**DIPCADI KRISHNADEVARAYAE (ASPARAGACEAE), A NEW PLANT SPECIES FROM ANDHRA PRADESH, INDIA**

Boyina Ravi Prasad Rao, Kothareddy Prasad, Dasari Veeranjaneeyulu, Mudavath Chennakesavulu Naik, Sugali Salamma & Angajala Narayanaswamy

The genus, *Dipcadi* Medik. belongs to the family Asparagaceae and is distributed in southern, eastern and northern Africa, Socotra, Madagascar, Europe, Middle East and Indian subcontinent comprising 41 species, three varieties and one hybrid (The Plant List 2013; Govaerts et al. 2016). In recent works, *Dipcadi* with the type *Dipcadi serotinum* (L.) Medik. is treated under the tribe Ornithogaleae, subfamily Scilloideae and family Asparagaceae (Stevens 2001 onwards; APG IV 2016). Alternatively, it is also considered under a monophyletic subfamily Ornithogalideae under the family Hyacinthaceae (Manning et al. 2009; Martinez-Azorin 2011). Deb & Dasgupta (1981) reported nine species and three varieties of *Dipcadi* from India. Karthikeyan et al. (1989) recorded nine species and two varieties from India. Later, one new species: *D. goaense* (Prabhugaonkar et al. 2010) was added to the Indian list making the total to 10 species; of which except *D. serotinum* (L.) Medik., *D. erythraeum* Webb & Berthel, all others are endemic to India. *Dipcadi* is distributed in India from the Himalaya to peninsular India. While working on the flora of Sri Krishnadevaraya University Campus, Anantapuramu, Andhra Pradesh, India, during 2010–2015, we could locate interesting specimens of *Dipcadi*. After a critical examination of these specimens and other collections from two different localities in Anantapuramu District it is revealed that combination of characters of scape length (c. 85cm), raceme length stigma nature (distinctly 6-lobed) and number of seeds in each locule.

The novel species is distinct from all other species of *Dipcadi* in having distinctly 6-lobed stigma and shows close affinity to *D. goaense* (Prabhugaonkar et al. 2010) was added to the Indian list making the total to 10 species; of which except *D. serotinum* (L.) Medik., *D. erythraeum* Webb & Berthel, all others are endemic to India. *Dipcadi* is distributed in India from the Himalaya to peninsular India. While working on the flora of Sri Krishnadevaraya University Campus, Anantapuramu, Andhra Pradesh, India, during 2010–2015, we could locate interesting specimens of *Dipcadi*. After a critical examination of these specimens and other collections from two different localities in Anantapuramu District it is revealed that combination of characters of scape length (c. 85cm), raceme length stigma nature (distinctly 6-lobed) and number of seeds in each locule.

**Abstract:** *Dipcadi krishnadevarayae* B.R.P.Rao (Asparagaceae), a new species from the Sri Krishnadevaraya University campus, Anantapuramu of Andhra Pradesh, India, is described and illustrated. The novel species is distinct from all other species of *Dipcadi* in having distinctly 6-lobed stigma and shows close affinity to *D. goaense* (Prabhugaonkar et al. 2010) was added to the Indian list making the total to 10 species; of which except *D. serotinum* (L.) Medik., *D. erythraeum* Webb & Berthel, all others are endemic to India. *Dipcadi* is distributed in India from the Himalaya to peninsular India. While working on the flora of Sri Krishnadevaraya University Campus, Anantapuramu, Andhra Pradesh, India, during 2010–2015, we could locate interesting specimens of *Dipcadi*. After a critical examination of these specimens and other collections from two different localities in Anantapuramu District it is revealed that combination of characters of scape length (c. 85cm), raceme length stigma nature (distinctly 6-lobed) and number of seeds in each locule.

per locule (5–10) were not found in any other known species of Dipcadi and hence warrants new species status. Among the Indian species, this new species is allied to D. serotinum (L.) Medik. and D. montanum (Dalzell) Baker, but differ in the characters as given in Table 1.

### Taxonomic treatment

**Dipcadi krishnadevarayae** B.R.P.Rao sp. nov.

**Specimen examined**

*Type: 47481 (Holotype: SKU; Isotype: will be deposited in CAL), Sri Krishnadevaraya University Campus, Anantapuramu District, Andhra Pradesh, India, 14°36′44.2″N & 77°38′42.5″E, 370m, 25.viii.2012, coll. B.R.P. Rao & M. Chennakesavulu Naik (Images 1–5).*

**Paratypes: 41639 (SKU), India, Andhra Pradesh: Anantapuramu District, Sri Krishnadevaraya University campus, 14°36′44.2″N & 77°38′42.5″E, 370m, 25.viii.2012, coll. B.R.P. Rao & M. Chennakesavulu Naik; 45317 (SKU), Tadimarri, 14°33′45.41″N & 77°52′15.51″E, 376m, 30.viii.2012, coll. B.R.P. Rao, A. Narayanaswamy & D. Veeranjaneyulu; 3km from Garladinne Village on Penakacharla Road, 51138 & 51275 (SKU), 14°49′00.29″N & 77°34′18.13″E, 347–367 m, 6.vii.2016, coll. S. Salamma & A. Sreenath (Image 5).*

**Diagnosis**

The novel species is distinct from all other species of Dipcadi in having a distinctly 6-lobed stigma and allied to *D. serotinum* and *D. montanum*. It differs from both the latter species in having a combination of up to 50cm long linear leaves, 85cm long 16–24 flowered scapes, greenish-yellow flowers, a dark green band outside the outer tepals, a distinctly 6-lobed stigma and up to 10 seeds in each locule.

