Supplemental Figure 2: Dyed plasma behavior. (A) Representative photograph from cells in dyed plasma. (B) After two hours at rest, the stained suspensions (with Atto647 (Atto) and Fluoresceine (Fluo)) presents a sedimentation rate with no significant difference from the control, unstained sample. All suspensions have a controlled hematocrit of 45%. (C) Shows usual range of sedimentation height along time for healthy samples, comprising the control measurements with the dyes.
