ABSTRACT
We consider the Navier–Stokes equations in a half-plane with a drift term parallel to the boundary and a small source term of compact support. We provide detailed information on the behavior of the velocity and the vorticity at infinity in terms of an asymptotic expansion at large distances from the boundary. The expansion is universal in the sense that it only depends on the source term through some constants. The expansion also applies to the problem of an exterior flow past a small body moving at constant velocity parallel to the boundary, and can be used as an artificial boundary condition on the edges of truncated domains for numerical simulations.

1. Introduction

In this paper, we study the steady Navier–Stokes equations in the half-plane \( \Omega_+ = \{(x, y) \in \mathbb{R}^2 \mid y > 1\} \) with a drift term parallel to the boundary, a force of compact support, and zero Dirichlet boundary conditions at the boundary of the half-plane and at infinity,

\[
\partial_t u + u \cdot \nabla u + \nabla p - \Delta u = F, \tag{1}
\]

\[
\nabla \cdot u = 0, \tag{2}
\]

where \( F \) is smooth and of compact support in \( \Omega_+ \), i.e., \( F \in C_0^\infty(\Omega_+) \), subject to the boundary conditions

\[
\begin{align*}
    u(x, 1) &= 0, & x \in \mathbb{R}, \tag{3} \\
    \lim_{x \to \infty} u(x) &= 0. \tag{4}
\end{align*}
\]

Our main result is an asymptotic expansion for the solution to this problem.

For small forces, existence of a solution for this system together with basic bounds on the decay at infinity was proved in [1], and uniqueness of solutions was proved in [2] in a very general context. In [3] additional information on the decay at infinity was obtained. In a similar three dimensional case (see [4]), the asymptote of the velocity field has been analyzed to leading order. For a general introduction to the method used in this series of papers, see [5].

In [2] it was also shown that the asymptotic behavior of the unique solution to (1)–(4) is identical to the one for the problem of an exterior flow without force past a small body \( B \) moving parallel to the wall at constant velocity described in a frame comoving with the body. See Fig. 1 for a schematic of the two related problems. As a consequence, the asymptotic expansion which we provide here also describes the asymptotic behavior of the solution for the problem with a body. This asymptotic expression turns out to be particularly useful in order to provide artificial boundary conditions for numerical simulations of the flow with a body; see [6]. For completeness, we note that artificial boundary conditions obtained this way have also been applied with success in the numerical resolution of two and three-dimensional flows in the full space (see [7–10]).

Theorem 1. Let $u = (u, v)$ and $p$ be the solution to Eqs. (1)-(4) for $F$ small and let $\omega$ be the vorticity. Then, there exist constants $c_1, c_2$ such that for $\varepsilon > 0$,
\[
\lim_{y \to \infty} \sup_{x \in \mathbb{R}} |y^{5/2 - \varepsilon}(u(x, y) - u_{as}(x, y))| = 0, \tag{5}
\]
\[
\lim_{y \to \infty} \sup_{x \in \mathbb{R}} |y^{5/2 - \varepsilon}(v(x, y) - v_{as}(x, y))| = 0, \tag{6}
\]
\[
\lim_{y \to \infty} \sup_{x \in \mathbb{R}} |y^{9/2 - \varepsilon}(\omega(x, y) - \omega_{as}(x, y))| = 0, \tag{7}
\]
with
\[
u_{as}(x, y) = \frac{c_1}{y^{3/2}} \psi_1(x/y) + \frac{c_1}{y^2} \psi_2(x/y) + \frac{c_2}{y^2} \psi_2,2(x/y) - \frac{c_1}{y^2} \eta_W(x/y^2) - \frac{c_1}{y^2} \eta_B(x/y^2), \tag{8}
\]
\[
u_{as}(x, y) = \frac{c_1}{y^{3/2}} \psi_1(x/y) + \frac{c_1}{y^2} \psi_2(x/y) + \frac{c_2}{y^2} \psi_2,2(x/y) + \frac{c_1}{y^3} \omega_W(x/y^2) + \frac{c_1}{y^3} \omega_B(x/y^2), \tag{9}
\]
\[
\omega_{as}(x, y) = \frac{c_1}{y^{3/2}} \omega_W(x/y^2) + \frac{c_1}{y^3} \omega_B(x/y^2), \tag{10}
\]
and functions $\psi_1, \psi_2, \psi_2, \psi_1, \psi_2, \eta_W, \eta_B, \omega_W$ and $\omega_B$ as given in Appendix A.1.

Remark 2. This theorem is an immediate consequence of Theorem 10 in Section 3.

- The functions $\psi_1, \psi_2, \psi_2, \psi_1, \psi_2, \eta_W, \eta_B, \omega_W$ and $\omega_B$ are universal, i.e., independent of $F$.
- The power $5/2$ in the limits (5) and (6) is sharp, whereas the power $9/2$ in (7) can probably be improved by $1/2$ at the price of additional computations.
- Some terms in (8) and (9) are unimportant in view of the limits (5) and (6), but they are included such as to form a divergence-free velocity field in pairs of successive terms of $u_{as}$ and $v_{as}$, and such as to have two orders in both of the two scalings $x/y$ and $x/y^2$.
- The explicit forms of $u_{as}$ and $v_{as}$ imply that
  \[
  \lim_{y \to \infty} y^{3/2} u(xy, y) = c_1 \psi_1(x), \tag{11}
  \]
  \[
  \lim_{y \to \infty} y^{3/2} v(xy, y) = c_1 \psi_1(x), \tag{12}
  \]
which shows that the bounds given in [1] are sharp. Remark that this decay is faster than in the full plane (see [7]). Moreover, the components of the velocity field associated to the functions $\psi_i$ and $\psi_i$ are harmonic. The asymptotic expansion is thus given by the superposition of a potential flow and a flow carrying the vorticity, which is concentrated, to leading order, in a parabolic region called the “wake”, in the sense that
\[
\lim_{y \to \infty} y^3 \omega_{as}(xy, y) = c_1 \omega_W(x). \tag{13}
\]
In contrast to the case of an exterior problem in $\mathbb{R}^2$ (see for example [8] or [11, pp. 826–829]), the vorticity is however not exponentially small outside the wake, since we have in particular, for all $x \in \mathbb{R}$,
\[
\lim_{y \to \infty} y^3 \omega_{as}(x, y) = c_1 \omega_B(0) \neq 0, \tag{14}
\]
which shows that a background of vorticity is created by the interaction of the fluid with the boundary.

Whereas the efforts in previous papers were concentrated on proving various basic properties of the solution, the present paper focuses on obtaining the above-mentioned explicit asymptotic expansion. In the remainder of this paper, when we invoke “the solution”, it will be understood that it has the properties proved in the previous papers referenced above (i.e., existence, uniqueness and decay properties).

Our main result is summarized in the following theorem.

Remark 2. this theorem is an immediate consequence of Theorem 10 in Section 3.

- The functions $\psi_1, \psi_2, \psi_2, \psi_1, \psi_2, \eta_W, \eta_B, \omega_W$ and $\omega_B$ are universal, i.e., independent of $F$.
- The power $5/2$ in the limits (5) and (6) is sharp, whereas the power $9/2$ in (7) can probably be improved by $1/2$ at the price of additional computations.
- Some terms in (8) and (9) are unimportant in view of the limits (5) and (6), but they are included such as to form a divergence-free velocity field in pairs of successive terms of $u_{as}$ and $v_{as}$, and such as to have two orders in both of the two scalings $x/y$ and $x/y^2$.
- The explicit forms of $u_{as}$ and $v_{as}$ imply that
  \[
  \lim_{y \to \infty} y^{3/2} u(xy, y) = c_1 \psi_1(x), \tag{11}
  \]
  \[
  \lim_{y \to \infty} y^{3/2} v(xy, y) = c_1 \psi_1(x), \tag{12}
  \]
which shows that the bounds given in [1] are sharp. Remark that this decay is faster than in the full plane (see [7]). Moreover, the components of the velocity field associated to the functions $\psi_i$ and $\psi_i$ are harmonic. The asymptotic expansion is thus given by the superposition of a potential flow and a flow carrying the vorticity, which is concentrated, to leading order, in a parabolic region called the “wake”, in the sense that
\[
\lim_{y \to \infty} y^3 \omega_{as}(xy, y) = c_1 \omega_W(x). \tag{13}
\]
In contrast to the case of an exterior problem in $\mathbb{R}^2$ (see for example [8] or [11, pp. 826–829]), the vorticity is however not exponentially small outside the wake, since we have in particular, for all $x \in \mathbb{R}$,
\[
\lim_{y \to \infty} y^3 \omega_{as}(x, y) = c_1 \omega_B(0) \neq 0, \tag{14}
\]
which shows that a background of vorticity is created by the interaction of the fluid with the boundary.
• This asymptotic expansion exhibits two scalings, whereas the three dimensional analogue (see [4]) exhibits only one (the analogue to the x/y scaling). In addition, the current expansion is sharp for all components of the velocity field and takes into account an additional order, necessary to reveal the background of vorticity outside the wake.

• The constants $c_1$ and $c_2$ are expressed in terms of the solution, in (29) and (75) respectively.

• These results confirm the conjecture concerning the vorticity of the problem described in [12]. In the present paper the asymptotic behavior is known modulo the constants $c_1$ and $c_2$, whereas the conjecture had three undetermined constants in its representation.

The rest of this paper is organized as follows. In Section 2 we recall the functional framework defined in [1] in which the solutions were constructed. In Section 3 we also recall the map defined in [1] which yielded the solution in terms of its fixed point. We then present a new result which allows to improve the bounds on the solution. In Section 4 we first extract the leading order terms of the velocity and vorticity. Using these terms, we then improve the bounds from Section 3 and extract the next order of the asymptotic expansion. The Appendix contains an explicit representation of the asymptotic terms, as well as various technical propositions and details of computations used in the main sections.

2. Functional framework

We first recall the functional framework of [1].

**Definition 3.** Let $f$ be a complex valued function on $\Omega_+$. Then, we define the inverse Fourier transform $f = \mathcal{F}^{-1}[\hat{f}]$ by the equation,

$$f(x, y) = \mathcal{F}^{-1}[\hat{f}](x, y) = \frac{1}{2\pi} \int_{\mathbb{R}} e^{-ik \cdot x} \hat{f}(k, y) dk,$$

and $\hat{h} = \hat{f} \ast \hat{g}$ by

$$\hat{h}(k, y) = (\hat{f} \ast \hat{g})(k, y) = \frac{1}{2\pi} \int_{\mathbb{R}} \hat{f}(k - k', y) \hat{g}(k', y) dk',$$

whenever the integrals make sense. We note that for functions $f, g$ which are smooth and of compact support in $\Omega_+$ we have $f = \mathcal{F}^{-1}[\hat{f}]$, and that $fg = \mathcal{F}^{-1}[\hat{f} \ast \hat{g}]$, where

$$\hat{f}(k, y) = \mathcal{F}[f](k, y) = \int_{\mathbb{R}} e^{ikx} f(x, y) dx,$$

and similarly $\hat{g} = \mathcal{F}[g]$.

Whereas in direct space we use the variables $(x, y)$, in Fourier space we use the variables $(k, t)$, where $k$ is the Fourier-conjugated variable of $x$ and $y \equiv t$ (this choice of notation was made to remain consistent with [1]).

**Definition 4.** Let $\alpha, r \geq 0, k \in \mathbb{R}$ and $t \geq 1$, and let

$$\mu_{\alpha, r}(k, t) = \frac{1}{1 + (|k| t^r)^\alpha}.$$

We set $\mu_{\alpha, r}(k, t) = \mu_{\alpha, 1}(k, t), \mu_{\alpha, r}(k, t) = \mu_{\alpha, 2}(k, t)$.

**Definition 5.** We define, for fixed $\alpha \geq 0$, and $p, q \in \mathbb{R}$, $B_{p, q}$ to be the Banach space of functions $\hat{f} \in C(\mathbb{R} \setminus \{0\} \times [1, \infty), \mathbb{C})$, for which the norm

$$\|\hat{f}; B_{p, q}\| = \sup_{t \geq 1} \sup_{k \in \mathbb{R} \setminus \{0\}} \frac{|\hat{f}(k, t)|}{1/p \mu_{\alpha, r}(k, t)}$$

is finite. The notations $B_{p, q, \infty}$ and $B_{p, q, \infty}$ are used for spaces of functions for which the norms

$$\|\hat{f}; B_{p, q, \infty}\| = \sup_{t \geq 1} \sup_{k \in \mathbb{R} \setminus \{0\}} \frac{|\hat{f}(k, t)|}{1/p \mu_{\alpha, r}(k, t)}$$

and

$$\|\hat{f}; B_{p, q, \infty}\| = \sup_{t \geq 1} \sup_{k \in \mathbb{R} \setminus \{0\}} \frac{|\hat{f}(k, t)|}{1/p \mu_{\alpha, r}(k, t)}$$

are finite, respectively.
Remark 6. The following elementary properties of the spaces $\mathcal{B}_{a,p,q}$ will be routinely used without mention:

- for $\alpha \geq 0$ and $p, q \in \mathbb{R}$, we have
  $$\mathcal{B}_{a,p,q} \subset \mathcal{B}_{a,\min\{p,q\},\infty}.$$

- if $\alpha, \alpha' \geq 0$ and $p, p', q, q' \in \mathbb{R}$, then
  $$\mathcal{B}_{a,p,q} \cap \mathcal{B}_{a',p',q'} \subset \mathcal{B}_{\min\{\alpha', \alpha\}, \min\{p', p\}, \min\{q', q\}}.$$

In the remainder of this paper, “const.” stands for some constant independent of $k$ and $t$ that may change from one occurrence to the next without notice. If $\hat{f} \in \mathcal{B}_{a,p,q}$ with $\alpha > 1$, then we have the bound

$$\int_\mathbb{R} |\hat{f}(k, t)| dk \leq \|\hat{f}; \mathcal{B}_{a,p,q}\| \int_\mathbb{R} \left(\frac{1}{t^\alpha} \tilde{\mu}_\alpha(k, t) + \frac{1}{t^{\alpha+2}} \tilde{\mu}_\alpha(k, t)\right) dk \leq \text{const.} \|\hat{f}; \mathcal{B}_{a,p,q}\| \left(\frac{1}{t^{\alpha+1}} + \frac{1}{t^{\alpha+2}}\right) \leq \text{const.} \|\hat{f}; \mathcal{B}_{a,p,q}\|,$$

which by Definition 3 immediately gives

$$\sup_{x \in \mathbb{R}} |\hat{f}(x, y)| \leq \text{const.} \|\hat{f}; \mathcal{B}_{a,p,q}\|,$$

The $\mathcal{B}_{a,p,q}$ spaces thus encode the decay behavior in direct space in the direction perpendicular to the wall, uniformly along lines parallel to the wall. For convenience later on we also define

$$\kappa = \sqrt{k^2 - ik},$$

$$\tau = t - 1,$$

$$\sigma = s - 1,$$

and

$$\Lambda_- = -\text{Re}(\kappa) = -\frac{1}{2} \sqrt{2k^2 + k^4 + 2k^2}.$$

To further unburden the notations, we set

$$\mu_0 = \frac{1}{s^{\frac{1}{2}}} \tilde{\mu}_\alpha(k, s) + \frac{1}{s^3} \tilde{\mu}_\alpha(k, s),$$

$$\mu_1 = \frac{1}{s^{\frac{1}{2}}} \tilde{\mu}_\alpha(k, s) + \frac{1}{s^3} \tilde{\mu}_\alpha(k, s).$$

3. Functional equations

We recall the definition of the map $\mathcal{N}$ which allowed to prove the existence of a solution by the contraction mapping principle, in [1]. Then we present improved bounds on the maps composing $\mathcal{N}$. These bounds are then used in the next section together with the fact that the solution exists, to extract successive terms of the asymptotic expansion.

We begin by introducing the basic elements. The velocity field $(\hat{u}, \hat{v})$ is decomposed into

$$\hat{u} = -\hat{\eta} + \hat{\psi},$$

$$\hat{v} = \hat{\omega} + \hat{\psi},$$

with $\hat{\omega}$ the vorticity. The nonlinear terms are represented by

$$\hat{Q}_0(k, t) = \hat{u} \ast \hat{\omega} + \hat{F}_2,$$

$$\hat{Q}_1(k, t) = \hat{v} \ast \hat{\omega} - \hat{F}_1,$$

where $\hat{F} = (\hat{F}_1, \hat{F}_2) = \mathcal{S}[F]$. The functions composing the velocity field are themselves further decomposed as follows

$$\hat{\psi} = \sum_{m=0}^\infty \sum_{n=1}^\infty \hat{\psi}_{n,m},$$

$$\hat{\omega} = \sum_{m=0}^\infty \sum_{n=1}^\infty \hat{\omega}_{n,m},$$

This decomposition highlights various features of the solution, already evident in the integral representation obtained in [1] and reproduced for the sake of completeness in Appendix A.2. We recall that the terms (16) represent, to leading orders, the Eulerian behavior of the flow, whereas the terms (17) represent, again to leading orders, the wake (or rotational) behavior.
of the flow. The index $m$ indicates whether the component depends on the nonlinear term (14) or (15), whereas the index $n$ is related to a finer distinction specific to the integral representation itself. The terms contributing to leading-order are those with $m = n = 1$. We shall recall the explicit forms of some of these components later on as they are needed.

