Table 1: Cytokine levels, demographic and laboratory characteristics in patients with severe and mild/moderate cases with CCHF.

| Features                  | Severe cases | Mild/moderate cases | n | P value |
|---------------------------|--------------|---------------------|---|---------|
| Age                       | 50.6 ± 20.3  | 49.8 ± 21.0         | 22 | 0.682   |
| Female gender, 31 (67.4)  | 63 (58.3)    | 0.291               |    |         |
| n (%)                     | 31            |                     |    |         |
| TNF                       | 68.2 ± 23.5  | 41.3 ± 17.4         | 2  | 0.008   |
| IL-6                      | 73.1 ± 41.6  | 38.0 ± 19.5         | 2  | 0.003   |
| IL-10                     | 6.2 ± 1.3    | 6.2 ± 1.4           | 2  | 0.753   |
| IFN-gamma                 | 145 ± 96     | 126 ± 92            | 2  | 0.664   |
| WBC                       | 3286 ± 5000  | 2275 ± 1286         | 2  | 0.280   |
| PLT                       | 53564 ± 36520| 98065 ± 42768       | 2  | 0.001   |
| CRP                       | 3.2 ± 2.6    | 1.1 ± 1.4           | 2  | 0.005   |
| ALT                       | 521 ± 482    | 208 ± 320           | 2  | 0.044   |
| AST                       | 869 ± 1182   | 256 ± 215           | 2  | 0.016   |
| C reactive                 | 1138 ± 970   | 676 ± 835           | 2  | 0.007   |
| LDH                       | 1800 ± 1254  | 589 ± 271           | 2  | 0.002   |

Conclusion. Cytokines, chemokines, and other inflammatory mediators function in a manner, acting on many different cell types to regulate the host's immune response. When cytokines present in high concentrations, they might toxic or even lethal effects. In accordance with this view, we have detected increased serum TNF-alpha, IL-6 levels in the patients with serious CHF.

1034. Etiologic Involvement of Enterovirus and Human Bocavirus in Acute Flaccid Paralysis Cases in India

Manjari Baluni, Ph.D.(Pursuing); Dharamveer Singh, Ph.D.(Pursuing); Sneha Ghunthyal, PhD(Pursuing); Tanzeem Fatima, Ph.D.(Pursuing); Amreen Zia, Ph.D.(Pursuing) and Tapan Pahol, M.D.,1 Sanjay Gandhi Post Graduate Institute of Medical Sciences, Lucknow, India, 2Sanjay Gandhi Postgraduate Institute of Medical Sciences, Lucknow, India,3Microbiology, Sanjay Gandhi Post Graduate Institute of Medical Sciences, Lucknow, India

Session: 139. Adult Viral Infection

Friday, October 6, 2017: 12:30 PM

Background. Acute flaccid paralysis (AFP), characterized by the rapid onset of asymmetric paralysis, can be caused by a variety of viral infections or infections. Besides wild-type and revertant vaccine strains of polioviruses, several nonpolio enteroviruses, have also been associated with AFP. Enteroviruses (EVs) are RNA viruses in the family Picornaviridae comprising more than 100 serotypes that are divided into four species, human enteroviruses A to D. The clinical manifestations of EVs range from conjunctivitis, respiratory tract infections, myocarditis, menin-gitis, encephalitis, and neonatal sepsis, like illness. Human Bocavirus (HBoV), a newly classified member of the Parvoviridae family, has been detected frequently in feces of diarrheic children suggesting its possible etiological involvement in the disease.

Methods. Total 586 stool specimens were collected in 2016 from children sus-pected for AFP. Molecular method for targeting 5' untranslated region (UTR) and VP1 capsid region was used for detection of human enteroviruses (HEV), human bocavirus (HBoV) and saffold viruses in direct clinical specimen.

Results. EV RNA was detected in 103 (17.6%) of 586 stool specimens by real-time RT-PCR targeting the highly conserved 5' UTR region. Out of them, 71 (12.11%) were NPEV, partially sequenced by VP1 which revealed the sequence of echovirus (ECV) 19 (n = 6), ECV 11 (n = 7), ECV 18 (n = 4), ECV 33 (n = 5), ECV 29 (n = 1), ECV 25 (n = 2), ECV 24 (n = 3), ECV 3 (n = 3), ECV 14 (n = 2), ECV 13 (n = 1), ECV 2 (n = 1), ECV 4 (n = 1), ECV 17 (n = 1), ECV 22 (n = 1), ECV 27 (n = 2), ECV 6 (n = 2), CV A10 (n = 2), CV A9 (n = 1), CV A6 (n = 2), CV B4 (n = 1), CV B5 (n = 3), CV B6 (n = 3), EV 80 (n = 1), EV 83 (n = 1), EV 97 (n = 2).

