Abstract

The antibiotic resistance among gram-positive and gram-negative pathogenic bacteria is of global health concern. This has prompted the development of new effective drugs. But the discovery and development of new drugs is slow, and the emergence of resistance to such new drugs, on the other hand, is rapid as well as continuous among the bacteria. Therefore, in tackling the emergence of antibiotic resistant pathogenic bacteria finding alternative ways is vital. This communication, based on the published scientific data, summarizes the antibacterial capacity of some naturally derived agents such as honey, phytocomponents, probiotics, and antimicrobial peptides that might bring new essence in biomedicine.

Keywords: Bacterial resistance, alternative therapeutics, honey, phytomedicine, probiotics, antimicrobial peptides.

1. Introduction

Emergence of bacterial antibiotic resistance developed through an array of mechanisms is a severe threat to humans, and such phenomenon has been marked as a global alarming problem, which in developing countries including India, as recognised by the WHO, is reaching critical levels. The multidrug resistant (MDR) ESKAPE (gram-positive: Enterococcus faecium and Staphylococcus aureus, and gram-negative: Klebsiella pneumoniae, Acinetobacter baumannii, Pseudomonas aeruginosa, and Enterobacter spp.) bacteria are among the most notorious to cause life threatening nosocomial infections. The continuous antibiotic therapy as well as the lack of effective antibiotics in the existing global treatment regimen has directed to a major upsurge in antibiotic resistance. The increasing trend of development of antibiotic resistance among pathogenic bacteria has been associated with a marked economic cost worldwide. As the consequences there are great mortality and morbidity, high treatment costs, diagnostic doubts, and deficiency of trusted conventional medicine. Of the six notorious ESKAPE pathogens, the four gram-negative bacteria, have been associated with four main types of multi-drug resistance, specifically the extended-spectrum β-lactamase-producing K. pneumoniae and Enterobacter spp., carbapenemase-producing A. baumannii and metallo-β-lactamase producing Ps. aeruginosa limiting the therapeutic choices. K. pneumoniae is presently developing as a noticeable opportunistic pathogen and the most challenging agent of nosocomial infections.

Exposure of the pathogenic bacteria to antibiotics surges the risk of the emergence of carbapenem resistant Enterobacteriaceae, too. Carbapenems and cephalosporins are cause of resistance that increased the risk up to 15-fold and 6-29 folds, respectively. The widespread antibiotic usage in communities and hospitals cause severe multidrug resistance among gram-negative bacteria. The ESBL-mediated MDR gram-negative ESKAPE pathogens are progressively associated with several conditions that are difficult to treat in both developed and developing nations. Current researches have shown pronounced interest in the use of alternative agents including honey, phytomedicine, probiotics, and antimicrobial peptides, in targeting the bacterial resistance corroborating their potential in the treatment of diseases caused by a large number of bacteria displaying resistance to almost all the antibiotics. This study thus provides a highlight on the antibacterial capacity of some naturally available agents, based on the scientific information published in the field.

2. Antibacterial activity

The indiscriminate use of antibiotics causes the development of antibiotic resistance among pathogenic bacteria leading to high morbidity and mortality from infections caused by such pathogens. In the current times, there has been an increasing interest in exploring and evolving new antimicrobial biotherapeutics from various sources to fight bacterial resistances. Along with the growing incidence of antibacterial resistance, complete and effective investigation is needed to look for the natural antibacterial sources, such as honey, plants, probiotics providing several active compounds having antibacterial activity that could inhibit life threatening bacterial diseases (Figure 1).
2.1. Honey

Recently it has been proved experimentally that honey display antibacterial, anti-inflammatory and antioxidant activities, which may be useful in opposing MDR bacteria as well as in inhibiting many prolonged inflammatory processes\(^8\). The antibacterial activity of honey against clinical isolates of *Escherichia coli*, *Pseudomonas aeruginosa* and *Salmonella enterica* serovar Typhi has been reported previously\(^9\). Some factors that present in the honey as antimicrobials include hydrogen peroxide (H\(_2\)O\(_2\)) and inhibin, and also the osmotic effect of honey, its low pH (3.2 – 4.5), defensin-1, as well as the presence of phytochemical components display antibacterial activity\(^10\).

Most of the researchers performed the disc diffusion or well diffusion method to study the antibacterial activity of honey. Several articles on antibacterial activity of different honey samples from diverse region of the world that has been publish are summarised in Table 1.