For $\alpha > 1$, we have the map

$$\mathcal{N} : \mathcal{V}_\alpha \to \mathcal{V}_\alpha = \mathcal{B}_{a, \alpha^{7/2 - 1}} \times \mathcal{B}_{a, \alpha^{1/2}} \times \mathcal{B}_{a, \alpha^{1/2}}$$

with

$$\mathcal{C} : \mathcal{V}_\alpha \times \mathcal{V}_\alpha \to \mathcal{W}_\alpha = \mathcal{B}_{a, \alpha^{7/2 - 1}} \times \mathcal{B}_{a, \alpha^{1/2}} \times \mathcal{B}_{a, \alpha^{1/2}}$$

$$(\hat{\omega}, \hat{u}, \hat{v}) \mapsto \mathcal{L}[\{(\hat{\omega}, \hat{u}, \hat{v}), (\hat{\omega}, \hat{u}, \hat{v}) + (\hat{F}_2, -\hat{F}_1)\}],$$

where

$$\hat{\omega}_2,0 = (\hat{\omega}_2,0(0, t)) = \frac{1}{2} \left( \int_0^t f_2,0(k, s) \, ds \right),$$

and

$$\hat{\omega}_3,0 = (\hat{\omega}_3,0(0, t)) = \frac{1}{2} \left( \int_0^t f_3,0(k, s) \, ds \right),$$

with

$$\hat{\omega}_4,0 = (\hat{\omega}_4,0(0, t)) = \frac{1}{2} \left( \int_0^t f_4,0(k, s) \, ds \right).$$

Remark 9. Given the decay behavior in direct space provided by (11), it is clear that the components with indices (1, 1) play a dominant role in Theorem 1. In fact, functions in $\mathcal{B}_{a,p,q}$ with $p \geq 3/2$ and $q \geq 1/2$ are negligible in the sense of the limits given in (5) and (6), although Theorem 1 includes some additional terms to satisfy the divergence-free criterion and to have two orders of the asymptotics in both scalings. In the same way, functions with indices $p \geq 4$ and $q \geq 3$ are negligible in the sense of the limit given in (7). One would then expect $\hat{\omega}_{2,1}$ and $\hat{\omega}_{3,1}$ to be relevant, but new and better bounds are proved in Section 4.7, so that they will turn out to be negligible, too.

Proof. Using that $Q_0, Q_1 \in \mathcal{Z}_\alpha$, and following otherwise the proof of Lemma 5 in [1], this is straightforward for all functions except $\hat{\omega}_{2,0}, \hat{\eta}_{2,0}$ and $\hat{\omega}_{3,0}$. Note that $\delta \in (0, 1)$ using (138).

For $\hat{\omega}_{2,0}$, we recall that

$$\hat{\omega}_{2,0}(k, t) = \frac{1}{2} e^{-\kappa(t-1)} \int_t^\infty f_{2,0}(k, s-1) Q_0(k, s) \, ds,$$
with
\[ f_{2,0}(k, \sigma) = \left( \frac{ik}{\kappa} - \frac{(|k| + \kappa)^2}{\kappa} \right) e^{-\kappa|\sigma|} + 2(|k| + \kappa) e^{-|\kappa|}. \]

We have the bound
\[ |f_{2,0}(k, \sigma)| \leq \text{const.} \ (|k|^{1/2} + |k|) e^{-|\kappa|}, \]
so that we therefore have for \( \hat{\omega}_{2,0} \)
\[ |\hat{\omega}_{2,0}(k, t)| \leq \text{const.} \ e^{A_\sigma(t)} \int_k^\infty |f_{2,0}(k, \sigma)| \mu_0(k, s) ds \]
\[ \leq \text{const.} \ e^{A_\sigma(t)} e^{k(t)} \int_k^\infty (|k|^{1/2} + |k|) e^{-|\kappa|} \frac{1}{s^{5/2}} \hat{\mu}_a(k, s) ds \]
\[ + \text{const.} \ e^{A_\sigma(t)} e^{k(t)} \int_k^\infty (|k|^{1/2} + |k|) e^{-|\kappa|} \frac{1}{s^{7/2}} \hat{\mu}_a(k, s) ds. \] (20)

The term in (20) is estimated with Proposition 24
\[ e^{A_\sigma(t)} e^{k(t)} \int_k^\infty (|k|^{1/2} + |k|) e^{-|\kappa|} \frac{1}{s^{5/2}} \hat{\mu}_a(k, s) ds \leq \text{const.} \ e^{A_\sigma(t)} \frac{1}{t^3} \hat{\mu}_a(k, t). \] (22)

The term (21) requires us to distinguish the cases \( 1 \leq t \leq 2 \) and \( t > 2 \). In the first case, we have, using Proposition 24,
\[ e^{A_\sigma(t)} e^{k(t)} \int_k^\infty (|k|^{1/2} + |k|) e^{-|\kappa|} \frac{1}{s^{5/2}} \hat{\mu}_a(k, s) ds \leq \text{const.} \ \frac{1}{t^{5/2}} \hat{\mu}_a(k, t) \leq \text{const.} \ \frac{1}{t^{3}} \hat{\mu}_a(k, t), \] (23)

and in the second case we have, using (134) to trade the factor \(|k|^{1/2}\) for a factor \( s^{-1}\) and then applying Proposition 24,
\[ e^{A_\sigma(t)} e^{k(t)} \int_k^\infty (|k|^{1/2} + |k|) e^{-|\kappa|} \frac{1}{s^{5/2}} \hat{\mu}_a(k, s) ds \]
\[ \leq \text{const.} \ e^{A_\sigma(t)} e^{k(t)} \int_k^\infty e^{-\kappa|\sigma|} \left( \frac{1}{s^{3}} \mu_{a-1/2}(k, s) + |k| \frac{1}{s^{3}} \hat{\mu}_a(k, s) \right) ds \]
\[ \leq \text{const.} \ e^{A_\sigma(t)} \frac{1}{t^3} \hat{\mu}_{a-1/2}(k, t). \] (24)

Collecting (22)–(24) and applying (133), we finally have
\[ |\hat{\omega}_{2,0}(k, t)| \leq \text{const.} \ \frac{1}{t^3} \hat{\mu}_a(k, t). \]

Indeed, for \( t > 2 \) the index \( \alpha \) is arbitrarily large due to the exponential factor.

For the function \( \tilde{\hat{\omega}}_{2,0} \), we have, from [1] and using Proposition 7, that
\[ |\tilde{\hat{\omega}}_{2,0}(k, t)| \leq \text{const.} \ e^{A_{\sigma}(t)} e^{-|\kappa|} \left( \frac{1}{t^{5/2}} \mu_a(k, t) + \frac{1}{t^3} \hat{\mu}_a(k, t) \right). \]

Using inequality (133) shows that \( \tilde{\hat{\omega}}_{2,0} \in B_{\alpha, \infty, 2}. \)

For \( \hat{\omega}_{3,0} \) we recall from [1] that
\[ |\hat{\omega}_{3,0}(k, t)| \leq \text{const.} \ \left| \frac{k}{ik} (e^{k(t)} - e^{-k(t)}) \right| \int_0^\infty |f_{2,0}(k, \sigma)| \mu_0(k, s) ds, \]
with
\[ |f_{2,0}(k, \sigma)| \leq \text{const.} \ e^{A_{\sigma}} \min\{1, |A_-|^2\} \leq \text{const.} \ e^{A_{\sigma}} |A_-|. \]

Since \( |A_-| \sim |k|^{1/2} \) for \( |k| \leq 1 \) and \( |A_-| \sim |k| \) for \( |k| > 1 \), we use for the first case \( |f_{2,0}(k, \sigma)| \leq \text{const.} \ e^{A_{\sigma}} |A_-|^2 \) and for the second case \( |f_{2,0}(k, \sigma)| \leq \text{const.} \ e^{A_{\sigma}} |A_-| \) and we have, for all \(|k|\), using Proposition 21,
\[ |\hat{\omega}_{3,0}(k, t)| \leq \text{const.} \ e^{A_{\sigma}(t)} |A_-| \mu_0(k, s) ds \]
\[ \leq \text{const.} \ \left( \frac{1}{t^{7/2}} \hat{\mu}_a(k, t) + \frac{1}{t^3} \hat{\mu}_a(k, t) \right). \] □
4. Asymptotic terms

4.1. Strategy

In this section we extract the leading asymptotic terms of the functions $\hat{\psi}, \hat{\phi}, \hat{\eta}, \hat{\omega}$ and $\partial_t \hat{\omega}$. We then calculate an explicit representation of these asymptotic terms in direct space which allows us to prove even tighter bounds on the nonlinear terms $\hat{Q}_0, \hat{Q}_1$, as well as $\partial_t \hat{Q}_1$, than the ones given in Proposition 7 and [3]. The new bounds on $\hat{Q}_0$ and $\hat{Q}_1$ are then used to further improve the bounds on $\hat{\psi}, \hat{\phi}, \hat{\eta},$ and $\hat{\omega}$, which, together with the tighter bound on $\partial_t \hat{Q}_1$, allow us to extract second-order terms in two steps. First, we extract the second-order terms of $\hat{\psi}$ and $\hat{\phi}$, which allows us to improve the bounds on the non-linear terms once again using their direct-space representation. Then, we proceed to extract the second order terms of $\hat{\eta}$ and $\hat{\omega}$.

The extraction procedure is as follows: we first identify the leading components in view of Proposition 8 and Remark 9. We then calculate for each of these components the pointwise limit as $t \to \infty$ for one of two scalings: $k \mapsto k/t$ if the slowest direct space decay in the sense of (11) is due to the index $p$, $k \mapsto k/t^2$ if it is due to the index $q$. We finally prove that the difference between the leading component and this pointwise limit is in a $B_{a,p,q}$ or $B_{a,p,q}$ which is smaller due to an improvement in the index that determined the scaling choice, thus identifying the pointwise limit as the leading asymptotic term. For the second order asymptotic term, we proceed in the same way using any new bound obtained in between to identify the components from which we have to extract it. As we will see, this is actually the leading component minus the leading order asymptotic term, for which we then calculate a new pointwise limit to obtain the second order term.

In this section, some bounds lead to a decrease of $\alpha$ by $-3$. Since the solution exists for arbitrary $\alpha > 3$, this does not pose a problem. We now present our main technical result. To unburden the notation in the proofs and results we set

$$\alpha' = \alpha - 1, \quad \alpha'' = \alpha - 2.$$

**Theorem 10** (Asymptotes in $B_{a,p,q}$ Spaces). Let $\hat{u} \subset B_{\alpha,\frac12,0}$, $\hat{v} \subset B_{\alpha,\frac12,1}$, $\hat{\omega} \subset B_{\alpha,\frac12,1}$ as constructed in [1], with $\hat{u} = -\hat{\eta} + \hat{\psi}$, $\hat{v} = \hat{\omega} + \hat{\psi}$, $\hat{\omega} = \hat{\psi}$ by (30) and (73), for $\hat{\phi}$ by (31) and (74), for $\hat{\omega}$ by (42) and (90), and finally for $\hat{\eta}$ by (41) and (89).

In the remainder of this section we give a proof of this theorem.

4.2. Leading order in $\hat{\psi}$ and $\hat{\phi}$

In view of Proposition 8 and Remark 9, the leading order terms of $\hat{\psi}$ and $\hat{\phi}$ are to be extracted from $\hat{\psi}_{1,1}$ and $\hat{\phi}_{1,1}$, respectively. We use that $\hat{\psi}, \hat{\phi} \subset B_{\alpha,\frac12,\infty} \supset B_{\alpha,\frac12,2}$ since for these functions we are not interested in the wake behavior.

We have (see [1]),

$$\hat{\psi}_{1,1}(k, t) = \frac{1}{2} e^{-|k(t-1)|} \int_1^t h_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds,$$

$$\hat{\phi}_{1,1}(k, t) = \frac{1}{2} e^{-|k(t-1)|} \int_1^t k_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds,$$

with

$$h_{1,1}(k, \sigma) = -e^{-|\sigma|} + \frac{(|k| + \kappa)^2}{ik} e^{-|k|\sigma} - 2 \kappa (|k| + \kappa) e^{-\kappa \sigma},$$

$$k_{1,1}(k, \sigma) = -\frac{|k|}{ik} h_{1,1}(k, \sigma).$$
Formally, we get from (25) and (26)
\[
\lim_{t \to \infty} \sqrt{t} \hat{\psi}_{1,1}(k/t, t) = -c_1 \sqrt{-i k e^{-|k|}},
\]
\[
\lim_{t \to \infty} \sqrt{t} \hat{\psi}_{1,1}(k/t, t) = c_1 \frac{|k|}{i k} \sqrt{-i k e^{-|k|}},
\]
with
\[
c_1 = \int_1^{\infty} (s - 1) \hat{Q}_1(0, s) \, ds.
\]  
(29)

This motivates the definition of the functions
\[
\hat{\psi}_{as,1}(k, t) = \frac{1}{\sqrt{t}} \hat{\psi}_{1,1}(kt) = -c_1 \sqrt{-i k e^{-|k|}},
\]
\[
\hat{\psi}_{as,1}(k, t) = \frac{1}{\sqrt{t}} \hat{\psi}_{1,1}(kt) = c_1 \frac{|k|}{i k} \sqrt{-i k e^{-|k|}}.
\]  
(30)  
(31)

Note that \( \hat{\psi}_{as,1}, \hat{\psi}_{as,1} \in B_{u, \frac{2}{3}, \infty} \). We now show that
\[
\hat{\psi}_{1,1} - \hat{\psi}_{as,1} \in B_{u', \infty},
\]
\[
\hat{\psi}_{1,1} - \hat{\psi}_{as,1} \in B_{u', \infty}.  
\]  
(32)  
(33)

**Proof.** We have
\[
\hat{\psi}_{1,1} = -\frac{|k|}{i k} \hat{\psi}_{1,1},
\]
and thus all the bounds on \( \hat{\psi}_{1,1} \) are directly transposable to \( \hat{\psi}_{1,1} \), and we only present the proof for \( \hat{\psi}_{1,1} \). In order to prove (32) we analyze
\[
\hat{\psi}_{1,1}(k, t) - \hat{\psi}_{as,1}(k, t) = \frac{1}{2} e^{-|k|(t-1)} \int_1^t h_{1,1}(k, s - 1) \hat{Q}_1(k, s) \, ds + \frac{1}{2} e^{-|k|} \int_1^{\infty} 2 \sqrt{-i k} (s - 1) \hat{Q}_1(0, s) \, ds.
\]
We rewrite this expression as a sum of terms which can easily be bounded. Namely,
\[
\hat{\psi}_{1,1}(k, t) - \hat{\psi}_{as,1}(k, t) = \sum_{i=1}^{3} \hat{\psi}_{i,1}(k, t),
\]
with
\[
\hat{\psi}_{1,1} = \frac{1}{2} \left( e^{-|k|(t-1)} - e^{-|k|} \right) \int_1^t h_{1,1}(k, s - 1) \hat{Q}_1(k, s) \, ds,
\]
\[
\hat{\psi}_{2,1} = \frac{1}{2} e^{-|k|} \int_1^t \left( h_{1,1}(k, s - 1) \hat{Q}_1(k, s) + 2 \sqrt{-i k} (s - 1) \hat{Q}_1(0, s) \right) \, ds,
\]
\[
\hat{\psi}_{3,1} = \frac{1}{2} e^{-|k|} \int_t^{\infty} 2 \sqrt{-i k} (s - 1) \hat{Q}_1(0, s) \, ds.
\]

To bound \( \hat{\psi}_{1,1} \) we use that
\[
|h_{1,1}(k, \sigma)| \leq \text{const.} \, (1 + |k|) e^{|k|} \min\{1, (1 + |k|^{1/2})|k|^{1/2} \sigma\},
\]
inequality (134), Propositions 22 and 23, so that we get
\[
|\hat{\psi}_{1,1}^{r,1}| = \left| \frac{1}{2} \left( e^{-|k|(t-1)} - e^{-|k|} \right) \int_1^t h_{1,1}(k, s - 1) \hat{Q}_1(k, s) \, ds \right|
\]
\[
\leq \text{const.} \, e^{-|k|} |k| e^{|k|} \int_1^t (1 + |k|) e^{|k|} \min\{1, (1 + |k|^{1/2})|k|^{1/2} \sigma\} \mu_1(k, s) \, ds
\]
\[
\leq \text{const.} \left( \frac{1}{t^{3/2}} \bar{\mu}_{\alpha-1}(k, t) + \frac{1}{t^{4}} \bar{\mu}_{\alpha-1}(k, t) \right),
\]
which shows that \( \hat{\psi}_{1,1}^{r,1} \in B_{u', \frac{2}{3}, \infty} \).
To bound $\hat{\psi}_{r,1}$ we first note that by (128)

$$h_{1,1}(k, \sigma) \hat{Q}_1(k, s) + 2\sqrt{-i\kappa} \hat{Q}_1(0, s) = (h_{1,1}(k, \sigma) + 2\sqrt{-i\kappa}) \hat{Q}_1(k, s) - 2\sqrt{-i\kappa} \hat{Q}_1(\xi, s),$$

for some $\xi \in [0, k]$. We analyze the expression

$$h_{1,1}(k, \sigma) + 2\sqrt{-i\kappa} = -e^{-|k|\sigma} + \frac{(|k| + \kappa)^2}{ik} e^{-|k|\sigma} - 2\frac{\kappa (|k| + \kappa)}{ik} e^{-\kappa \sigma} + 2\sqrt{-i\kappa},$$

in further detail, with $h_{1,1}$ given by (27). A straightforward bound is

$$\left|h_{1,1}(k, \sigma) + 2\sqrt{-i\kappa}\right| \leq \text{const.} (1 + |k|(|\sigma + 1)|) e^{||k|\sigma|},$$

(34)

but since the leading terms cancel, we also have

$$h_{1,1}(k, \sigma) + 2\sqrt{-i\kappa} = -e^{-|k|\sigma} - (e^{-|k|\sigma} - 1 + |k|\sigma) + 2\left(e^{-\kappa \sigma} - 1 + \kappa \sigma\right) + 2|k|^2 + 2|k| \kappa\sigma,$$

which we can bound, using (130), by

$$\left|h_{1,1}(k, \sigma) + 2\sqrt{-i\kappa}\right| \leq \text{const.} |k|\sigma^2 e^{k|\sigma|} + \text{const.} |k|\sigma^2 + \text{const.} |k|^2 \sigma^2 + \text{const.} (|k|^{1/2} + |k|)(|k|\sigma + |k|\sigma) + \text{const.} |k|^{3/2}\sigma$$

\leq \text{const.} (\sigma + 1)(|k| + |k|^2)e^{k|\sigma|}.

