ \frac{3}{1 + y^2} - \frac{3}{(1 + y^2)^2} + \frac{1}{(1 + y^2)^3} \right] \ln(\varepsilon^2 + r^2) |dy|
\]

\[
\leq 3C_7^2 \omega_7 \varepsilon^4 I_4 |\ln(\varepsilon^2)| \int_0^\rho \left[ \frac{3}{1 + y^2} - \frac{3}{(1 + y^2)^2} + \frac{1}{(1 + y^2)^3} \right] dy
\]
\[ +3C_2^2\omega\varepsilon \int_0^\varepsilon \left[ \frac{3}{1 + y^2} - \frac{3}{(1 + y^2)^2} + \frac{1}{(1 + y^2)^3} \right] \ln(1 + y^2)dy \]
\[ \leq 3C_2^2\omega\varepsilon |\ln \varepsilon| \int_0^{\infty} \left[ \frac{3}{1 + y^2} + \frac{1}{(1 + y^2)^3} \right] dy + 3C_2^2\omega\varepsilon^4 \int_0^\varepsilon 4dy \]
\[ = O(\varepsilon^3). \quad (4.50) \]

In conclusion, from (4.41)-(4.50), we obtain (4.34). The proof is complete. \(\square\)

Now, we are able to verify condition (3.18) for \(N = 5, 6, 7\).

**Lemma 4.7.** Assume that \(N = 5, 6, 7\). If \((\lambda, \mu) \in B \cup C\), then \[(3.18) \text{ holds.}\]

**Proof.** The proof is similar to the proof of Lemma 4.5 and we only sketch the outline. Notice that for \(\varepsilon\) suitable small, we still have there is a \(t_\varepsilon \in (0, +\infty)\) satisfying (4.29) and (4.30). From this, (4.14), and Lemma 4.6, one has
\[ \sup_{t \geq 0} I(tu_\varepsilon) \leq h(t_\varepsilon^*) - \frac{1}{2} \lambda t_\varepsilon^2 \|u_\varepsilon\|^2 - \frac{1}{2} \mu t_\varepsilon^2 (\ln t_\varepsilon^2 + 1) \|u_\varepsilon\|^2 - \frac{1}{2} \mu t_\varepsilon^2 \int_\Omega u_\varepsilon^2 \ln u_\varepsilon^2 dx \]
\[ \leq \frac{2}{N} S^N + O(\varepsilon^{N-4}) - C\mu \varepsilon^{N-4} \ln \varepsilon. \]
Then the conclusion follows by choosing \(u^* \equiv u_\varepsilon\) with suitable small \(\varepsilon\). The proof is complete. \(\square\)

By virtue of the above lemmas, we can establish the existence results for problem (1.1).

**Proof of Theorem 2.1.** (i) When \(N \geq 8\) and \((\lambda, \mu) \in A\), following from Lemmas 3.6 and 4.5, we know that condition (3.18) holds. Consequently, there exists a mountain pass type solution \(u\) to problem (1.1) from Lemma 3.6. Furthermore, in view of Remark 3.1, we know that \(u\) is a ground state solution to problem (1.1).

(ii) When \(N = 8\), \((\lambda, \mu) \in B \cup C\) with \(25 \cdot \frac{1920}{\rho_{\text{max}}^{3/2} + 4} < 1\), it follows from Lemma 4.5 that condition (3.18) is valid. Thus, from Lemma 3.6, we know that there exists a nontrivial weak solution \(u\) to problem (1.1).

(iii) When \(N = 5, 6, 7\) and \((\lambda, \mu) \in B \cup C\), by combining Lemma 3.6 with Lemma 4.7, we know that there exists a nontrivial weak solution \(u\) to problem (1.1). The proof of Theorem 2.1 is complete. \(\square\)

Finally, we give the proof of the nonexistence of positive solutions in the following.

**Proof of Theorem 2.2.** To this end, we assume by contradiction that problem (1.1) admits a positive solution \(u_0\). Let \(\phi_1(x) > 0\) be the first eigenfunction corresponding to \(\lambda_1(\Omega)\). Then, by integrating by parts, one has
\[ \int_\Omega (\lambda + \mu \ln u_0^2 + u_0^{2\gamma-2})u_0\phi_1 dx = \int_\Omega \Delta u_0 \Delta \phi_1 dx = \int_\Omega \phi_1 \Delta^2 u_0 dx = \lambda_1(\Omega) \int_\Omega u_0 \phi_1 dx, \]
or equivalently
\[
\int_{\Omega} \left( \lambda - \lambda_1(\Omega) + \mu \ln u_0^2 + u_0^{2^* - 2} \right) u_0 \phi_1 \, dx = 0.
\]

Set
\[
f(t) := \lambda - \lambda_1(\Omega) + \mu \ln t^2 + t^{2^* - 2}, \quad t > 0,
\]

Direct computation shows that \( f \) attains its minimum at \( \tilde{t} := \left( -\frac{\mu(N-4)}{4} \right)^{\frac{N-4}{8}} \) and
\[
f(t) \geq f(\tilde{t}) = -\frac{\mu(N-4)}{4} + \frac{\mu(N-4)}{4} \ln \left( -\frac{\mu(N-4)}{4} \right) + \lambda - \lambda_1(\Omega) \geq 0,
\]
by assumption. Following from \( u_0 \in H_0^2(\Omega) \) and \( u_0 > 0, \phi_1 > 0 \), we claim that \( \int_{\Omega} f(u_0) u_0 \phi_1 \, dx > 0 \). Otherwise, \( f(u_0) = 0 \) a.e. in \( \Omega \), which implies that \( u_0 = \left( -\frac{\mu(N-4)}{4} \right)^{\frac{N-4}{8}} \) a.e. in \( \Omega \), and this contradicts with the assumption that \( u_0 \in H_0^2(\Omega) \). Thus, we see that
\[
0 = \int_{\Omega} \left( \lambda - \lambda_1(\Omega) + \mu \ln u_0^2 + u_0^{2^* - 2} \right) u_0 \phi_1 \, dx = \int_{\Omega} f(u_0) u_0 \phi_1 \, dx > 0,
\]
a contradiction. Hence problem (1.1) has no positive solutions. This completes the proof.