### Table 1: Antibacterial activity of honey

| Honey type                        | Geographical location | Using condition       | Activity against bacteria                                                                 | Antibacterial activity | Ref |
|-----------------------------------|-----------------------|-----------------------|-------------------------------------------------------------------------------------------|------------------------|-----|
| Commercial grade honey            | Malda, India          | Aqueous honey         | **Gram negative**: *Escherichia coli*, *Pseudomonas aeruginosa*, *Proteus vulgaris*, and *E. coli ATCC 25922*<br>**Gram positive**: *Staphylococcus aureus* | 6 – 30 | ND   | 8   |
| Natural jujube honey              | Saudi Arabia          | Methanol extract      | **Gram negative**: *E. coli ATCC 35218*, *Klebsiella pneumoniae ATCC 700603*, and *K. pneumoniae ATCC 27736*<br>**Gram positive**: *S. aureus ATCC 25923*, *Staphylococcus epidermidis ATCC 12228*, *Enterococcus faecalis ATCC 29212*, *Bacillus cereus ATCC 10876*, | 6 – 17 | ND   | 11  |
| Eucalyptus honey and commercial grade honey | Mauritius            | Undiluted             | **Gram negative**: *Proteus sp., Klebsiella sp.*, *Pseudomonas 161 sp.*, and *E. coli ATCC 25922*, and *Ps. aeruginosa ATCC 27853*<br>**Gram positive**: *Streptococcus sp.*, *S. epidermidis ATCC 35984*, and *S. epidermidis ATCC 14990* | 6 – 28 | ND   | 12  |
Table 1: (Continued)

| Honey type                  | Geographical location | Using condition                  | Activity against bacteria                                                                 | Antibacterial activity | Ref |
|-----------------------------|-----------------------|----------------------------------|-------------------------------------------------------------------------------------------|------------------------|-----|

2.2. Phytotherapeutics

Roots, leaves, seeds, bark or other part of medicinal plants possess therapeutic, tonic, purgative or other pharmacologic activity under *in vitro* as well as *in vivo* conditions. Several plants are used in various countries as the source of potent and powerful medicines20. Alkaloids, norsecurinines, phyllanthine, phyllochrysine, saponins, quercetin, quercetol, rutin, quercitrin, astragalin, galallocatechins, niruretin, nirurin, brevifolin, ellagic acid ellagittannins, repandusnic acids, geraniin, carboxylic acids, corilagin, cyneme, lupeols, phyllanthanol, lignans, hypophyllanthin, niranthin, nirtetralin, lintetralins, methyl salicylate, niruriside, triacantanal, tricontanol etc. type of bioactive compounds are present in various plants as the source of therapeutic components21.

The innovation of medicinal plants in different parts of the globe is vital to the agriculture and medicine sectors, in defining the new guidelines towards spread of unconventional medicinal crops that offer improved commercial welfares22. Some tribal communities are mostly dependent upon the natural resources for their traditional food habits as well as for treating common illnesses such as diarrhea, dysentery, vomiting, headache, cold, and fever23.

Indian flora deals countless possibilities for the detection of new compounds with important medicinal uses in opposing infection. The antimicrobial compounds found in plants may inhibit bacterial toxicities by alternative mechanisms than the conventional one24. Phytotherapy, prepared from different plant materials, such as Ayurvedic traditional medicine, are relatively safe, cost effective and have less or no side effects25.

Most of the current *in vitro* study on different medicinal plants with their experimental particulars, in terms of the antibacterial activity, are summarized in Table 2, where some research on bioactive fruit plants and spice herbs are also included.
### Table 2: Antibacterial activity of different plant extracts

| Plants          | Plant parts | Extracting solvent                      | Activity against Bacteria                                                                 | Antibacterial activity | Ref |
|-----------------|-------------|-----------------------------------------|------------------------------------------------------------------------------------------|------------------------|-----|
| **Medicinal plants** |             |                                         |                                           |                        |     |
| *Aegle marmelous* (Bael) | Leaves | Hexane, acetone, ethanol, and aqueous | Gram negative: *E. coli*, *Ps. aeruginosa*, *Salmonella enterica*, *Shigella sonnei*   | ND                     | 23  |

### 2.3. Probiotics

Probiotics, in the form of lactic acid bacteria (LAB), generally the lactobacilli, might be crucial in controlling the emerging antibiotic resistant pathogenic bacteria. Probiotics have the inhibition property against bacterial pathogens, including the antibiotic resistant individuals: spoilage, food-borne and pathogenic bacteria, by producing H₂O₂, lactic acid and bacteriocins. Sheep and goat milks and their derivatives (cheese and yoghurt) are commercially available as functional foods, which are with nutritional as well as medicinal importance, and can be selected as valid candidates having microbiological and technological qualities. Current studies revealed that some lactic acid bacteria isolated from non-milk fermented foods act as potential probiotics with huge nutritional as well as medicinal values that might be due to the production of bacteriocins. In the intestine, probiotic microorganisms compete with pathogenic bacteria in terms of nutrients and cell-surface for colonization, and can create inhibition against biofilm formation and quorum sensing properties of many pathogens. The milk and non-milk food-based probiotics, being isolated and characterised by the scientists from around the world, are summarized, in terms of the effectiveness against bacteria, in Table 3.
Table 3: Antibacterial activity of probiotics

2.4. Antimicrobial peptides

Several authors reported that antimicrobial peptides (AMPs) can be administered as typical candidates effective against different MDR bacterial strains. Biofilms formation by the bacterial cells causes more resistant to antibiotic managements than the planktonic forms of the same bacterial strains. Food protein hydrolysates and fermented food products serves as promising source of bioactive AMPs. The caseins and whey proteins are major milk precursors proteins found in cow milk. Caseins derived bioactive peptides consists of about thirty different constituents comprising with genomic variations, mainly of αs- (αs1-, αs2-), β, and κ-casein. Most of the potential AMPs are cationic as well as amphipathic in nature consisting of a minimum five to maximum hundred amino acids. Current studies have shown that some probiotics can synthesise AMPs that contribute significantly to host survivability, exclusively against pathogenic bacteria. Although scientists are facing some difficulties in obtaining significant and economically sustainable quantities of AMPs, and thus they are trying to manufacture heterologous endogenous AMPs using cloning technique.