(35)

We have used here, and shall routinely use again throughout this paper without further explicit mention, that for all $z \in \mathbb{C}$ with $\text{Re}(z) \leq 0$ and $N \in \mathbb{N}$,

$$\left|e^{z} - \sum_{n=0}^{N-1} \frac{z^n}{n!}\right| \leq \text{const.},$$

and for all $z \in \mathbb{C}$ with $\text{Re}(z) > 0$

$$\left|e^{z} - \sum_{n=0}^{N-1} \frac{z^n}{n!}\right| \leq \text{const.} e^{\text{Re}(z)}.$$

Therefore, using (34) and (35), we get

$$\left|h_{1,1}(k, \sigma) + 2\sqrt{-i\kappa}\right| \leq \text{const.} \min\{1 + |k|(|\sigma + 1)|, (|k| + |k|^2)(\sigma + 1)|\} e^{|k|\sigma}.$$

(36)

Collecting these bounds yields

$$|\hat{\psi}_{r,1}^{(1)}| \leq \frac{1}{2} e^{-|k|t} \int_{t}^{1} \left|h_{1,1}(k, s - 1) \hat{Q}_1(k, s) + 2\sqrt{-i\kappa}(s - 1) \hat{Q}_1(0, s)\right| ds$$

\leq \text{const.} e^{-|k|t} \int_{1}^{t} \left|h_{1,1}(k, \sigma) + 2\sqrt{-i\kappa}\right| \mu_4(k, s) ds + \text{const.} e^{-|k|t} |k|^{3/2} \int_{1}^{t} (s - 1) \left|\hat{Q}_1(\xi, s)\right| ds.$$

By (129) and (135) the second term is in $\mathcal{B}_{\alpha, \frac{1}{2} - \delta, \infty}$. Using (36) and Propositions 22 and 23 we also show that

$$\left|\hat{\psi}_{r,1}^{(1)}\right| \leq \text{const.} \left(\frac{1}{t} \hat{\mu}_4(k, t) + \frac{1}{t^{3/2}} \hat{\mu}_4(k, t) + \frac{1}{t^{3/2}} \hat{\mu}_4(k, t)\right).$$

such that, in all $\hat{\psi}_{r,1}^{(1)} \in \mathcal{B}_{\alpha, 1, \infty}$. Finally, using (135), we have

$$|\hat{\psi}_{r,1}^{(1)}| \leq |e^{-|k|t} \int_{t}^{\infty} \sqrt{-i\kappa}(s - 1) \hat{Q}_1(0, s) ds| \leq \text{const.} e^{-|k|t} |k|^{1/2} e^{\frac{1}{t^{3/2}}} \in \mathcal{B}_{\alpha, 2, \infty}.$$

Gathering the bounds on $\hat{\psi}_{r,1}^{(1)}$ yields (32), and by the opening remark of the proof also (33).
4.3. Leading order in $\hat{\eta}$ and $\hat{\omega}$

In view of Proposition 8 and Remark 9, the leading order terms of $\hat{\eta}$ and $\hat{\omega}$ are to be extracted from $\hat{\eta}_{1,1}$ and $\hat{\omega}_{1,1}$, respectively. We have (see [1]),
\begin{align}
\hat{\eta}_{1,1}(k, t) &= \frac{1}{2} e^{-\kappa(t-1)} \int_1^t g_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds,
\end{align}
(37)
\begin{align}
\hat{\omega}_{1,1}(k, t) &= \frac{1}{2} e^{-\kappa(t-1)} \int_1^t f_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds,
\end{align}
(38)
with
\begin{align}
g_{1,1}(k, \sigma) &= \frac{\kappa}{ik} \left( e^{\kappa \sigma} + \frac{(|k| + \kappa)^2}{ik} e^{-\kappa \sigma} - 2 \frac{|k|(|k| + \kappa)}{ik} e^{-|k| \sigma} \right),
\end{align}
(39)
\begin{align}
f_{1,1}(k, \sigma) &= \frac{ik}{\kappa} \hat{g}_{1,1}(k, \sigma).
\end{align}
(40)

Formally, we get from (37) and (38)
\begin{align}
\lim_{t \to \infty} \hat{\eta}_{1,1}(k/t^2, t) &= -c_1 e^{-\sqrt{-ik} t} =: \hat{\eta}_{1,1}^1(k),
\end{align}
\begin{align}
\lim_{t \to \infty} t \hat{\omega}_{1,1}(k/t^2, t) &= c_1 \sqrt{-ik} e^{-\sqrt{-ik} t} =: \hat{\omega}_{1,1}^1(k),
\end{align}
with $c_1$ as defined in (29). This motivates the definition of the functions
\begin{align}
\hat{\eta}_{as,1}(k, t) &= \hat{\eta}_{1,1}^1(kt^2) = -c_1 e^{-\sqrt{-ik} t},
\end{align}
(41)
\begin{align}
\hat{\omega}_{as,1}(k, t) &= \frac{1}{t} \hat{\omega}_{1,1}^1(kt^2) = c_1 \sqrt{-ik} e^{-\sqrt{-ik} t}.
\end{align}
(42)

Note that $\hat{\eta}_{as,1} \in B_{r, \infty, 0}$ and $\hat{\omega}_{as,1} \in B_{r, \infty, 1}$. We now show that
\begin{align}
\hat{\eta}_{1,1} - \hat{\eta}_{as,1} \in B_{r', \frac{3}{2}, 1},
\end{align}
(43)
\begin{align}
\hat{\omega}_{1,1} - \hat{\omega}_{as,1} \in B_{r', \frac{3}{2}, 2}.
\end{align}
(44)

Proof. We have
\begin{align}
\hat{\omega}_{1,1} = \frac{ik}{\kappa} \hat{\eta}_{1,1},
\end{align}
with, see Appendix A.3,
\begin{align}
\text{const.} \leq \left| \frac{ik}{\kappa} \right| \leq \text{const. } \min\{1, \left| \Lambda - \right|\},
\end{align}
which means that the bounds on $\hat{\omega}_{1,1}$ are the same as those for $\hat{\eta}_{1,1}$ for $|k| > 1$, but have an additional factor of $|\Lambda - |$ for $|k| \leq 1$. This results in an increase of 1 in both the indices $p$ and $q$ for the components $\omega$ when compared to the ones for $\hat{\eta}$. This means that $\hat{\omega}$ decays $1/t$ faster than $\hat{\eta}$, and since
\begin{align}
\lim_{t \to \infty} t \cdot \frac{ik}{t^2 k (k/t^2)} = -\sqrt{-ik},
\end{align}
the asymptote of $\hat{\omega}$ is naturally derived from the one of $\hat{\eta}$. We therefore only present the details of the proof for $\hat{\eta}$, since the proof for $\hat{\omega}$ can easily be recovered by inserting the appropriate factors in the proof for $\hat{\eta}$.

In order to prove (43) we set
\begin{align}
\hat{\eta}_{1,1}(k, t) - \hat{\eta}_{as,1}(k, t) = \sum_{i=1}^4 \hat{\eta}_{i}^{r, 1},
\end{align}
where
\begin{align}
\hat{\eta}_{1}^{r, 1} &= \frac{1}{2} \left( e^{-\kappa(t-1)} - e^{-\kappa t} \right) \int_1^t g_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds,
\end{align}
\begin{align}
\hat{\eta}_{2}^{r, 1} &= \frac{1}{2} e^{-\kappa t} \int_1^t \left( g_{1,1}(k, s - 1) \hat{Q}_1(k, s) + 2(s - 1) \hat{Q}_1(0, s) \right) ds,
\end{align}
\[ \hat{\eta}_3^{r,1} = -\left(e^{-\kappa t} - e^{-\sqrt{-\kappa}t}\right) \int_1^t (s - 1) \hat{Q}_1(0, s) ds, \]
\[ \hat{\eta}_4^{r,1} = e^{-\sqrt{-\kappa}t} \int_1^\infty (s - 1) \hat{Q}_1(0, s) ds. \]

We have
\[ |g_{1,1}(k, \sigma)| \leq \begin{cases} \text{const. } \sigma e^{k|\sigma|} & \text{for } |k| \leq 1, \\ \text{const. } |A_-| e^{k|\sigma|} & \text{for } |k| > 1, \end{cases} \]
and we treat the two cases separately, using both times Propositions 19 and 20. For $|k| \leq 1$ we have
\[ |\hat{\eta}_1^{r,1}| = \frac{1}{2} (e^{-\kappa t} - e^{-\sqrt{-\kappa}t}) \int_1^t g_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds \]
\[ \leq \text{const. } e^{k|\sigma|} |A_-| \int_1^t \sigma e^{k|\sigma|} \mu_1(k, s) ds \]
\[ \leq \text{const. } \left(1 + \frac{1}{t^2} \hat{\mu}_\sigma(k, t) + \frac{1}{t^2} \hat{\mu}_\sigma(k, t) \right), \]
and for $|k| > 1$ we have, using (134),
\[ |\hat{\eta}_1^{r,1}| = \frac{1}{2} (e^{-x(t-1)} - e^{-x}) \int_1^t g_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds \]
\[ \leq \text{const. } e^{k|\sigma|} |A_-| \int_1^t |A_-| e^{k|\sigma|} \mu_1(k, s) ds \]
\[ \leq \text{const. } \left(\frac{1}{t^4} \hat{\mu}_{\sigma-1} + \frac{1}{t^4} \hat{\mu}_{\sigma-1} \right), \]
so that $\hat{\eta}_1^{r,1} \in B_{\hat{\mu}, \frac{1}{t^2}, \frac{1}{t^4}}$.

To bound $\hat{\eta}_2^{r,1}$ we note that by (128)
\[ g_{1,1}(k, \sigma) \hat{Q}_1(k, s) + 2\sigma \hat{Q}_1(0, s) = (g_{1,1}(k, \sigma) + 2\sigma) \hat{Q}_1(k, s) - 2\sigma k \hat{Q}_1(0, s), \]
for some $\xi \in [0, k]$. We first analyze the expression
\[ g_{1,1}(k, \sigma) + 2\sigma = \frac{k}{i\kappa} \left( e^{\kappa \sigma} + \frac{|k| + \kappa} {i\kappa} e^{-\kappa \sigma} - 2\frac{|k|(|k| + \kappa)} {i\kappa} e^{-|k|\sigma} + 2\frac{ik}{\kappa} \right). \]
A straightforward bound is
\[ |g_{1,1}(k, \sigma) + 2\sigma| \leq \begin{cases} \text{const. } \sigma e^{k|\sigma|} & \text{for } |k| \leq 1, \\ \text{const. } (\sigma + 1 + |A_-|) e^{k|\sigma|} & \text{for } |k| > 1. \end{cases} \]
(45)
Since the leading terms cancel, we also have
\[ g_{1,1}(k, \sigma) + 2\sigma = \frac{k}{i\kappa} \left( e^{\kappa \sigma} - 1 - \kappa \sigma\right) - (e^{-\kappa \sigma} - 1 + \kappa \sigma) \]
\[ + \frac{\kappa}{i\kappa} \left( \frac{2|k|^2 + 2|k|\kappa}{i\kappa} \right) \left( e^{\kappa \sigma} - 1 - \kappa e^{-|k|\sigma} - 1 \right) + 2\kappa + 2\frac{ik}{\kappa} \sigma, \]
which we can bound by
\[ |g_{1,1}(k, \sigma) + 2\sigma| \leq \text{const. } \frac{k}{i\kappa} \left( |A_-|^2 |\sigma|^2 e^{k|\sigma|} + |A_-|^2 |\sigma|^2 + \frac{|k|^2 + 2|k|\kappa}{i\kappa} \right) \left( |A_-| |\sigma| + |k| |\sigma| + 2|A_-|^2 \sigma \right) \]
\[ \leq \begin{cases} \text{const. } |A_-| |\sigma| (|A_-| + 1) e^{k|\sigma|} & \text{for } |k| \leq 1, \\ \text{const. } |A_-|^2 |\sigma| (|A_-| + 1) e^{k|\sigma|} & \text{for } |k| > 1, \end{cases} \]
(46)
Using that
\[ |\kappa + \frac{ik}{\kappa}| \leq \frac{|k^2 - ik\kappa| + |ik\kappa|}{|\kappa|} \leq \text{const. } |k|^{3/2} \leq \text{const. } |A_-|^2. \]
Therefore, using (45) and (46), we get
\[
|g_{1,1}(k, \sigma) + 2\sigma| \leq \begin{cases} 
\text{const. } \sigma e^{A_- |\sigma|} \min \{1, |A_-| (\sigma + 1)\} & \text{for } |k| \leq 1 \\
\text{const. } e^{A_- |\sigma|} \min \{(\sigma + 1 + |A_-|), |A_-|^2 \sigma (\sigma + 1)\} & \text{for } |k| > 1.
\end{cases}
\]

Collecting these bounds yields
\[
|\hat{n}_{2,1}^r| = \left| \frac{1}{2} e^{-xt} \int_1^t \left( g_{1,1}(k, \sigma) \hat{Q}_1(k, s) + 2\sigma \hat{Q}_1(0, s) \right) ds \right| \leq \text{const. } e^{A_- t} \int_1^t \left| g_{1,1}(k, \sigma) + 2\sigma \right| \mu_1(k, s)ds + \text{const. } e^{A_- t} |k| \int_1^t \sigma \left| \hat{b}_1 \hat{Q}_1(\zeta, s) \right| ds.
\]

The second term of this inequality on $|\hat{n}_{2,1}^r|$ can be integrated and bounded due to (129), and is in $\mathcal{B}_{\sigma, \infty, \frac{3}{2}}$ by (136). For the first term, using Propositions 19 and 20 with the bound (47) we have, for $|k| \leq 1$,
\[
\left| \frac{1}{2} e^{-x(t-1)} \int_1^t \left( g_{1,1}(k, \sigma) + 2\sigma \right) \hat{Q}_1(k, s) ds \right| \leq \text{const. } \left( \frac{1}{t^2} \hat{\mu}_\sigma(k, t) + \frac{1}{t^{3/2}} \hat{\mu}_\sigma(k, t) + \frac{1}{t^2} \hat{\mu}_\sigma(k, t) \right),
\]
and for $|k| > 1$,
\[
\left| \frac{1}{2} e^{-x(t-1)} \int_1^t \left( g_{1,1}(k, \sigma) + 2\sigma \right) \hat{Q}_1(k, s) ds \right| \leq \text{const. } \left( \frac{1}{t^2} \hat{\mu}_\sigma(k, t) + \frac{1}{t^{3/2}} \hat{\mu}_\sigma(k, t) + \frac{1}{t^2} \hat{\mu}_\sigma(k, t) \right),
\]
which shows that $\tilde{n}_{2,1}^r \in \mathcal{B}_{\sigma, \frac{3}{2}}$.

We now bound $\tilde{n}_{3,1}^r$, which, using (136), yields
\[
|\tilde{n}_{3,1}^r| = \left| e^{-x} - e^{-\sqrt{\pi} \alpha} \right| \int_1^t (s - 1) \hat{Q}_1(0, s) ds \leq \text{const. } e^{-\sqrt{\pi} \alpha} |k|^{3/2} t \in \mathcal{B}_{\sigma, \infty, 2}.
\]

Finally, using (136), we have
\[
|\tilde{n}_{4,1}^r| = \left| e^{-\sqrt{\pi} \alpha} \int_1^\infty (s - 1) \hat{Q}_1(0, s) ds \right| \leq \text{const. } e^{-\sqrt{\pi} \alpha} \left( \frac{1}{t^{3/2}} \right) \in \mathcal{B}_{\sigma, \infty, \frac{3}{2}}.
\]

Gathering the bounds on the $\hat{n}_{i,1}^r$ yields (43), and by the opening remark of the proof also (44). □

4.4. Leading order in $\partial_k \hat{\omega}$

For technical reasons that will become clear in the procedure of extracting second order asymptotic terms, it is necessary to give tighter bounds on $\partial_k \hat{Q}_1 = \hat{\nu} * \partial_k \hat{\omega} + \partial_k \hat{F}_1$ and $\partial_k \hat{\omega}$ (we recall that $\hat{\omega}$ is continuous on $\mathbb{R}$ and $C^1$ on $\mathbb{R} \setminus \{0\}$, and that the derivative on $\mathbb{R}$ is to be understood in the sense of distributions). From [3] we have
\[
\begin{align*}
\kappa \partial_k \hat{\omega} \in \mathcal{B}_{\sigma, \mathbb{R}, \frac{3}{2}}, \\
\kappa \partial_k \hat{\omega} - \kappa \partial_k \hat{\omega}_{1,1} - \kappa \partial_k \hat{\omega}_{2,1} \in \mathcal{B}_{\sigma, \mathbb{R}, \frac{3}{2}},
\end{align*}
\]

with
\[
\begin{align*}
\partial_k \hat{\omega}_{1,1}(k, t) &= \frac{1}{2} \left( \partial_k e^{-x} \right) \int_1^t f_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds, \quad (49) \\
\partial_k \hat{\omega}_{2,1}(k, t) &= \frac{1}{2} e^{-x} \int_1^t \left( \partial_k f_{1,1}(k, s - 1) \right) \hat{Q}_1(k, s) ds, \quad (50)
\end{align*}
\]

with $f_{1,1}$ given by (40), with
\[
\partial_k \kappa = \frac{2k - i}{2\kappa},
\]
and
\[
\begin{align*}
\partial_k f_{1,1}(k, \sigma) &= \frac{i (|k| + \kappa)^2}{\kappa |k|} (e^{-|k|\sigma} - e^{-\kappa \sigma}) + \frac{k^2 + \kappa^2}{2\kappa} (e^\sigma + e^{-\kappa \sigma}) \sigma \\
&+ \frac{2i k^2 + |k| \kappa}{k^2} \left( \frac{k^2 + \kappa^2}{2\kappa} e^{-\kappa \sigma} - |k| e^{-|k|\sigma} \right). \quad (51)
\end{align*}
\]
We have, from (42),
\[ \partial_k \hat{\omega}_{as}(k) = \frac{c_1}{2} \left( 1 - \frac{1}{\sqrt{-ikt}} \right) e^{-\sqrt{-ikt}}, \]  
with \( c_1 \) as defined by (29). Note that \( \partial_k \hat{\omega}_{as} \in \mathcal{B}_{a', \infty, 0} \). We now show that
\[ \kappa \partial_k \hat{\omega}_{1,1} + \kappa \partial_k \hat{\omega}_{2,1} - \kappa \partial_k \hat{\omega}_{as} \in \mathcal{B}_{\alpha', \frac{3}{2}, 1}. \]  

