Supplementary Figure 1. Cumulative incidence of clinical outcomes (liver decompensation, liver-related events and death) for compensated advanced chronic liver disease patients without high-risk varices. Liver decompensation was defined as the presence of ascites, variceal bleeding and hepatic encephalopathy. Liver-related events was defined as the presence of liver decompensation, hepatocellular carcinoma or death. CSPH, clinically significant portal hypertension; sHR, subdistribution hazard ratio; CI, confidence interval; NA, not applicable.