Recently, a number of anionic antimicrobial peptides have been identified in vertebrates, invertebrates and plants. The vast source of antimicrobial peptides is marine organisms because of their close contact with microbes. Some antimicrobial peptides derived from plants are mostly composed of cystine-rich peptides. Insects is one of the major sources of antimicrobial peptides that show inhibition against bacteria, fungi, viruses as well as some parasites. These can be classified into four families: the α-helical peptides (cecropin and moricin), glycine-rich peptides (gloverin and attacin), proline-rich peptides (drosocin, apidaecin and lebocin) and cysteine-rich peptides (insect drosomycin and defense).

Recent studies showed antimicrobial peptides can potentially serve as novel antimicrobial agents. Different AMPs can be utilized by innate immune cells and proteins to counterbalance microbial infections, and contribute more to other cellular and/or biomolecular pathways. Table 4 summarizes the antibacterial activities of AMPs with molecular weight ranging from 1.55 to 41.44 kDa.

### Table 4: Antibacterial activity of different bioactive peptides

| Source                         | Amino acid number in peptides | Molecular weight (kDa) | Activity against bacteria | Antibacterial activity | Ref |
|--------------------------------|-----------------------------|------------------------|---------------------------|------------------------|-----|
| Sea Cucumber, *Holothuria tubulosa* | 14 – 36                     | 1.55 – 4.09            | Gram positive: *Listeria monocytogenes* | ND                     | 1200 – 5000 | ND | 59 |
| Bacteriocin from *Lactococcus lactis* MMFII (from a Tunisian dairy product) | ~40                        | 25 – 41.44            | Gram positive: *Enterococcus faecalis* [H22 E. faecalis V583 Listeria ivanovi BUG 496] | ND | 0.05 – 0.1 | 20 – 60 | 65 |
| Bacteriocin produced by *Lactobacillus plantarum* KLDS1.0391 (from fermented cream from China) | ND                        | 21.80 – 29.70         | Gram negative: *Salmonella typhimurium* | ND | ND              | 80 | 66 |
| Marine Ascidian *Didemnum* sp. | ND                        | < 40                  | Gram negative: *Ps. aeruginosa ATCC 27853 Salmonella typhimurium ATCC 202165* | 7 – 11 | 1.83 – 2.30 | ND | 67 |

| Source | Amino acid number in peptide | Molecular weight (kDa) | Activity against bacteria | Antibacterial activity | Ref |
|--------|------------------------------|------------------------|--------------------------|------------------------|-----|
| Laba garlic | 5 – 6 | 4 – 6 | Gram negative: E. coli, ATCC 25922, S. enteritidis BNCC103134, Gram positive: B. subtilis ATCC 6633, and S. aureus ATCC 25923 | ZDI (mm): 9 – 27, MIC (µg/ml): 100 – 450, AU/ml: ND | 69 |
| Skin Secretion of the Fujian Large Headed Frog, Limnonectes fujianensis | 33 | ND | Gram negative: E. coli NCTC 10418 | ZDI (mm): ND, MIC (µg/ml): 16 – 32, AU/ml: ND | 70 |
| Moss Physcomitrella patens | 14 – 18 | ND | Gram negative: E. coli K-12 substr. MG1655, Gram positive: B. subtilis 16HHT | ZDI (mm): ND, MIC (µg/ml): 16 – 128, AU/ml: ND | 71 |
| Trianthema portulacastrum Leaves | ND | 5.57 – 23.44 | Gram negative: E. coli | ZDI (mm): 6 – 14, MIC (µg/ml): ND, AU/ml: ND | 72 |
| Rumen microbiome | <25 | ND | Gram negative: A. baumannii | ZDI (mm): ND, MIC (µg/ml): 64 – 128, AU/ml: ND | 73 |
| Rana arvalis | 13 – 32 | ND | Gram negative: E. coli ATCC 25922, Acinetobacter baumannii ATCC 19606, Gram positive: S. aureus ATCC 29213 and En. faecalis ATCC 29212 | ZDI (mm): ND, MIC (µg/ml): 16 – >64 µM, AU/ml: ND | 74 |

AU/ml: arbitrary unit per millilitre; MIC: Minimum inhibitory concentration, ND: not done, ZDI: zone diameter of inhibition

3. Concluding remarks

Due to the problem of antibiotic inactivity, exploration of alternative new antibacterial agents is needed to combat several life-threatening infections caused by MDR bacteria. Honey, plant extracts, probiotics and AMPs can inhibit the growth of infectious bacterial pathogens, as non-antibiotic antibacterials. Although, more specific experiments are required to know the effective dose dependent pharmacokinetic nature of the explored agents.