**Remark 11.** Note that
\[ \mathcal{F}^{-1}[-i \partial_k \hat{\omega}_{as}(k, y)] = \kappa \omega_N(x, y) = \kappa \mathcal{F}^{-1}[\hat{\omega}_{as, 1}(k, y)]. \]

**Proof.** In order to prove (53) we note that
\[ \kappa \partial_k \hat{\omega}_{1,1}(k, t) + \kappa \partial_k \hat{\omega}_{2,1}(k, t) - \kappa \partial_k \hat{\omega}_{as}(k, t) = -\frac{2k - i}{4} \tau e^{-\kappa t} \int_1^t f_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds \]
\[ + \frac{1}{2} \kappa \tau e^{-\kappa t} \int_1^t f_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds \]
\[ - \frac{\kappa}{2} \left( 1 - \frac{1}{\sqrt{-ikt}} \right) e^{-\sqrt{-ikt}} \int_1^\infty (s - 1) \hat{Q}_1(0, s) ds. \]
We rewrite this expression as a sum of terms which can easily be bounded. Namely,
\[ \kappa \partial_k \hat{\omega}_{1,1}(k, t) + \kappa \partial_k \hat{\omega}_{2,1}(k, t) - \kappa \partial_k \hat{\omega}_{as}(k, t) = \sum_{i=1}^5 \kappa \partial_k \hat{\omega}_i, \]
with
\[ \kappa \partial_k \hat{\omega}_1(k, t) = \frac{2k - i}{4} \tau \left( e^{-\kappa(t-1)} - e^{-\kappa t} \right) \int_1^t f_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds, \]
\[ \kappa \partial_k \hat{\omega}_2(k, t) = \frac{2k - i}{4} \tau e^{-\kappa t} \int_1^t f_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds - \frac{\kappa}{2} \tau e^{-\sqrt{-ikt}} \int_1^t (s - 1) \hat{Q}_1(0, s) ds, \]
\[ \kappa \partial_k \hat{\omega}_3(k, t) = \frac{1}{2} \left( e^{-\kappa(t-1)} - e^{-\kappa t} \right) \int_1^t \kappa \partial_k f_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds, \]
\[ \kappa \partial_k \hat{\omega}_4(k, t) = \frac{1}{2} \tau e^{-\kappa t} \int_1^t \kappa \partial_k f_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds + \frac{\kappa}{2} \tau e^{-\sqrt{-ikt}} \int_1^t (s - 1) \hat{Q}_1(0, s) ds, \]
\[ \kappa \partial_k \hat{\omega}_5(k, t) = -\frac{\kappa}{2} \left( 1 - \frac{1}{\sqrt{-ikt}} \right) e^{-\sqrt{-ikt}} \int_1^\infty (s - 1) \hat{Q}_1(0, s) ds. \]
In the rest of this proof, we apply without mention (134) to eliminate spurious powers of \(|\Lambda_-|\) whenever the conditions of Propositions 19 and 20 require it.

First we have
\[ |\kappa \partial_k \hat{\omega}_1| = \left| \frac{2k - i}{4} \tau \left( e^{-\kappa(t-1)} - e^{-\kappa t} \right) \int_1^t f_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds \right| \]
\[ \leq \text{const. } (1 + |k|) \tau e^{\Lambda_- \cdot (t-1)} |\Lambda_-| \int_1^t (1 + |\Lambda_-|) e^{\Lambda_- \cdot \sigma} \min(1, |\Lambda_-|) \mu_1(k, s) ds \]
\[ \leq \text{const. } t \left( \frac{1}{t} \mu_{a-2} + \frac{1}{t^{1/2}} \hat{\mu}_{a-2} + \frac{1}{t^4} \hat{\mu}_{a-2} \right), \]
showing that \( \kappa \partial_k \hat{\omega}_1 \in \mathcal{B}_{\alpha', \frac{3}{2}, 1}. \)

For \( \kappa \partial_k \hat{\omega}_2 \), we have
\[ -\frac{2k - i}{4} \tau e^{-\kappa t} \int_1^t f_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds - \frac{\kappa}{2} \tau e^{-\sqrt{-ikt}} \int_1^t (s - 1) \hat{Q}_1(0, s) ds \]
\[ = -\frac{2k - i}{4} \tau e^{-\kappa t} \int_1^t f_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds - \frac{\kappa}{2} \tau e^{-\sqrt{-ikt}} \int_1^t (s - 1) \hat{Q}_1(0, s) ds \]
\[ + e^{-\kappa t} \int_1^t \frac{2k - i}{4} f_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds, \]  
(54)
where the last term can be bounded by applying Propositions 19 and 20, so that
\[ |e^{\lambda t} \int_1^l \frac{2k-i}{4} f_{1,1}(k, s-1) \hat{Q}_1(k, s) ds| \leq \text{const. } e^{\lambda t} \int_1^l (1 + |\Lambda_-|^2) e^{\lambda |\sigma|} \min\{1, |\Lambda_-|\} \mu_1(k, s) ds \]
\[ \leq \text{const. } \left( \frac{1}{t} \tilde{\mu}_{\alpha-1}(k, t) + \frac{1}{t^{5/2}} \tilde{\mu}_{\alpha-1}(k, t) \right), \]
whereas for (54), we get
\[ -\frac{2k-i}{4} e^{-\lambda t} \int_1^l f_{1,1}(k, s-1) \hat{Q}_1(k, s) ds - i\frac{e^{-\lambda t}}{2} \int_1^l (s-1) \hat{Q}_1(0, s) ds \]
\[ = -\frac{t}{2} \left( e^{-\lambda t} \int_1^l \frac{2k-i}{2} f_{1,1}(k, s-1) \hat{Q}_1(k, s) ds + e^{-\lambda t} \int_1^l i k (s-1) \hat{Q}_1(0, s) ds \right) \]
\[ = t \left( e^{-\lambda t} - e^{-\lambda t} \int_1^l i k (s-1) \hat{Q}_1(0, s) ds \right) \]
\[ - \frac{t}{2} e^{-\lambda t} \int_1^l \left( \frac{2k-i}{2} f_{1,1}(k, s-1) \hat{Q}_1(k, s) + ik(s-1) \hat{Q}_1(0, s) \right) ds. \]  
(55)

For (55) we get, using (131) and (136),
\[ \left| \frac{t}{2} \left( e^{-\lambda t} - e^{-\lambda t} \int_1^l i k (s-1) \hat{Q}_1(0, s) ds \right) \right| \leq \text{const. } t \left| e^{-\lambda t} \right| |k|^3/2 t(|k|^{1/2} + |k|) \in B_{\alpha, 2}. \]

To bound (56) we note that, using (128),
\[ -\frac{2k-i}{2} f_{1,1}(k, s-1) \hat{Q}_1(k, s) + ik(s-1) \hat{Q}_1(0, s) = \left( \frac{2k-i}{2} f_{1,1}(k, s-1) + ik(s-1) \right) \hat{Q}_1(k, s) \]
\[ + ik(s-1) \partial_k \hat{Q}_1(\zeta, s), \]
for some \( \zeta \in [0, k] \), which allows us to rewrite (56) as
\[ e^{-\lambda t} \int_1^l \left( \frac{2k-i}{2} f_{1,1}(k, s-1) \hat{Q}_1(k, s) + ik(s-1) \hat{Q}_1(0, s) \right) ds \]
\[ = e^{-\lambda t} \int_1^l \left( \frac{2k-i}{2} f_{1,1}(k, s-1) + ik(s-1) \right) \hat{Q}_1(k, s) ds + e^{-\lambda t} \int_1^l ik(s-1) \partial_k \hat{Q}_1(\zeta, s) ds. \]  
(57)

For the last term we have, using (136),
\[ \left| e^{-\lambda t} \int_1^l ik(s-1) \partial_k \hat{Q}_1(\zeta, s) ds \right| \leq \text{const. } e^{\lambda t} |k|(|k|^{1/2} + |k|) \sqrt{t} \in B_{\alpha, \frac{5}{2}}. \]

To bound (57) we use that
\[ \frac{2k-i}{2} f_{1,1}(k, \sigma) + ik \sigma = \frac{2k-i}{2} \left( e^{\lambda \sigma} + \frac{|k| + k}{2} e^{-\lambda \sigma} - 2 \frac{|k||k| + k}{i k} e^{-|k|\sigma} \right) + ik \sigma \]
\[ = k \left( e^{\lambda \sigma} + \frac{|k| + k}{2} e^{-\lambda \sigma} - 2 \frac{|k||k| + k}{i k} e^{-|k|\sigma} \right) - \frac{i}{2} \left( e^{\lambda \sigma} - 1 - \kappa \sigma \right) \]
\[ - \left( e^{-\lambda \sigma} - 1 + \kappa \sigma \right) + \frac{|k||k| + k}{k} \left( e^{-\lambda \sigma} - 1 - e^{-|k|\sigma} - 1 \right), \]
which, using the usual bound on \( f_{1,1} \) and using the fact that leading order terms cancel where we put them in evidence, we get
\[ \left| \frac{2k-i}{2} f_{1,1}(k, \sigma) + ik \sigma \right| \leq \text{const. } (|k| (1 + |\Lambda_-|) \min\{1, |\Lambda_-|\sigma\} + \min\{1, |\Lambda_-|\} |\Lambda_-| \sigma + |\Lambda_-|^2 \sigma) e^{\lambda |\sigma|}, \]
which, using Propositions 19 and 20, yields
\[ e^{-\lambda t} \int_1^l \left( \frac{2k-i}{2} f_{1,1}(k, s-1) + ik(s-1) \right) \hat{Q}_1(k, s) ds \in B_{\frac{\alpha}{2}, \frac{5}{2}}. \]

All in all, we thus have \( \kappa \partial_k \hat{\omega}_2^\alpha \in B_{\frac{\alpha}{2}, \frac{5}{2}} \).
To bound \( \kappa \partial_\kappa \hat{\omega}_f \) we use the bound (see [3])
\[
|\kappa \partial_f f_{1,1}(k, \sigma) | \leq \text{const.} \ (1 + |A_-|^2) |\sigma| e^{A_+ |\sigma|}.
\]
and using Propositions 19 and 20 we get
\[
\left| \frac{1}{2} \left( e^{-x(t-1)} - e^{-xt} \right) \int_1^t \kappa \partial_k f_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds \right| \leq \text{const.} \ e^{A_- (t - 1)} |A_-| \int_1^t (1 + |A_-|^2) e^{i A_+ |\sigma|} \mu_1(k, s) ds
\]
\[
\leq \text{const.} \left( \frac{1}{t^1} \hat{\mu}_{u-1} + \frac{1}{t^{5/2}} \hat{\mu}_{u-2} - \frac{1}{t^3} \hat{\mu}_{u-3} \right).
\]
Thus, \( \kappa \partial_\kappa \hat{\omega}_f \in \mathcal{B}_{\infty, \infty}^\infty \).

To bound \( \kappa \partial_\kappa \hat{\omega}_f \) we use that
\[
\kappa \partial_k \hat{\omega}_f = \frac{1}{2} e^{-xt} \int_1^t \kappa \partial_k f_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds - \frac{1}{2} e^{-\sqrt{-\kappa} t} \int_1^t \frac{\kappa \sqrt{-ik}}{k} (s - 1) \hat{Q}_1(0, s) ds
\]
\[
= \frac{1}{2} (e^{-xt} - e^{-\sqrt{-\kappa} t}) \int_1^t \frac{\kappa \sqrt{-ik}}{k} (s - 1) \hat{Q}_1(0, s) ds
\]
\[
+ \frac{1}{2} e^{-xt} \int_1^t \left( \kappa \partial_k f_{1,1}(k, s - 1) \hat{Q}_1(k, s) - \frac{\kappa \sqrt{-ik}}{k} (s - 1) \hat{Q}_1(0, s) \right) ds.
\]

We first bound (58) using (131) and (136). We have
\[
\left| \frac{1}{2} \left( e^{-xt} - e^{-\sqrt{-\kappa} t} \right) \int_1^t \frac{\kappa \sqrt{-ik}}{k} (s - 1) \hat{Q}_1(0, s) ds \right| \leq \text{const.} \ e^{-\sqrt{-\kappa} t} \left( \frac{|k|^{1/2} + |k| |k|^{1/2}}{|k|} \right) \in \mathcal{B}_{\alpha, \infty}^\infty.
\]

To bound (59) we note that, using (128),
\[
\kappa \partial_k f_{1,1}(k, s - 1) \hat{Q}_1(k, s) - \frac{\kappa \sqrt{-ik}}{k} (s - 1) \hat{Q}_1(0, s) = \left( \kappa \partial_k f_{1,1}(k, s - 1) - \frac{\kappa \sqrt{-ik}}{k} (s - 1) \right) \hat{Q}_1(k, s)
\]
\[
+ \frac{\kappa \sqrt{-ik}}{k} (s - 1) \partial_k \hat{Q}_1(\zeta, s),
\]
for some \( \zeta \in [0, k] \). We next analyze
\[
\kappa \partial_k f_{1,1}(k, \sigma) - \frac{\kappa \sqrt{-ik}}{k} \sigma = \frac{1}{|k|} \left( |k| + \kappa \right)^2 \left( (e^{-|k|\sigma} - 1) - (e^{-x\sigma} - 1) \right) + \frac{k^2 + \kappa^2}{2k} \left( (e^{x\sigma} - 1) + (e^{-x\sigma} - 1) \right) \sigma
\]
\[
+ \frac{2}{k^2} \left( k^2 + \kappa^2 - e^{-x\sigma} - |k| \kappa e^{-|k|\sigma} \right) \sigma + \frac{k^2 + \kappa^2}{k} \sigma - \frac{\kappa \sqrt{-ik}}{k} \sigma.
\]

For the last line we have, using (130),
\[
\left| \frac{k^2 + \kappa^2}{k} - \frac{\kappa \sqrt{-ik}}{k} \right| \leq |k| + \text{const.} \frac{|Z_-|}{|k|} \min\{|A_-|^2, |A_-| \}
\]
\[
\leq \text{const.} \ (|k| + |k|^3) \leq \text{const.} \ |A_-|^2 (1 + |A_-|),
\]
and therefore
\[
\left| \kappa \partial_k f_{1,1}(k, \sigma) - \frac{\kappa \sqrt{-ik}}{k} \sigma \right| \leq \text{const.} \ (1 + |A_-|^2) |A_-| \sigma (\sigma + 1) e^{A_+ |\sigma|}.
\]

We can now bound (59). Namely, we have,
\[
\left| \frac{1}{2} e^{-xt} \int_1^t \left( \kappa \partial_k f_{1,1}(k, s - 1) \hat{Q}_1(k, s) - \frac{\kappa \sqrt{-ik}}{k} (s - 1) \hat{Q}_1(0, s) \right) ds \right|
\]
\[
= \left| \frac{1}{2} e^{-xt} \int_1^t \left( \kappa \partial_k f_{1,1}(k, s - 1) - \frac{\kappa \sqrt{-ik}}{k} (s - 1) \right) \hat{Q}_1(k, s) ds \right| + \left| \frac{1}{2} e^{-xt} \int_1^t \frac{\kappa \sqrt{-ik}}{k} (s - 1) \partial_k \hat{Q}_1(\zeta, s) ds \right|
\]
\[
\leq \text{const.} e^{A_- t} \int_1^t (1 + |A_-|^2) |A_-| \sigma e^{A_+ |\sigma|} \mu_1(k, s) ds + \text{const.} e^{A_- t} (|k|^{1/2} + |k|) |k|^{1/2} \sqrt{t},
\]
where by Propositions 19 and 20, and inequality (134), the first term is in \( B_{a-2, \frac{3}{4}, 1} \) and where due to (136) the second term is in \( B_{a, \infty, \frac{5}{2}} \). Thus we get \( \kappa \partial_t \omega_t^\ell \in B_{a, \infty, \frac{7}{2}} \).