Perennial, bulbous, scapigerous herbs. Plants erect, c. 85cm high (including scape). Bulbs ovoid or globose, 4–4.5 × 2–3.5 cm, white, glabrous, with many unbranched fibrous roots from base; outer tunics of bulb membranous, scarious; inner layers fleshy. Leaves all basal, 2–4 per bulb with sheathing base, emerge along with scape, linear, clavate, 16–20-veined, green, 25–50 × 0.4–1.2 cm, acute at apex, entire at margins; sheaths broader and white, glabrous; leaves fleshy when fresh and become membranous in herbarium specimens. Inflorescence racemose, secund with patent flowers. Scapes erect, slender, 30–85 cm long, cylindrical and glossy in fresh specimens; pedicels 4–5 mm long, c. 1mm thick, stout. Bract 1, longer than the pedicel, membranous, scarious, ovate, 6–12 × 2–6 mm, acuminate-caudate at apex, base with hyaline entire margins and 5–10 conspicuous nerves, persistent; bracteoles absent. Perianth in two whorls, 3+3, spreading, subequal, obscurely veined. Outer tepals, 8–13 mm long, longer than the inner ones; tube united one to two thirds, campanulate, 3–7 mm long; lobes narrowly oblong or oblong-obovate, 5–6 × 2–4 mm, acute and tubercled at apex, hooded or curved outwards to almost half of the length. Inner tepals connivent; tube more than two-thirds, c. 11mm long; lobes deltoid, 3–3.2 × 2–2.5 mm, acute and tubercled at apex and reflexed. Stamens 6, inserted at throat of tube; filaments adherent along perianth throughout tube protruding at tip; anthers 2.5–3 × 1–1.2 mm, linear-oblong, versatile, dorsifixed, introrse, dehiscing longitudinally; pollen oblong; stipe c. 1mm long. Ovary
superior, sessile, oblong-obovate, 4–5 × 1.5–2 mm; style cylindric, 4–5 mm long; stigma simple in young flowers, 3-lobed at maturity and each lobe further bilobed. Capsules trigonous, deeply 3-lobed, quadrate in outline, deeply sulcate, subglobose to obovoid, 1–1.2 × 1 cm, narrowed at base, as broad as long, truncate

at apex, stipitate, loculicidally dehiscent; pericarp thin, brittle; dry perianth reflexed. Seeds 5–10 in each locule, uniseriate, horizontally stacked, compressed or polygonal, subdiscoid, rarely ellipsoid, 3–5 × 2–5 mm, with shallow depressions, margins thickened, brownish-black, glossy.
**Dipcadi krishnadevarayae** sp. nov.

Table 1. Comparison of the morphological characters of *Dipcadi krishnadevarayae*, *D. serotinum* and *D. montanum*

| Characters | *D. krishnadevarayae* | *D. serotinum* | *D. montanum* |
|------------|----------------------|----------------|---------------|
| Bulbs      | 4–4.5 × 2–3.5 cm     | 2–3.5 × 1.5–3 cm | 1.2–2.0 × 1–1.5 cm |
| Leaves per bulb | 3–4               | 2–4           | 3–8          |
| Scape      | 30–85 cm long       | 20–70 cm long  | 18–25 cm long |
| Raceme     | 20–40 cm long       | 10–16 cm long  | 5–15 cm long  |
| Tepals colour | Greenish-yellow   | White-pale pink | Greenish-white |
| Bracts     | 6–12 × 2–6 mm       | 8–12 × 4–5 mm  | 5–10 × 3–4 mm |
| Ovary      | sessile or sub sessile | Sessile-stipitate | stipitate |
| Stigma     | distinctly 6-lobed  | 3-lobed        | 3-lobed      |
| Capsules   | as long as broad    | as long as broad | broader than the long. |
| Seeds per locule | 5–10             | 6–8           | 3–5          |

**Phenology**

June–August. Remains dormant with the underground bulb.

**Ecology**

This species is found in lateritic gravelly soils in open places among grass at an elevation range of 300–400 m. Common associates are *Heteropogon contortus* (L.) P. Beauv. ex Roem. & Schult., *Chrysopogon fulvus* (Spreng.) Choiv. *Cleome viscosa* L. and *Kohautia aspera* (B. Heyne ex Roth) Bremek.

**Distribution**

Presently known only from three localities in Anantapuram District, India: the type locality, Sri Krishnadevaraya University campus, Anantapuram, Andhra Pradesh; edges of cultivated fields, 3 km from Garladinne Village towards Penakacharla and Tadimarri Village, located 22 and 45 km from Anantapuram Town.

**Etymology**

This new species is named after Sri Krishnadevaraya, Emperor of Vijayanagara Dynasty (collection sites and the type locality falls in this region) who was known for his significant contribution in conserving natural resources 400 years ago.

**Conservation status**

About 500 plants were found in the type locality. About 50 plants were seen at the edges of the cultivated fields, 3 km from Garladinne Village and 50 plants near Tadimarri Village. Since an assumption that the species might be distributed elsewhere in Anantapur District and its surroundings in allied habitats, and more explorations are required to determine its full range of distribution as well as population, the species is categorized as Data Deficient.

**Notes**

Perusal of literature revealed that of all the species of *Dipcadi*, only *D. glaucum* have indistinctly 6-lobed stigmatic apex (Obermeyer 1964), and all other species have either unlobed, distinctly or indistinctly 3-lobed stigmatic apex. It is interesting to note that Robert Wight’s collection of *Dipcadi serotinum* from Peninsular India have 14 seeds per locule (Deb & Desgupta 1976).