Finally, to bound \( \kappa \partial_t \omega_t^\ell \), we use (136), so that
\[
\left| \int_0^\infty \left( 1 - \frac{1}{\sqrt{-\kappa t}} \right) e^{-\sqrt{-\kappa t} s} \left( s - 1 \right) \dot{Q}_1(0, s) ds \right| \leq \text{const.} \left( |k|^{1/2} t + 1 \right) \left( |k|^{1/2} \right) \left| e^{-\sqrt{-\kappa t}} \right| \frac{1}{t^{3/2}} \in B_{a, \infty, \frac{5}{2}}.
\]

Gathering all the bounds on the \( \kappa \partial_t \omega_t^\ell \) leads to (53). \( \square \)

4.5. Improvement of the bounds on the non-linear terms

Improvement of the bounds on \( \dot{Q}_0 \) and \( \dot{Q}_1 \)

From Section 3 we know that
\[ \dot{Q}_1 = (\dot{\omega} + \dot{\psi}) \ast \dot{\omega} + \dot{F}_2 \in B_{a, \frac{7}{4}, 4}. \]

The force term \( \dot{F}_2 \) is a function of rapid decrease in \( k \) and of compact support in \( t \) and will thus not intervene in our bounds. Using (42), (44), (30) and (32), Propositions 8 and 16 we have
\[
\dot{\omega} \ast \dot{\omega} \in B_{a, \frac{7}{4}, 4}, \tag{60}
\]
\[ \dot{\psi} \ast (\dot{\omega} - \dot{\omega}_{as, 1}) \in B_{a', 4, \infty}, \tag{61} \]
\[ (\dot{\psi} - \dot{\psi}_{as, 1}) \ast \dot{\omega}_{as, 1} \in B_{a', 4, \infty}. \tag{62} \]

For the term \( \dot{\psi}_{as, 1} \ast \dot{\omega}_{as, 1} \) we can take advantage of the particular form of the explicit functions in direct space in order to improve the index \( p \) by \( 1/2 \) in comparison to what would be possible with the bounds on the convolution. In direct space we have,
\[
Q_i^\ell = \mathcal{F}^{-1}[\dot{Q}_i^\ell] = \mathcal{F}^{-1}[\dot{\psi}_{as, 1} \ast \dot{\omega}_{as, 1}] = \frac{1}{y^{3/2}} \int \psi_1(x/y) \cdot \frac{1}{y^{3/2}} \omega_\ell(x/y^2),
\]
where \( \psi_1 \) and \( \omega_\ell \) are explicitly represented by (98) and (105) in Appendix A.1. We use various properties of these functions as well as their derivatives of order \( n \), represented by the superscript \( (n) \), which are easily understood from their explicit representation and shall thus not be proved. We show that using the definition of the function spaces \( B_{a, \infty, q} \) we can improve the bound on \( \dot{Q}_1 \). We require that all the terms of the form
\[
\left| (|k|^2)^a \dot{Q}_1^\ell(k, y) \right| = (|k|^2)^a \int e^{ikx} \frac{1}{y^{3/2}} \psi_1(x/y) \omega_\ell(x/y^2) dx,
\]
for \( a \in \mathbb{N}, 0 \leq a \leq |\alpha| + 1 \), be bounded. Since, for \( n \geq 0 \), all the \( \psi_1^{(n)} \) and \( \omega_\ell^{(n)} \) are in \( C^{\infty}(\mathbb{R}) \) and vanish for \( |z| \rightarrow \infty \), we may integrate by parts and we have
\[
\left| (|k|^2)^a \dot{Q}_1^\ell(k, y) \right| = y^{2a} \int e^{ikx} \frac{1}{y^{3/2}} \partial^a_x \left( \psi_1(x/y) \omega_\ell(x/y^2) \right) dx.
\]

We then use make use of the Newton binomial to expand the partial derivative of a product of functions in terms of a product of ordinary derivatives,
\[
\left| (|k|^2)^a \dot{Q}_1^\ell(k, y) \right| \leq \text{const.} \cdot \int e^{ikx} \frac{1}{y^{3/2}} \sum_{n=0}^a \binom{a}{n} \frac{1}{y^n} \left| \psi_1^{(n)}(x/y) \right| \frac{1}{y^{2(a-n)}} \left| \omega_\ell^{(a-n)}(x/y^2) \right| dx.
\]

Using the essential fact that
\[
\sup_{z \in \mathbb{R}} \left| z^{n+3/2} \psi_1^{(n)}(z) \right| = \text{const.} < \infty, \quad n \geq 0,
\]
and that all the \( \omega_\ell^{(n)} \) are zero for \( z < 0 \), we have
\[
\left| (|k|^2)^a \dot{Q}_1^\ell(k, y) \right| \leq \text{const.} \cdot \sum_{n=0}^a \frac{1}{y^{3/2-n}} \int_0^\infty \frac{y^{n+3/2}}{x^{a+3/2}} \left| \omega_\ell^{(a-n)}(x/y^2) \right| dx.
\]
Finally, using the change of variables $z = x/y^3$ and the crucial fact that all the $\omega_W^{(n)}$ have exponential decay when $z \to 0$, we have
\[
\left| (|k|y^3)^a \hat{Q}_1(k, y) \right| \leq \text{const.} \sum_{n=0}^{\alpha} \frac{y^{n+3/2}}{y^{3(n+1/2)}} \int_0^\infty \frac{\omega_W^{(a-n)}(z)}{y^{2n+3}z^{n+3/2}} \, y^2 \, dz 
\leq \text{const.} \sum_{n=0}^{\alpha} \frac{1}{y^3} \int_0^\infty \frac{\omega_W^{(a-n)}(z)}{z^{n+1/2}} \, dz \leq \text{const.} \frac{1}{y^4}.
\]

From this we have $q = 4$ and thus $\hat{\psi}_{s,1} \ast \hat{\omega}_{s,1} \in B_{\alpha, \infty,4}$. We conclude, with (60)–(62), that
\[
\hat{Q}_1 \in B_{\alpha, -1,4,4}.
\]

Similarly, we have
\[
\hat{Q}_0 \in B_{\alpha, -1,4,3},
\]

where the index $q = 3$ is due to the product $\hat{\omega} \ast \hat{\eta}$. In light of (64) we define
\[
\mu_1^t := \frac{1}{s^3} \tilde{\mu}_{\omega'}(k, s) + \frac{1}{s^3} \tilde{\mu}_{\omega'}(k, s),
\]

to replace (13) from now on.

### 4.5.1. New bounds

It is now possible to reevaluate the bounds on all functions presented in Proposition 8.

**Proposition 12.** Let $\alpha' > 1$ and $\delta > 0$. We have
\[
\begin{align*}
\hat{\psi}_{1,0} & \in B_{\alpha', \frac{1}{2},-5,2}, & \hat{\psi}_{1,1} & \in B_{\alpha', \frac{1}{2}, 3}, & \hat{\psi}_{1,0} & \in B_{\alpha', \frac{1}{2},-5,2}, & \hat{\psi}_{1,1} & \in B_{\alpha', \frac{1}{2}, 3} \\
\hat{\psi}_{2,0} & \in B_{\alpha', 3,2}, & \hat{\psi}_{2,1} & \in B_{\alpha', 3,3}, & \hat{\psi}_{2,0} & \in B_{\alpha', 3,2}, & \hat{\psi}_{2,1} & \in B_{\alpha', 3,3} \\
\hat{\psi}_{3,0} & \in B_{\alpha', 3,2}, & \hat{\psi}_{3,1} & \in B_{\alpha', 3,3}, & \hat{\psi}_{3,0} & \in B_{\alpha', 3,2}, & \hat{\psi}_{3,1} & \in B_{\alpha', 3,3} \\
\hat{\omega}_{1,0} & \in B_{\alpha', 3,3-\delta}, & \hat{\omega}_{1,1} & \in B_{\alpha', 3,3}, & \hat{\omega}_{1,0} & \in B_{\alpha', 3,3-\delta}, & \hat{\omega}_{1,1} & \in B_{\alpha', 3,3} \\
\hat{\omega}_{2,0} & \in B_{\alpha', \infty, 3}, & \hat{\omega}_{2,1} & \in B_{\alpha', \infty, 3}, & \hat{\omega}_{2,0} & \in B_{\alpha', \infty, 2}, & \hat{\omega}_{2,1} & \in B_{\alpha', \infty, 3} \\
\hat{\omega}_{3,0} & \in B_{\alpha', 3,3}, & \hat{\omega}_{3,1} & \in B_{\alpha', 3,3}, & \hat{\omega}_{3,0} & \in B_{\alpha', 3,3}, & \hat{\omega}_{3,1} & \in B_{\alpha', 3,3}.
\end{align*}
\]

**Proof.** This is straightforward by the new bounds (65) and (64). For $\hat{\omega}_{s,1}$ and $\hat{\eta}_{s,1}$ we make use of an existing factor $e^{\Lambda_{t-1}}$ (see [1]) and apply (133), just as was done for $\hat{\omega}_{t,0}$ and $\hat{\eta}_{t,0}$ in the proof of Proposition 8. \(\square\)

**Remark 13.** We also have
\[
\hat{\omega} \ast \hat{\omega}_{s,1} \in B_{\alpha', 3,2},
\]
\[
\hat{\eta} \ast \hat{\eta}_{s,1} \in B_{\alpha', 2,1}.
\]

**Improvement of the bound on $\partial_k \hat{Q}_1$**

From [3] we have
\[
\partial_k \hat{Q}_1 = \hat{\psi} \ast \partial_k \hat{\omega} + \partial_k \hat{F}_2 \in B_{\alpha', \frac{1}{2}, 2}.
\]

The term $\partial_k \hat{F}_2$ is a function of rapid decrease in $k$ and of compact support in $t$ and will thus not intervene in our bounds. We use Propositions 12 and 18, (32), (48) and (53) to show that
\[
\hat{\omega} \ast \partial_k \hat{\omega} \in B_{\alpha', 4,2},
\]
\[
\hat{\psi} \ast (\partial_k \hat{\omega} - \partial_k \hat{\omega}_{s,1}) \in B_{\alpha', \frac{1}{2}, \infty},
\]
\[
(\hat{\psi} - \hat{\psi}_{s,1}) \ast \partial_k \hat{\omega}_{s,1} \in B_{\alpha', 2, \infty}.
\]

Since
\[
\mathcal{F}^{-1}[\partial_k \hat{\omega}_{s,1}](x, y) = \frac{X}{y^3} \omega_W(x/y^2),
\]
where we again use Property (63) of $\psi_{as,1}$ and the fact that $\omega^{(n)}_{as,1}(z < 0) = 0$, for all $n$, to show that the convolution product $\hat{\psi}_{as,1} \ast \partial_k \hat{\omega}_{as}$ can be bounded in direct space in order to improve the index $p$ by $1/2$ in comparison to what would be possible with the bounds on convolution. The calculation is slightly longer than in the previous section, but the steps are exactly the same, so that we omit the details of the proof for the sake of concision. We finally have

$$\hat{\psi}_{as,1} \ast \partial_k \hat{\omega}_{as} \in B_{a',\infty,2},$$

and we thus get

$$\partial_k \hat{Q}_1 \in B_{a'',2,2}. \quad (72)$$

### 4.6. Second order in $\hat{\psi}$ and $\hat{\phi}$

Applying the new bound (64) for $\hat{Q}_1$, in a straightforward manner, and in view of Proposition 12 and Remark 9, we find that the second order terms of $\hat{\psi}$ and $\hat{\phi}$ are to be extracted from $\hat{\psi}_{1,1} - \hat{\psi}_{as,1}$ and $\hat{\phi}_{1,1} - \hat{\phi}_{as,1}$, respectively. Inspecting the limits of these quantities motivates us, in a similar way as in the case of the leading order of $\hat{\psi}$ and $\hat{\phi}$, to define the functions

$$\hat{\psi}_{as,2}(k, t) = - \left( c_1 |k| + \frac{1}{2} c_2 ik \right) e^{-|k|t},$$

$$\hat{\phi}_{as,2}(k, t) = - \left( c_1 ik - \frac{1}{2} c_2 |k| \right) e^{-|k|t}, \quad (73)$$

with $c_1$ as defined by (29) and

$$c_2 = \int_1^\infty (s - 1)^2 \hat{Q}_1(0, s) \, ds. \quad (75)$$

Note that $\hat{\psi}_{as,2}, \hat{\phi}_{as,2} \in B_{a',1,\infty}$. We now show that

$$\hat{\psi}_{1,1} - \hat{\psi}_{as,1} - \hat{\psi}_{as,2} \in B_{a''', \frac{1}{2} - \delta, \infty}, \quad (76)$$

$$\hat{\phi}_{1,1} - \hat{\phi}_{as,1} - \hat{\phi}_{as,2} \in B_{a''', \frac{1}{2} - \delta, \infty}. \quad (77)$$

**Proof.** As already for the leading order term, we have

$$\hat{\psi}_{1,1} - \hat{\psi}_{as,1} = \frac{|k|}{ik} (\hat{\psi}_{1,1} - \hat{\psi}_{as,1}),$$

so that all bounds for $\hat{\psi} - \hat{\psi}_{as,1}$ are the same as the ones for $\hat{\phi} - \hat{\phi}_{as,1}$ and we only need to present the proof for $\hat{\psi}$. We set

$$\hat{\psi}_{1,1}(k, t) - \hat{\psi}_{as,1}(\hat{\psi}, t) - \hat{\psi}_{as,2}(k, t) = \sum_{i = 1}^{4} \hat{\psi}_{1,i}^2,$$

where

$$\hat{\psi}_{1,1} = \frac{1}{2} \left( e^{-|k|t(1 - 2\kappa)} - e^{-|k|t} \right) \int_1^t \left( h_{1,1}(k, \sigma) + 2\kappa \sigma \right) \hat{Q}_1(k, s) \, ds,$$

$$\hat{\psi}_{1,2} = \frac{1}{2} \left( e^{-|k|t} \right) \int_1^t \left( h_{1,1}(k, \sigma) + 2\kappa \sigma \right) \hat{Q}_1(k, s) \, ds,$$

$$\hat{\psi}_{1,3} = -\frac{1}{2} \left( e^{-|k|t} \right) \int_1^t \sqrt{-ik} \sigma \hat{Q}_1(0, s) \, ds - e^{-|k|t(1 - 2\kappa)} \int_1^t \kappa \sigma \hat{Q}_1(k, s) \, ds,$$

$$\hat{\psi}_{1,4} = \frac{1}{2} \left( e^{-|k|t} \right) \int_1^\infty \left( 2\sqrt{-ik} + 2|k| + ik \sigma \right) \sigma \hat{Q}_1(0, s) \, ds.$$

We first derive some bounds on $h_{1,1}$, given by (27). One has the straightforward bound

$$\left| h_{1,1}(k, \sigma) + 2\kappa \sigma \right| \leq \mathrm{const.} \left( 1 + |k| + (|k|^{1/2} + |k|) \sigma \right) e^{ik\sigma}. \quad (78)$$
and since the leading order terms cancel, we also have

\[ |h_{1,1}(k, \sigma) + 2k\sigma| \leq \left| (1 - e^{ik|\sigma|} + \frac{(|k| + \kappa)^2}{|k|} e^{-|k|\sigma} - 1) - 2 \frac{k(|k| + \kappa)}{|k|} (e^{-k\sigma} - 1) + 2k\sigma \right| \]

\[ \leq \left| (1 - e^{ik|\sigma|} + \frac{(|k| + \kappa)^2}{|k|} e^{-|k|\sigma} - 1) - 2 \frac{k(|k| + |k|^2)}{|k|} (e^{-k\sigma} - 1) + 2(e^{-k\sigma} - 1) + 2k\sigma \right| \]

\[ \leq \text{const.} \cdot (|k|\sigma + (1 + |k|)|\sigma| + (|k|^2 + |k|^2)\sigma^2 + ((|k|^2 + |k|)\sigma)e^{ik\sigma} + |k|^2 + |k|^2)\sigma^2 + ((|k|^3 + |k|^3)e^{ik\sigma}, \quad (79) \]

with \( c = [0, 1] \) depending on whether we use the \( 2k\sigma \) term to cancel an additional term in the last exponential or not. We have another straightforward bound, namely

\[ |h_{1,1}(k, \sigma) + 2k\sigma + 2|k|\sigma + i\kappa\sigma^2| \leq \text{const.} \cdot (1 + |k| + |k|^2\sigma + |k|\sigma(\sigma + 1))e^{ik|\sigma|}, \quad (80) \]

and, using that leading order terms cancel, we also have

\[ |h_{1,1}(k, \sigma) + 2k\sigma + 2|k|\sigma + i\kappa\sigma^2| \leq \left| -e^{ik|\sigma|} - e^{-|k|\sigma} + \frac{2(|k|(|k| + \kappa))}{|k|} e^{-|k|\sigma} - 2 \frac{k(|k| + \kappa)}{|k|} e^{-k\sigma} + 2k\sigma \right| \]

\[ \leq \left| -e^{-|k|\sigma} + 1 + |k|\sigma - \frac{1}{2} |k|^2 \sigma^2 \right| - \left| e^{k\sigma} - 1 \right| - \left| e^{-k\sigma} - 1 + k\sigma + i\kappa\sigma^2 \right| \]

\[ \leq \text{const.} \cdot (|k|^3\sigma^3) + (|k|^2 + |k|)(|k|^2 + |k|^2)\sigma^2 + ((|k|^3 + |k|^3)e^{ik\sigma}, \quad (81) \]

We now bound the terms \( \hat{\psi}_1^{t,2} \). Using Proposition 22 with the bound (78) and Proposition 23 as with (79), as well as inequality (134) where necessary, we have

\[ |\hat{\psi}_1^{t,2}| = \frac{1}{2} \left| e^{-|k|t(t-1)} - e^{-|k|t} \right| \int_t^1 (h_{1,1}(k, \sigma) + 2k\sigma)\hat{Q}_1(k, s)ds \]

\[ \leq \text{const.} \cdot e^{-|k|t} |e^{t} - 1| \int_t^1 |h_{1,1}(k, \sigma) + 2k\sigma|\mu_1^{(t)}(k, s)ds \]

\[ \leq \text{const.} \cdot e^{-|k|t(t-1)} |k| \int_{1}^{t+1} (1 + |k|)|\sigma| e^{k\sigma}\mu_1^{(t)}(k, s)ds \]

\[ + \text{const.} \cdot e^{-|k|t(t-1)} |k| \int_{1}^{t} (1 + |k| + (|k|^2 + |k|)\sigma)e^{k\sigma}\mu_1^{(t)}(k, s)ds \]

\[ \leq \text{const.} \left( \frac{1}{t^2} \bar{\mu}_{(t-1)}(k, t) + \frac{1}{t^{1/2}} \bar{\mu}_{(t-1)}(k, t) + \frac{1}{t} \bar{\mu}_{(t-1)}(k, t) \right), \]

which shows that \( \hat{\psi}_1^{t,2} \in B_{\mu''}.2,4 \).

For \( \hat{\psi}_2^{t,2} \), we split the integration interval into two sub-intervals, \([1, \rho]\) and \([\rho, t]\), with \( 0 < \rho < 1 \). We also rewrite the integral over the first sub-interval using (128), so that
For (84), we have, using Proposition 22 with the bound (81) and Proposition 23, with (80),

\[
\frac{1}{2} e^{-|k| t} \int_1^t \left( (h_{1,1}(k, \sigma) + 2k \sigma) \hat{Q}_1(k, s) + (2|k| + ik\sigma) \sigma \hat{Q}_1(0, s) \right) ds
\]

\[
= \frac{1}{2} e^{-|k| t} \int_1^t \left( (h_{1,1}(k, \sigma) + 2k \sigma + (2|k| + ik\sigma) \sigma) \hat{Q}_1(k, s) \right) ds
\]

\[
- \frac{1}{2} e^{-|k| t} \int_1^t (2|k| + ik\sigma) \sigma k\partial \hat{Q}_1(\xi, s) ds
\]

\[
+ \frac{1}{2} e^{-|k| t} \int_1^t \left( (h_{1,1}(k, \sigma) + 2k \sigma) \hat{Q}_1(k, s) + (2|k| + ik\sigma) \sigma \hat{Q}_1(0, s) \right) ds.
\]

For (82) we have, using Proposition 22 with the bound (81) and Proposition 23, with (80),

\[
\frac{1}{2} e^{-|k| t} \int_1^t \left| (h_{1,1}(k, \sigma) + 2k \sigma + (2|k| + ik\sigma) \sigma) \hat{Q}_1(k, s) \right| ds
\]

\[
\leq \text{const.} e^{-|k| t} \int_1^t |h_{1,1}(k, \sigma) + 2k \sigma + (2|k| + ik\sigma) \sigma| \mu_1(k, s) ds
\]

\[
\leq \text{const.} e^{-|k| t} \int_1^t \frac{1}{\sqrt{2}} \left( |k|^{3/2} + |k|^3 \right) \sigma^2 se^{k|\sigma|} \mu_1(k, s) ds
\]

\[
+ \text{const.} e^{-|k| t} \int_1^t (1 + |k| + |k|^{1/2} + |k|\sigma) e^{k|\sigma|} \mu_1(k, s) ds
\]

\[
\leq \text{const.} \left( \frac{1}{\sqrt{3}} \tilde{\mu}_{\sigma'}(k, t) + \frac{1}{\sqrt{2}} \tilde{\mu}_{\sigma'}(k, t) + \frac{1}{t^2} \tilde{\mu}_{\sigma'}(k, t) \right) \in \mathcal{B}_{\sigma', \frac{1}{2}-\delta, 2}.
\]

For (83) we have, using (135),

\[
\frac{1}{2} e^{-|k| t} \int_1^t (2|k| + ik\sigma) \sigma k\partial \hat{Q}_1(\xi, s) ds
\]

\[
\leq \text{const.} e^{-|k| t} |k|^2 \int_1^t \frac{1}{s^2} ds
\]

\[
\leq \text{const.} e^{-|k| t} |k|^2 (t^p + \log(1 + t) - 1) \in \mathcal{B}_{\sigma', 2\rho, -\infty}.
\]

For (84), we have

\[
\frac{1}{2} e^{-|k| t} \int_1^t \left( (h_{1,1}(k, \sigma) + 2k \sigma) \hat{Q}_1(k, s) + (2|k| + ik\sigma) \sigma \hat{Q}_1(0, s) \right) ds
\]

\[
\leq \text{const.} e^{-|k| t} \int_1^t \left( (h_{1,1}(k, \sigma) + 2k \sigma) \hat{Q}_1(k, s) \right) ds + \text{const.} e^{-|k| t} |k| \frac{1}{t^p},
\]

where the second term is in \(\mathcal{B}_{\sigma', 1+\rho, \infty}\) by (135). We split the remaining integral into two sub-intervals after setting \(\rho \leq 1/2\), and make use of (79) and (78), respectively. We get, using Proposition 23 to bound the second integral,

\[
e^{-|k| t} \int_1^t |(h_{1,1}(k, \sigma) + 2k \sigma)\hat{Q}_1(k, s)| ds = e^{-|k| t} \int_1^t \frac{1}{t^p} (|k|^{1/2} + |k|^2) \sigma e^{k|\sigma|} \mu_1(k, s) ds
\]

\[
+ e^{-|k| t} \int_1^t \frac{1}{t^p} (1 + |k| + (|k|^{1/2} + |k|)\sigma) e^{k|\sigma|} \mu_1(k, s) ds
\]

\[
\leq \text{const.} \left( e^{-|k|^{1/2}} (|k|^{1/2} + |k|^2) \frac{1}{t^{2p}} + \frac{1}{\sqrt{5}/2} \tilde{\mu}_{\sigma'}(k, t) + \frac{1}{\sqrt{5}/2} \tilde{\mu}_{\sigma'}(k, t) \right),
\]

where (135) allows to bound the first term, so that this expression is in \(\mathcal{B}_{\sigma', 2\rho, -\infty} \) for \(\rho \leq 1/2\). Therefore, if we choose \(\rho = 1/2\), then

\[\hat{\psi}_{3,2} \in \mathcal{B}_{\sigma', \frac{1}{2}+\frac{1}{2}}.\]

To bound \(\hat{\psi}_{3,2}^{r,2}\) we note that

\[|\hat{\psi}_{3,2}^{r,2}| = \left| e^{-|k| t} \int_1^t \sqrt{-ik\sigma} \hat{Q}_1(0, s) ds - e^{-|k| t} \int_1^t k\sigma \hat{Q}_1(k, s) ds \right|
\]

\[\leq \left( e^{-|k| t} - e^{-|k| t} \right) \int_1^t k\sigma \hat{Q}_1(k, s) ds + \left| e^{-|k| t} \int_1^t \left( \sqrt{-ik} - k \right) \sigma \hat{Q}_1(k, s) ds \right|
\]
Similarly, we have

\[ 4.7. \text{Final improvement of the bounds on } \hat{\eta}, \hat{\omega}, \text{and } \partial_t \hat{Q}_1 \]

To bound \( \hat{\psi}_4\) we simply integrate with respect to \( s \) and then apply (135),

\[
|\hat{\psi}_4| = \frac{1}{2} e^{-|k|t} \int_0^\infty \left( 2 \sqrt{-ik} + |k| + i k \sigma \right) \hat{Q}_1(0, s) ds \leq \text{const.} e^{-|k|t} \left( |k|^{1/2} + |k| \right) \frac{1}{\ell^2} + e^{-|k|t} |k| \frac{1}{\ell^4} \in B_{a', 2, \infty}.
\]

Gathering the bounds on the \( \hat{\psi}_4 \) yields (76), and by the opening remark of the proof also (77).

4.7. Final improvement of the bounds on \( \hat{Q}_0, \hat{Q}_1, \) and \( \partial_t \hat{Q}_1 \)

Using Proposition 12, (42), (67) and (76), we get

\[
\hat{\omega} \ast \hat{\psi} \in B_{a', 6, 4},
\]

\[
\hat{\psi} \ast (\hat{\omega} - \hat{\omega}_{2s, 1}) \in B_{a', 9, \infty},
\]

\[
(\hat{\psi} - \hat{\psi}_{2s, 1} - \hat{\psi}_{2s, 2}) \ast \hat{\omega}_{2s, 1} \in B_{a', 9, -4, \infty}.
\]

For the term \( \hat{\psi}_{2s, 1} + \hat{\psi}_{2s, 2} \ast \hat{\omega}_{2s, 1} \) we can proceed exactly as in Section 4.5, thanks to the fact that

\[
\sup_{z \in \mathbb{R}} \left| |z|^{n+2} |\psi_2^{(n)}(z)| \right| = \text{const.} < \infty, \quad n \geq 0.
\]

We conclude that

\[
(\hat{\psi}_{2s, 1} + \hat{\psi}_{2s, 2}) \ast \hat{\omega}_{2s, 1} \in B_{a', \infty, 4},
\]

and therefore

\[
\hat{Q}_1 \in B_{a', 9, -4, 4}. \tag{85}
\]

Similarly, we have

\[
\hat{Q}_0 \in B_{a', 9, -5, 3}, \tag{86}
\]

\[
\partial_t \hat{Q}_1 \in B_{a', 9, -5, 2}. \tag{87}
\]

In the light of (85), we define

\[
\mu_{a'}^+ := \frac{s^{9/2-\delta}}{s} \hat{\mu}_{a'}(k, s) + \frac{1}{s^4} \hat{\mu}_{a'}(k, s) \tag{88}
\]

to replace (66) from now on.

4.8. Second order in \( \hat{\eta} \) and \( \hat{\omega} \)

Applying the new bound (85) for \( \hat{Q}_1 \) in a straightforward manner, and in view of Proposition 12 and Remark 9, we find that the second order terms of \( \hat{\eta} \) and \( \hat{\omega} \) are to be extracted from \( \hat{\eta}_{1,1} - \hat{\eta}_{2s, 1} \) and \( \hat{\omega}_{1,1} - \hat{\omega}_{2s, 1} \), respectively. Inspecting the limits of these quantities motivates us, in a similar way as in the case of the leading order of \( \hat{\eta} \) and \( \hat{\omega} \), to define the functions

\[
\hat{\eta}_{2s, 2}(k, t) = -c_1 \frac{|k| - ik}{\sqrt{-ik}} e^{-\sqrt{-ik}t}, \tag{89}
\]

\[
\hat{\omega}_{2s, 2}(k, t) = c_1 (|k| - ik) e^{-\sqrt{-ik}t}, \tag{90}
\]

with \( c_1 \) as defined by (29). Note that \( \hat{\eta}_{2s, 2} \in B_{a', \infty, 1} \) and \( \hat{\omega}_{2s, 2} \in B_{a', \infty, 2} \). We now show that

\[
\hat{\eta}_{1,1} - \hat{\eta}_{2s, 1} - \hat{\eta}_{2s, 2} \in B_{a', -1, \frac{5}{2}, -6, 2, -3, -\delta}, \tag{91}
\]

\[
\hat{\omega}_{1,1} - \hat{\omega}_{2s, 1} - \hat{\omega}_{2s, 2} \in B_{a', -1, \frac{5}{2}, -5, 3, -\delta}. \tag{92}
\]
Remark 14. The bounds (86) and (85) for \( \hat{Q}_0 \) and \( \hat{Q}_1 \), respectively, also show that \( \hat{\omega}_{2,1} \in \mathcal{B}_{\sigma} \), using (133) and \( \hat{\omega}_{3,1} \in \mathcal{B}_{\sigma} \). This means, as is already mentioned in Remark 9, that only \( \hat{\omega}_{1,1} \) plays a role in (7).

**Proof.** As for the leading order term, we have

\[
\hat{\omega}_{1,1} = \frac{ik}{\kappa} \left( \hat{\eta}_{1,1} - \hat{\eta}_{as,1} \right),
\]

so that for the same reasons, the \( \mathcal{B}_{\sigma} \) space of the second order term of \( \hat{\omega} \) has indices \( p \) and \( q \) greater by 1 than that of the second order term of \( \hat{\eta} \), and thus we only present the proof for \( \hat{\eta} \).

In order to prove (91) we analyze

\[
\hat{\eta}_{1,1}(k, t) - \hat{\eta}_{as,1}(k, t) = \hat{\eta}_{as,2}(k, t) = \frac{1}{2} e^{-\kappa t} \int_1^t \left( g_{11}(k, s) \right) ds + \frac{1}{2} e^{-\kappa t} \int_1^t \left( g_{11}(k, s) \right) ds.
\]

We rewrite this expression as a sum of terms which can easily be bounded. Namely,

\[
\hat{\eta}_{1,1}(k, t) - \hat{\eta}_{as,1}(k, t) - \hat{\eta}_{as,2}(k, t) = \sum_{i=1}^6 \hat{\eta}_{i}^{t,2},
\]

with

\[
\hat{\eta}_1^{\cdot,2} = \frac{1}{2} \left( e^{-\kappa t} - e^{-\kappa t} \right) \int_1^t (g_{11}(k, s) \cdot \kappa) \hat{Q}_1(k, s) ds,
\]

\[
\hat{\eta}_2^{\cdot,2} = \frac{1}{2} e^{-\kappa t} \int_1^t \left( g_{11}(k, s) \cdot \kappa \right) \hat{Q}_1(k, s) + \frac{1}{2} e^{-\kappa t} \int_1^t \left( e^{-\kappa t} \cdot \kappa \right) \hat{Q}_1(k, s) ds,
\]

\[
\hat{\eta}_3^{\cdot,2} = \frac{1}{2} e^{-\kappa t} \int_1^t \left( g_{11}(k, s) \cdot \kappa \right) \hat{Q}_1(k, s) ds + \frac{1}{2} e^{-\kappa t} \int_1^t \left( e^{-\kappa t} \cdot \kappa \right) \hat{Q}_1(k, s) ds,
\]

\[
\hat{\eta}_4^{\cdot,2} = \frac{1}{2} e^{-\kappa t} \int_1^t \left( \kappa \hat{Q}_1(k, s) + \hat{Q}_1(k, s) \right) ds,
\]

\[
\hat{\eta}_5^{\cdot,2} = \frac{1}{2} e^{-\kappa t} \int_1^t \left( \kappa \hat{Q}_1(k, s) + \hat{Q}_1(k, s) \right) ds + \frac{1}{2} e^{-\kappa t} \int_1^t \left( e^{-\kappa t} \cdot \kappa \right) \hat{Q}_1(k, s) ds,
\]

\[
\hat{\eta}_6^{\cdot,2} = e^{-\kappa t} \int_1^t \left( e^{-\kappa t} \cdot \kappa \right) \hat{Q}_1(k, s) ds.
\]

The term \( \hat{\eta}_1^{\cdot,2} \) must be bounded by Propositions 19 and 20 for \( |k| \leq 1 \) and \( |k| > 1 \) separately. We use the bounds

\[
\left| g_{11}(k, s) \cdot \kappa \right| \leq \text{const.} e^{A \cdot \sigma} \min \{ 1, |A| \sigma + 1 \} \quad \text{for } |k| \leq 1,
\]

\[
\left| g_{11}(k, s) \cdot \kappa \right| \leq \text{const.} e^{A \cdot \sigma} \min \{ 1 + |A| \sigma, |A|^2 \sigma + 1 \} \quad \text{for } |k| > 1,
\]

which can easily be obtained from (95). For \( |k| \leq 1 \) we have

\[
| \hat{\eta}_{1}^{\cdot,2} | = \left| \frac{1}{2} \left( e^{-\kappa t} - e^{-\kappa t} \right) \int_1^t \left( g_{11}(k, s) \cdot \kappa \right) \hat{Q}_1(k, s) ds \right|
\]

\[
\leq \text{const.} e^{A \cdot \sigma} \cdot |A| \cdot \int_1^t |A| \sigma e^{A \cdot \sigma} \mu_{\sigma}(k, s) ds + \text{const.} e^{A \cdot \sigma} \cdot |A| \cdot \int_1^t |A| \sigma e^{A \cdot \sigma} \mu_{\sigma}(k, s) ds,
\]

\[
\leq \text{const.} \left( \frac{1}{t^2} \hat{\mu}_{\sigma}(k, t) + \frac{1}{t^2} \hat{\mu}_{\sigma}(k, t) + \frac{1}{t^3} \hat{\mu}_{\sigma}(k, t) \right),
\]

and for \( |k| > 1 \), using (134) to deal with the spurious \( |A| \) factor,

\[
| \hat{\eta}_{1}^{\cdot,2} | = \left| \frac{1}{2} \left( e^{-\kappa t} - e^{-\kappa t} \right) \int_1^t \left( g_{11}(k, s) \cdot \kappa \right) \hat{Q}_1(k, s) ds \right|
\]

\[
\leq \text{const.} e^{A \cdot \sigma} \cdot |A| \cdot \int_1^t |A| \sigma e^{A \cdot \sigma} \mu_{\sigma}(k, s) ds,
\]

\[
\leq \text{const.} e^{A \cdot \sigma} \cdot |A| \cdot \int_1^t |A| \sigma e^{A \cdot \sigma} \mu_{\sigma}(k, s) ds.
\]
This shows that $\tilde{\eta}_{1,2}^\tau$ is in $\mathcal{B}_{a^\tau-1,2}^{\gamma/2-\varepsilon,2}$.

For $\tilde{\eta}_{2,2}^\tau$ we use the fact that, using (128),

$$
\left( g_{1,1}(k, \sigma) - \frac{2}{ik} \kappa \sigma \right) \tilde{Q}_1(k, s) + \frac{2|k|}{\sqrt{-ik}} \sigma \tilde{Q}_1(0, s) = \left( g_{1,1}(k, \sigma) - \frac{2}{ik} \kappa \sigma + \frac{2|k|}{\sqrt{-ik}} \right) \tilde{Q}_1(k, s) - \frac{2|k|}{\sqrt{-ik}} \sigma k \delta_k \tilde{Q}_1(\zeta, s),
$$

for some $\zeta \in [0, k]$. We analyze the expression

$$
g_{1,1}(k, \sigma) - \frac{2}{ik} \kappa \sigma + \frac{2|k|}{\sqrt{-ik}} \sigma = \frac{\kappa}{ik} \left( e^{i\sigma} + \frac{(|k| + \kappa)^2}{ik} e^{-i\sigma} - \frac{2|k|(|k| + \kappa)}{\kappa} e^{-|\sigma|} - \frac{2\sqrt{-ik}}{\kappa} \right)
$$

in some more detail. A straightforward bound is

$$
\left| g_{1,1}(k, \sigma) - \frac{2}{ik} \kappa \sigma + \frac{2|k|}{\sqrt{-ik}} \sigma \right| = \frac{\kappa}{ik} \left( e^{i\sigma} - 1 \right) \left( 1 - (e^{-i\sigma} - 1) \right) + \frac{2|k|^2 + 2|k|\kappa}{\sqrt{-ik}} \left( (e^{-i\sigma} - 1) - (e^{-|\sigma|} - 1) \right)
$$

but we may also cancel leading order terms so that

$$
g_{1,1}(k, \sigma) - \frac{2}{ik} \kappa \sigma + \frac{2|k|}{\sqrt{-ik}} \sigma = \frac{\kappa}{ik} \left( e^{i\sigma} - 1 - \kappa \sigma - \frac{1}{2} \kappa^2 \sigma^2 - \frac{1}{\kappa} \kappa^2 \sigma^2 \right)
$$

where the third term reduces to $-2i|k| (\kappa - \sqrt{-ik}) \sigma / k$. This yields

$$
\left| g_{1,1}(k, \sigma) - \frac{2}{ik} \kappa \sigma + \frac{2|k|}{\sqrt{-ik}} \sigma \right| \leq \begin{cases} 
\text{const.} \left| \frac{1 + |A_-|}{|k|} \right| e^{iA_-} & \text{for } |k| \leq 1 \\
\text{const.} \left| \frac{1 + |A_-|}{|k|} \right| e^{iA_-} & \text{for } |k| > 1.
\end{cases}
$$

Collecting (93) and (94) we have

$$
\left| g_{1,1}(k, \sigma) - \frac{2}{ik} \kappa \sigma + \frac{2|k|}{\sqrt{-ik}} \sigma \right| \leq \begin{cases} 
\text{const.} \min \left( 1 + |A_-|, |A_-|^2 (|A_-|^2 + 1) \right) e^{iA_-} & \text{for } |k| \leq 1 \\
\text{const.} \min \left( 1 + |A_-| (|A_-| + 1), |A_-|^3 (|A_-|^2 + 1) \right) e^{iA_-} & \text{for } |k| > 1.
\end{cases}
$$

We can now bound $\tilde{\eta}_{2,2}^\tau$ by splitting it into two terms. We have

$$
\left| \tilde{\eta}_{2,2}^\tau \right| = \frac{1}{2} \left| e^{-xt} \int_{t}^{t} \left( \left( g_{1,1}(k, \sigma) - \frac{2}{ik} \kappa \sigma \right) \tilde{Q}_1(k, s) + \frac{2|k|}{\sqrt{-ik}} \sigma \tilde{Q}_1(0, s) \right) ds \right|
$$

We collect (96) and (97)
For the term (96) we get, for $|k| \leq 1$,
$$\left| \frac{1}{2} e^{-kt} \int_0^t \left( g_{1,1}(k, \sigma) - \frac{2}{ik} \kappa \sigma + \frac{2 |k|}{\sqrt{-ik}} \sigma \right) \hat{Q}_1(k, s) ds \right| \leq \text{const.} \ e^{\lambda t} \int_0^t |\Lambda_-|^2 (\sigma^2 + 2) e^{\lambda_- |\sigma|^2} \mu_1^\mu(k, s) ds + \text{const.} \ e^{\lambda_- t} \int_0^t (1 + |\Lambda_-|) \sigma e^{\lambda_- |\sigma|^2} \mu_1^\mu(k, s) ds$$
and thus
$$\hat{\eta}_{1,2} \in B_{a^\gamma, \infty, 3-\delta}.$$

To bound $\hat{\eta}_{3,2}$ we can rearrange the terms and use (128) to get
$$\hat{\eta}_{3,2} = e^{-kt} (e^\kappa - 1) \int_0^t \frac{k}{ik} \kappa \sigma \hat{Q}_1(k, s) ds - e^{-\sqrt{-ik}t} \int_0^t \frac{ik}{\sqrt{-ik}} \sigma \hat{Q}_1(0, s) ds$$
$$+ e^{-kt} \int_0^t \left( \frac{k^2}{ik} (e^\kappa - 1) - \frac{ik}{\sqrt{-ik}} \right) \sigma \hat{Q}_1(k, s) ds + e^{-xt} \int_0^t \frac{ik}{\sqrt{-ik}} k \sigma \partial_k \hat{Q}_1(\zeta, s) ds,$n for some $\zeta \in [0, k]$. We then get, using for the first term (131),
$$|\hat{\eta}_{3,2}| \leq \text{const.} \ e^{-\sqrt{-ik}t} \left| k \right|^{3/2} \left| t \right|^{1/2} \left| \int_1^t \sigma \hat{Q}_1(0, s) ds \right|$$
$$+ \text{const.} \ e^{-kt} \int_0^t \sqrt{-ik} k \sigma \partial_k \hat{Q}_1(\zeta, s) ds + \text{const.} \ e^{-kt} \int_0^t \left( \frac{k^2}{ik} (e^\kappa - 1) + \sqrt{-ik} \right) \sigma \hat{Q}_1(k, s) ds.$n For the third term we use
$$\left| \frac{k^2}{ik} (e^\kappa - 1) + \sqrt{-ik} \right| = -ik (e^\kappa - 1) - (e^\kappa - 1 - \kappa) - \kappa + \sqrt{-ik}$$
which is bounded above, using (130), by
$$\text{const.} \left( |k| \left\| \Lambda_- e^{\lambda_- k} \right\| + |\Lambda_-|^2 e^{\lambda_- k} + \min \{|\Lambda_-|^2, |\Lambda_-|^2\} \right) \leq \text{const.} \ |\Lambda_-|^2 e^{\lambda_- k}.$$
We therefore have
$$|\hat{\eta}_{3,2}| \leq \text{const.} \ e^{-\sqrt{-ik}t} \left( \left| k \right| t + \left| k \right|^{3/2} \log(1 + t) \right) + \text{const.} \ e^{\lambda_- t} e^{\lambda_- k} \int_0^t |\Lambda_-| \sigma e^{\lambda_- |\sigma|^2} \mu_1^\mu(k, s) ds,$n which, due to (136), Propositions 19 and 20, and using (134) to trade, where appropriate, one factor of $|\Lambda_-|$ for a factor $t^{-1}$, shows that $\hat{\eta}_{3,2} \in B_{a^\gamma, -1, 4-\delta, 2}$.

To bound $\hat{\eta}_{4,2}$ we rearrange the terms using (128), for some $\zeta \in [0, k]$, such that
$$|\hat{\eta}_{4,2}| = e^{-xt} \int_0^t \left( \frac{K}{ik} \kappa \hat{Q}_1(k, s) + \hat{Q}_1(0, s) \right) \sigma ds.$$
A.1. Explicit expressions for the asymptotes

We then use (136) to show that $\hat{\eta}_4^{(-)} \in B_{a^{-\infty,2}}$.

For $\hat{\eta}_5^{(-)}$ we use (131) and (136), so that

$$|\hat{\eta}_5^{(-)}| = \left| (e^{-xt} - e^{-\sqrt{-it}k}) \int_t^\infty \left( 1 + \frac{|k|}{\sqrt{-it}} \right) \sigma \hat{Q}_4(0, s) ds \right| \leq \text{const.} \left| e^{-\sqrt{-it}k} \right| |k|^{3/2} t (1 + |k|^{1/2}) \in B_{a^{-\infty,2}}.$$

Finally, using (136) to bound $\hat{\eta}_6^{(-)}$, we get

$$|\hat{\eta}_6^{(-)}| = \left| e^{-\sqrt{-it}k} \int_t^\infty \left( 1 + \frac{|k| - ik}{\sqrt{-it}} \right) \sigma \hat{Q}_4(0, s) ds \right| \leq \text{const.} \left| e^{-\sqrt{-it}k} \right| (1 + |k|^{1/2}) \frac{1}{t^2} \in B_{a^{-\infty,2}}.$$

Gathering the bounds on the $\hat{\eta}_i^{(-)}$ terms yields (91), and by the opening remark of the proof also (92).

\section*{Appendix}

A.1. Explicit expressions for the asymptotes

The following are explicit functions for which Theorem 1 is true:

$$\varphi_1(z) = -\frac{1}{4\sqrt{\pi}} \frac{r + 1 - z^2 + rz + 2z}{r^3 \sqrt{r + 1}}, \quad (98)$$

$$\psi_1(z) = -\frac{1}{4\sqrt{\pi}} \frac{r + 1 - z^2 - rz - 2z}{r^3 \sqrt{r + 1}}, \quad (99)$$

$$\varphi_{2,1}(z) = -\frac{1}{2\pi} \frac{2z}{r^4}, \quad (100)$$

$$\varphi_{2,2}(z) = \frac{1}{2\pi} \frac{1 - z^2}{r^4}, \quad (101)$$

$$\psi_{2,1}(z) = -\frac{1}{r^4} \frac{1 - z^2}{2\pi}, \quad (102)$$

$$\psi_{2,2}(z) = -\frac{2}{2\pi} \frac{2z}{r^4}, \quad (103)$$

$$\eta_W(z) = -\frac{1}{2\sqrt{\pi z^3}} \begin{cases} e^{-1/4z^4}, & z \geq 0 \\ 0, & z < 0 \end{cases}, \quad (104)$$

$$\omega_W(z) = \frac{1}{4\sqrt{\pi z^3}} \begin{cases} (1 - 2z)e^{-1/4z^4}, & z \geq 0 \\ 0, & z < 0 \end{cases}, \quad (105)$$

$$\eta_B(z) = -\frac{1}{4\pi z^3} \begin{cases} 2z + \sqrt{\pi z} (1 - 2z) e^{-1/4z^4} (1 - \text{erf}(1/\sqrt{4|z|})), & z \geq 0 \\ 2z + \sqrt{\pi z} (1 - 2z) e^{-1/4z^4} (1 - \text{erf}(1/\sqrt{4|z|})), & z < 0 \end{cases}, \quad (106)$$

$$\omega_B(z) = \frac{1}{8\pi z^3} \begin{cases} 2z (1 - 4z) + \sqrt{\pi z} (1 - 6z) e^{-1/4z^4} (1 - \text{erf}(1/\sqrt{4|z|})), & z \geq 0 \\ 2z (1 - 4z) + \sqrt{\pi z} (1 - 6z) e^{-1/4z^4} (1 - \text{erf}(1/\sqrt{4|z|})), & z < 0 \end{cases}, \quad (107)$$

where

$$r = \sqrt{1 + z^2}.$$
A.2. Integral representation of the solution

We recall the integral equations representing the solution

\[ \hat{u} = -\hat{h} + \hat{\phi}, \]
\[ \hat{v} = \hat{\omega} + \hat{\psi}, \]
as obtained in [1]. For \( k \in \mathbb{R} \setminus \{0\} \) and \( \tau = t - 1 \geq 0 \), the functions \( K_n \) are defined by,

\[ K_n(k, \tau) = \frac{1}{2} e^{-|k|\tau}, \quad \text{for } n = 1, 2, \]
\[ K_3(k, \tau) = \frac{1}{2i} (e^{ik\tau} - e^{-ik\tau}), \]

and the functions \( G_n \) by,

\[ G_n(k, \tau) = \frac{1}{2} e^{-|k|\tau}, \quad \text{for } n \in 1, 2, \]
\[ G_3(k, \tau) = \frac{|k|}{2i} (e^{ik\tau} - e^{-ik\tau}). \]

Furthermore, for \( t \geq 1 \), and \( n = 1, 2, 3 \), the intervals \( I_n \) are defined by, \( I_1 = [1, t] \), and \( I_n = [t, \infty) \), otherwise. Using this notation an integral representation of the solution is given by

\[ \hat{h} = \sum_{m=0}^{\infty} \sum_{n=1}^{3} \hat{h}_{n,m}, \quad \hat{\omega} = \sum_{m=0}^{\infty} \sum_{n=1}^{3} \hat{\omega}_{n,m}, \]
\[ \hat{\phi} = \sum_{m=0}^{\infty} \sum_{n=1}^{3} \hat{\phi}_{n,m}, \quad \hat{\psi} = \sum_{m=0}^{\infty} \sum_{n=1}^{3} \hat{\psi}_{n,m}, \]

with

\[ \hat{h}_{n,m}(k, t) = K_n(k, t - 1) \int_{I_{n,m}} G_{m,k}(k, s - 1) \hat{Q}_m(k, s) \, ds, \]
\[ \hat{\omega}_{n,m}(k, t) = K_n(k, t - 1) \int_{I_{n,m}} F_{m,n}(k, s - 1) \hat{Q}_m(k, s) \, ds, \]
\[ \hat{\phi}_{n,m}(k, t) = G_n(k, t - 1) \int_{I_{n,m}} k_{n,m}(k, s - 1) \hat{Q}_m(k, s) \, ds, \]
\[ \hat{\psi}_{n,m}(k, t) = G_n(k, t - 1) \int_{I_{n,m}} h_{n,m}(k, s - 1) \hat{Q}_m(k, s) \, ds, \]

with \( G_n, K_n \) and \( I_n \) as defined above, \( \hat{Q}_m \) as defined in (14) and (15), \( \sigma = s - 1 \), with

\[ g_{1,0}(k, \sigma) = \frac{\kappa}{ik} \left( \frac{ik}{\kappa} e^{i\sigma} - \frac{(|k| + \kappa)^2}{\kappa} e^{-i\sigma} + 2 (|k| + \kappa) e^{-|ki|\sigma} \right), \]
\[ g_{2,0}(k, \sigma) = \kappa \left( -\frac{ik}{\kappa} \frac{(|k| + \kappa)^2}{\kappa} e^{-i\sigma} + 2 (|k| + \kappa) e^{-|ki|\sigma} \right), \]
\[ g_{3,0}(k, \sigma) = \frac{\kappa}{ik} e^{-i\sigma}, \]
\[ g_{1,1}(k, \sigma) = \frac{\kappa}{ik} \left( e^{i\sigma} + \frac{(|k| + \kappa)^2}{ik} e^{-i\sigma} - 2 \frac{|k| (|k| + \kappa)}{ik} e^{-|ki|\sigma} \right), \]
\[ g_{2,1}(k, \sigma) = \kappa \left( 1 + \frac{(|k| + \kappa)^2}{ik} \right) e^{-i\sigma} - 2 \frac{|k| (|k| + \kappa)}{ik} e^{-|ki|\sigma}, \]
\[ g_{3,1}(k, \sigma) = e^{i\sigma}, \]

with \( f_{1,m}(k, \sigma) = \frac{ik}{\kappa} g_{1,1}(k, \sigma) \), \( f_{3,1}(k, \sigma) = -\frac{ik}{\kappa} g_{3,1}(k, \sigma) \), \( g_{2,0}(k, \sigma) = \frac{ik}{\kappa} (g_{2,0}(k, \sigma) + 2e^{-i\sigma}) \), and \( f_{2,1}(k, \sigma) = \frac{ik}{\kappa} g_{2,1}(k, \sigma) - 2e^{-i\sigma} \), with

\[ k_{1,0}(k, \sigma) = \frac{|k|}{ik} \left( \frac{ik}{|k|} e^{i|\sigma|} + \frac{(|k| + \kappa)^2}{|k|} e^{-i|\sigma|} - 2(|k| + \kappa) e^{-|ki|\sigma} \right), \]
\[ k_{2,0}(k, \sigma) = \frac{|k|}{ik} \left( \left( -\frac{ik}{|k|} + \frac{(|k| + \kappa)^2}{|k|} \right) e^{-|k|\sigma} - 2 (|k| + \kappa) e^{-e^\sigma} \right), \]

\[ k_{3,0}(k, \sigma) = -\frac{ik}{|k|} e^{-|k|\sigma}, \]

\[ k_{1,1}(k, \sigma) = \frac{|k|}{ik} \left( \frac{(|k| + \kappa)^2}{ik} e^{-ik\sigma} + 2 \frac{\kappa}{ik} (|k| + \kappa) e^{-e^\sigma} \right), \]

\[ k_{2,1}(k, \sigma) = \frac{|k|}{ik} \left( \frac{(1 + |k| + \kappa)^2}{ik} e^{-ik\sigma} + 2 \frac{\kappa}{ik} (|k| + \kappa) e^{-e^\sigma} \right), \]

\[ k_{3,1}(k, \sigma) = e^{-|k|\sigma}, \]

and with \( h_{1,m}(k, \sigma) = -\frac{ik}{|k|} k_{1,m}(k, \sigma), h_{3,m}(k, \sigma) = \frac{ik}{|k|} k_{3,m}(k, \sigma), h_{2,0}(k, \sigma) = -\frac{ik}{|k|} (k_{2,0}(k, \sigma) + 2e^{-|k|\sigma}), \) and \( h_{2,1}(k, \sigma) = -\frac{ik}{|k|} k_{2,1}(k, \sigma) + 2e^{-|k|\sigma}. \)

### A.3. Technical aspects of computations

**Mean-value theorem applied to \( \hat{Q}_1 \)**

Applying the mean-value theorem in the variable \( k \) we have

\[ \hat{Q}_1(k, s) = \hat{Q}_1(0, s) + k \partial_k \hat{Q}_1 (\zeta, s), \]

with some \( \zeta \in [0, k] \) and (see [3])

\[ \partial_k \hat{Q}_1 \in \mathcal{B}_{\alpha, \frac{1}{2}, 2}. \]

The bound on \( \partial_k \hat{Q}_1 \) is improved in Sections 4.5.1 and 4.7, where it is proved that this function is in \( \mathcal{B}_{\alpha^*, 2, 2} \) and \( \mathcal{B}_{\alpha^*, \frac{3}{2} - \delta, 2} \), respectively.

**Inequalities for \( k \) and \( \kappa \)**

Since \( \kappa = \sqrt{k^2 - ik} \) and \( \Lambda_\kappa = \text{Re}(\kappa) = -\frac{1}{2} \sqrt{2k^2 + k^4 + 2k^2} \), we have

\[ |\kappa| = (k^2 + k^4)^{1/4} \leq |k|^{1/2} + |k| \leq 2^{3/4} |\kappa| \leq 2^{3/4}(1 + |k|), \]

and that

\[ |\kappa| \leq |\Lambda_\kappa| \leq |\kappa| \leq \sqrt{2} |\Lambda_\kappa|, \]

from which we get, for \( \sigma \geq 0 \),

\[ e^{A_\kappa \sigma} \leq e^{-|k|\sigma}. \]

The following inequalities are used throughout the proofs

\[ \left| \kappa - \sqrt{-ik} \right| = \left| \frac{k^2 - ik - (-ik)}{\sqrt{k^2 - ik + \sqrt{-ik}}} \right| \leq \frac{k^2}{2 \sqrt{|\kappa|}} \leq \text{const.} |\kappa|^{3/2} \leq \text{const.} \min(|\Lambda_\kappa|^2, |\Lambda_\kappa|^3), \]

and

\[ e^{-\sqrt{-\kappa}t} - e^{-\sqrt{-\kappa} t} \leq \left| e^{-\sqrt{-\kappa} \left( e^{(\sqrt{-\kappa} - \kappa) t} - 1 \right)} \right| \leq \text{const.} \left| e^{-\sqrt{-\kappa} t} \right| \left| \sqrt{-ik} - \kappa \right| t \leq \text{const.} \left| e^{-\sqrt{-\kappa} t} \right| |k|^{3/2} t. \]

**Some inequalities for \( \tilde{\mu}_\alpha \) and \( \tilde{\mu}_0 \)**

Using the notation introduced in Definition 4, we have for \( \alpha \geq 0 \) and \( 1 \leq t < 2 \),

\[ \tilde{\mu}_\alpha(k, t) \leq \text{const.} \tilde{\mu}_\alpha(k, t) \leq \text{const.} \]

\[ \mu_\alpha(k, t) \leq \text{const.} \tilde{\mu}_\alpha(k, t) \leq \text{const.} \]
and that for $t \geq 2$ and $\beta \geq 0$,
\begin{align*}
    e^{-|k(r-1)|} \mu_{a,r}(k,t) & \leq \text{const.} \ e^{-|k(r-1)|} \leq \text{const.} \ \tilde{\mu}_{p}(k,t), \\
    e^{A_{-t}} \mu_{a,r}(k,t) & \leq \text{const.} \ e^{A_{-t}} \leq \text{const.} \ \tilde{\mu}_{p}(k,t),
\end{align*}
\smallskip
such that we have, for all $t \geq 0$,
\begin{alignat}{2}
    e^{-|k(r-1)|} \mu_{a,r}(k,t) & \leq \text{const.} \ \tilde{\mu}_{a}(k,t), \quad (132) \\
    e^{A_{-t}} \mu_{a,r}(k,t) & \leq \text{const.} \ \tilde{\mu}_{a}(k,t). \quad (133)
\end{alignat}

Another important inequality used in the proofs is that, for $p \geq 0$,
\begin{equation}
|k|^p \mu_{a,r}(k,t) \leq \text{const.} \ rac{|k|^p}{t^p} \mu_{a-p,r}(k,t),
\end{equation}
which is due to the fact that
\begin{equation}
|k|^p \mu_{a,r}(k,t) = \frac{t^p}{t^p} \ rac{|k|^p}{1 + (|k|^p)^p} \leq \frac{1}{t^p} \left( \frac{|k|^p}{1 + (|k|^p)^p} \right).
\end{equation}

Function spaces for some exponential functions

**Proposition 15.** For $\alpha \geq 1$, $p, q \geq 0$, we have
\begin{align}
    & k^p e^{-|k|t} \in \mathcal{B}_{a,p,\infty}, \quad p \geq 0, \tag{135} \\
    & k^q e^{-\sqrt{\lambda}t}, \ k^2 e^{-\tilde{\alpha}t} \in \mathcal{B}_{a,\infty,2q}, \quad q \geq 0. \tag{136}
\end{align}

**Proof.** Using **Definition 5** for functions belonging to $\mathcal{B}_{a,p,\infty}$ spaces, we must have
\begin{equation}
\sup_{t \geq 1} \sup_{k \in \mathbb{R} \setminus \{0\}} \frac{|k|^p e^{-|k|t}}{t^p} \mu_{a}(k,t) = \sup_{t \geq 1} \sup_{k \in \mathbb{R} \setminus \{0\}} (|k|^p(1 + (|k|^p)^p)) e^{-|k|t} < \infty.
\end{equation}

We use the change of variable $z = kt$, so that
\begin{equation}
\sup_{t \geq 1} \sup_{z \in \mathbb{R} \setminus \{0\}} |z|^p(1 + |z|^p) e^{-|z|} < \infty.
\end{equation}

Similarly we have
\begin{equation}
\sup_{t \geq 1} \sup_{k \in \mathbb{R} \setminus \{0\}} \frac{|k|^q e^{-\sqrt{k}t}}{t^q} \mu_{a}(k,t) = \sup_{t \geq 1} \sup_{k \in \mathbb{R} \setminus \{0\}} (|k|^q(1 + (|k|^q)^q)) e^{-\sqrt{k}t} < \infty,
\end{equation}
and using the change of variable $z = k_2 t$, we get
\begin{equation}
\sup_{t \geq 1} \sup_{z \in \mathbb{R} \setminus \{0\}} |z|^q(1 + |z|^q) e^{-\sqrt{|z|}} < \infty.
\end{equation}

For the functions $k^2 e^{-t} \tilde{\alpha}$ we have
\begin{equation}
\sup_{t \geq 1} \sup_{k \in \mathbb{R} \setminus \{0\}} \frac{|k|^2 e^{-t}}{t^2} \mu_{a}(k,t) = \sup_{t \geq 1} \sup_{k \in \mathbb{R} \setminus \{0\}} (|k|^2(1 + (|k|^2)^2)) e^{A_{-t}} \leq \sup_{t \geq 1} \sup_{k \in \mathbb{R} \setminus \{0\}} (|A_{-}|t)^2q(1 + (|A_{-}|t)^2ar)e^{A_{-t}},
\end{equation}
and with the change of variable $z = |A_{-}|t$
\begin{equation}
\sup_{t \geq 1} \sup_{z \in \mathbb{R} \setminus \{0\}} |z|^2q(1 + |z|^2ar) e^{-z} < \infty. \quad \square
\end{equation}

A.4. Bounds on convolution

We present variants of Proposition 9 and Corollary 10 from [1], which give bounds on convolution products in $\mathcal{B}_{a,p,q}$ spaces.
Proposition 16 (Convolution). Let $\alpha > 1$, $s \geq r \geq 0$, and let $a, b$ be continuous functions from $\mathbb{R} \setminus \{0\} \times [1, \infty)$ to $\mathbb{C}$ satisfying the bounds,
\[
|a(k, t)| \leq \mu_{\alpha, r}(k, t),
|b(k, t)| \leq \mu_{\alpha, s}(k, t),
\]
with $\mu_{\alpha, r}$ and $\mu_{\alpha, s}$ as given in Definition 4. Then, the convolution $a \ast b$ is a continuous function from $\mathbb{R} \times [1, \infty)$ to $\mathbb{C}$ and we have the bound
\[
|(a \ast b)(k, t)| \leq \text{const.} \frac{1}{t^s} \mu_{\alpha, r}(k, t),
\]
uniformly in $t \geq 1$, $k \in \mathbb{R}$.

Proof. We begin by splitting the integration interval into three sub-intervals, so that
\[
2\pi |(a \ast b)(k, t)| \leq \int_{-\infty}^{\infty} \mu_{\alpha, r}(k', t) \mu_{\alpha, s}(k - k', t) \, dk'
= \int_{-k/2}^{-k/2} \cdots \, dk' + \int_{k/2}^{\infty} \cdots \, dk' + \int_{-k/2}^{k/2} \cdots \, dk',
\]
where we only consider $k > 0$ since the functions $\mu_{\alpha, r}$ and $\mu_{\alpha, s}$ are even with respect to $k$. We first note that
\[
\int_{-\infty}^{-k/2} \mu_{\alpha, r}(k', t) \mu_{\alpha, s}(k - k', t) \, dk' + \int_{k/2}^{\infty} \mu_{\alpha, r}(k', t) \mu_{\alpha, s}(k - k', t) \, dk' \leq \text{const.} \mu_{\alpha, r}(-k/2, t) \int_{\mathbb{R}} \mu_{\alpha, s}(k - k', t) \, dk' \leq \text{const.} \, \frac{1}{t^s} \mu_{\alpha, r}(k, t),
\]
where the factor $t^{-s}$ arises from the change of variables used in the integral. For $kt' \leq 1$, we have $\frac{1}{t} \leq \mu_{\alpha, r} \leq 1$, so that
\[
\int_{-k/2}^{-k/2} \mu_{\alpha, r}(k', t) \mu_{\alpha, s}(k - k', t) \, dk' \leq \int_{\mathbb{R}} \mu_{\alpha, s}(k - k', t) \, dk' \leq (\text{const.} \mu_{\alpha, r}(k, t)) \frac{\text{const.}}{t^s}.
\]
For $kt' > 1$, we also have $kt'' > 1$, and furthermore
\[
\frac{\mu_{\alpha, s}(k, t)}{\mu_{\alpha, r}(k, t)} = \frac{1 + (|k|t')^\alpha}{1 + (|k|t')^\alpha} \leq \frac{2(|k|t')^\alpha}{(|k|t')^\alpha} = 2t^{\alpha(r-s)},
\]
which shows that
\[
\int_{-k/2}^{k/2} \mu_{\alpha, r}(k', t) \mu_{\alpha, s}(k - k', t) \, dk' \leq \mu_{\alpha, s}(k/2, t) \int_{\mathbb{R}} \mu_{\alpha, r}(k', t) \, dk' \leq \mu_{\alpha, r}(k/2, t) 2t^{\alpha(r-s)} \frac{\text{const.}}{t^s},
\]
which, since $\alpha > 1$ and $s \geq r$, is bounded by a multiple of $\mu_{\alpha, r}(k, t)/t^s$. Gathering the bounds yields (137). \qed

Corollary 17. Let $\alpha_i > 1$, and, for $i = 1, 2$ let $p_i, q_i \geq 0$. Let $\hat{f}_i \in \mathcal{B}_{a_i, p_i, q_i}$, and let
\[
\alpha = \min\{\alpha_1, \alpha_2\},
\]
\[
p = \min\{p_1 + p_2 + 1, p_1 + q_2 + 2, p_2 + q_1 + 2\},
\]
\[
q = q_1 + q_2 + 2.
\]
Then $\hat{f}_1 \ast \hat{f}_2 \in \mathcal{B}_{a, p, q}$ and there exists a constant $C$, dependent only on $\alpha$, such that
\[
\left\| \hat{f}_1 \ast \hat{f}_2; \mathcal{B}_{a, p, q} \right\| \leq C \left\| \hat{f}_1; \mathcal{B}_{a_1, p_1, q_1} \right\| \cdot \left\| \hat{f}_2; \mathcal{B}_{a_2, p_2, q_2} \right\|.
\]

Proof. Using that $\mathcal{B}_{a_1, p_1, q_1} \subset \mathcal{B}_{\min\{\alpha_1, \alpha_2\}, p_1, q_1}$, this is an immediate consequence of Proposition 16. \qed

Proposition 18 (Convolution with $|\kappa|^{-1}$ Discontinuity). Let $\alpha_i > 1$, and, for $i = 1, 2$ let $p_i, q_i \geq 0$. Let $\hat{f} \in \mathcal{B}_{a_1, p_1, q_1}$ and $\kappa \cdot \hat{g} \in \mathcal{B}_{a_2, p_2, q_2}$, and let
\[
\alpha = \min\{\alpha_1, \alpha_2\},
\]
\[
p = \min\left\{p_1 + p_2 + 1, \frac{1}{2}, p_1 + q_2 + 1\right\},
\]
\[
q = \min\left\{q_1 + p_2 + 1, \frac{1}{2}, q_1 + q_2 + 1\right\}.
\]
Then \( \hat{f} \ast \hat{g} \in \mathcal{B}_{a,p,q} \) and there exists a constant \( C \), dependent only on \( \alpha \), such that

\[
\| \hat{f} \ast \hat{g} ; \mathcal{B}_{a,p,q} \| \leq C \left( \| \hat{f} ; \mathcal{B}_{a_1,p_1,q_1} \| \cdot \| \hat{g} ; \mathcal{B}_{a_2,p_2,q_2} \| \right).
\]

**Proof.** This proposition is a consequence of Proposition 11 of [3]. \( \square \)

### A.5. Convolution with the semi-groups \( e^{A_{\alpha}t} \) and \( e^{-|k|t} \)

In an effort of self-consistency, we present the results for the convolution with the semi-groups \( e^{A_{\alpha}t} \) and \( e^{-|k|t} \) which are all proved in [1]. In order to bound the integrals over the interval \([1, t]\) we systematically split them into integrals over \([1, \frac{1}{1+\alpha}] \) and integrals over \([\frac{1}{1+\alpha}, t]\) and bound the resulting terms separately. The range for the parameter \( \beta \) has been extended to include values between 0 and 1 using Hölder’s inequality in the propositions for the intervals \([t+1/2, t]\) and \([t, \infty)\). In practice, when a logarithmic bound is found we use that for all \( \delta \in (0, 1) \) there exists a constant such that

\[
\log (1+t) \leq \text{const. } t^\delta,
\]

in order to present a bound in terms of \( \mathcal{B}_{a,p,q} \) spaces.

**Proposition 19.** Let \( \alpha \geq 0 \), \( r \geq 0 \) and \( \delta \geq 0 \) and \( \gamma + 1 \geq \beta \geq 0 \). Then,

\[
e^{-|\lambda| t} \int_1^t e^{-|\lambda|(s-1)} |\lambda|^{-\beta} \frac{(s-1)^\gamma}{s^\delta} \mu_{a,r}(k, s) ds \leq \begin{cases} \text{const. } \frac{1}{t^\gamma} \tilde{\mu}_{a}(k, t), & \text{if } \delta > \gamma + 1 \\ \log(1+t) & \text{if } \delta = \gamma + 1 \\ \frac{1}{t^\delta} \tilde{\mu}_{a}(k, t), & \text{if } \delta < \gamma + 1 \end{cases}
\]

uniformly in \( t \geq 1 \) and \( k \in \mathbb{R} \).

**Proposition 20.** Let \( \alpha \geq 0 \), \( r \geq 0 \), \( \delta \in \mathbb{R} \), and \( \beta \in [0, 1] \). Then,

\[
e^{-|\lambda| t} \int_1^t e^{-|\lambda|(s-1)} |\lambda|^{-\beta} \frac{1}{s^\delta} \mu_{a,r}(k, s) ds \leq \text{const. } \frac{1}{t^{2-1+\beta}} \mu_{a,r}(k, t),
\]

uniformly in \( t \geq 1 \) and \( k \in \mathbb{R} \).

**Proposition 21.** Let \( \alpha \geq 0 \), \( r \geq 0 \), \( \delta > 1 \), and \( \beta \in [0, 1] \). Then,

\[
e^{-|\lambda| t} \int_1^t e^{-|\lambda|(s-1)} |\lambda|^{-\beta} \frac{1}{s^\delta} \mu_{a,r}(k, s) ds \leq \text{const. } \frac{1}{t^{3-2+\beta}} \mu_{a,r}(k, t),
\]

uniformly in \( t \geq 1 \) and \( k \in \mathbb{R} \).

The results for the semi-group \( e^{-|k|t} \) are very similar.

**Proposition 22.** Let \( \alpha \geq 0 \), \( r \geq 0 \) and \( \delta \geq 0 \) and \( \gamma + 1 \geq \beta \geq 0 \). Then,

\[
e^{-|k|(t-1)} \int_1^t e^{-|k|(s-1)} |k|^{-\beta} \frac{(s-1)^\gamma}{s^\delta} \mu_{a,r}(k, s) ds \leq \begin{cases} \text{const. } \frac{1}{t^\gamma} \tilde{\mu}_{a}(k, t), & \text{if } \delta > \gamma + 1 \\ \log(1+t) & \text{if } \delta = \gamma + 1 \\ \frac{1}{t^\delta} \tilde{\mu}_{a}(k, t), & \text{if } \delta < \gamma + 1 \end{cases}
\]

uniformly in \( t \geq 1 \) and \( k \in \mathbb{R} \).

**Proposition 23.** Let \( \alpha \geq 0 \), \( r \geq 0 \), \( \delta \in \mathbb{R} \), and \( \beta \in [0, 1] \). Then,

\[
e^{-|k|(t-1)} \int_1^t e^{-|k|(s-1)} \frac{1}{s^\delta} \mu_{a,r}(k, s) ds \leq \text{const. } \frac{1}{t^{3-1+\beta}} \mu_{a,r}(k, t),
\]

uniformly in \( t \geq 1 \) and \( k \in \mathbb{R} \).
Proposition 24. Let $\alpha \geq 0$, $r \geq 0$, $\delta > 1$, $\beta \in [0, 1]$. Then,

$$e^{|k(t-1)|} \int_t^\infty e^{-|k(s-1)|} |k|^{\beta} \frac{1}{s^\delta} \mu_{\alpha,r}(k, s) \, ds \leq \text{const.} \frac{1}{s^{\delta-1+\beta}} \mu_{\alpha,r}(k, t),$$

$$\left| \frac{|k|}{ik} (e^{|k(t-1)|} - e^{-|k(t-1)|}) \right| \int_t^\infty e^{-|k(s-1)|} |k|^{\beta} \frac{1}{s^\delta} \mu_{\alpha,r}(k, s) \, ds \leq \text{const.} \frac{1}{s^{\delta-1+\beta}} \mu_{\alpha,r}(k, t),$$

uniformly in $t \geq 1$ and $k \in \mathbb{R}$.