Total 63 (10.75%) HBoVs were detected by real-time PCR which were further sequenced by VP1. The sequence of HBoV-1 (n = 8), HBoV-2 (n = 15), HBoV-3 (n = 9) and HBoV-4 (n = 5). Out of them 9 (1.5%) were detected as co infection with NPEVs. Phylogenetic analysis showed 0.9 - 5.6% divergence at nucleotide level among HBoVs. Total 9 (1.5%) saffold viruses was detected and characterized by VP1 sequencing. Co-infection of EV and HBoVs were found the main etiologic agent in children sus-pected with AFP. Molecular typing of these viruses is useful for characterizing emerging serotypes and their epidemiological investigation.

1035. Frequency of Epstein–Barr Virus Genotypes in Pakistani Trangender SexWorkers

Sadia Salahuddin, Main, Biological Sciences, Gomal University, Dera Ismail Khan, Pakistan

Session: 139. Adult Viral Infection

Friday, October 6, 2017: 12:30 PM

Background. Transgender community large association with sex work has put them at a greater risk of contracting sexually transmitted infections (STIs). The aim of this study was to investigate the prevalence of Epstein-Barr Virus (EBV) genotypes in transgender sex workers (TSWs) of twin-cities of Pakistan. The high prevalence of EBV-2 genotype in sex workers has been previously reported. EBV genotypes were investigated in transgender sex workers to find out EBV-2 occurrence in Pakistani population.

Methods. A total of 86 transgender (Hijras) sex workers were randomly included in this study. Demographics, including age, the number of sex partners, sexual habits, and awareness about protective methods were obtained. Blood was collected from all subjects and the presence of Human Immunodeficiency Virus, Hepatitis B and C virus were detected by antibody strip testing. EBV detection and genotyping were performed by extracting genomic DNA from all available blood samples. β-globin and EBNA-1 were amplified to assess the quality and presence of EBV DNA. Analysis of EBNA-2 genotyping was done by nested PCR.

Results. The most prevalent infection in 40 transgender sex workers (46.51%) followed by HCV in 15 (17.44%). Among HIV-seropositive TSWs, EBV gen-otye determination was only achievable in 60% of cases, where 62.5% were EBV-1, 29.16% of EBV-2 and co-infection was found in 8% samples. Among HIV-negative individuals, 78% were EBV-1, whereas EBV-2 genotype and co-infections were absent. All non-typable samples were amplifiable for the EBNA-1 gene in both populations, confirming EBV genome in the samples.

Conclusion. EBV-1 was the most common genotype of EBV in HIV seropositive and seronegative TSWs but the high occurrence of EBV-2 and co-infection of both types was observed only in HIV seropositive individuals. This is the first report of frequency of EBV infections in the HIV-positive transgender community of Pakistan.

1036. Risk Factors for Herpes Zoster: A Systematic Review and Meta-Analysis

Konsole Kawan, ScD7 and Barbara P. Yawn, MD, MSc, MSHP, FAAP7,1 Boston Children's Hospital and Harvard Medical School, Boston, Massachusetts, 2Department of Research, Olmsted Medical Center, Rochester, Minnesota; 3University of Minnesota, Minneapolis, Minnesota

Session: 139. Adult Viral Infection

Friday, October 6, 2017: 12:30 PM

Background. Well-recognized risk factors for herpes zoster (HZ), commonly known as shingles, are age and immunosuppression. Numerous studies have investi-gated other various risk factors for HZ in recent years. The objective of our study is to systematically review studies examining risk factors for HZ and discuss implications based on the updated evidence.

Methods. We performed a literature search using PubMed, Embase, and Web of Science and included studies that examined risk factors for HZ. Random effects model was used to summarize the risk ratio (RR) or odds ratio (OR) and 95% confidence interval (CI).

Results. Of the 3450 studies screened, we included 84 studies in the systematic review and conducted meta-analysis in 62 studies. Women are at increased risk of HZ compared with men (pooled adjusted RR = 1.31; 95% CI 1.27, 1.34). Black individ-uals have almost half the risk of HZ than White individuals (pooled RR = 0.54; 95% CI: 0.47, 0.63). Family history was found to be a risk factor for HZ (pooled OR = 3.39; 95% CI: 2.39, 5.40). Autoimmune diseases, including rheumatoid arthritis (pooled RR = 1.67; 95% CI 1.41, 1.98) and systemic lupus erythematosus (RR = 2.10; 95% CI: 1.40, 3.15), were associated with an elevated risk of HZ. Other comorbidities were associated with an increased risk of HZ, with the pooled ORs ranging from 1.25 (95% CI: 1.13, 1.39) for asthma to 1.30 (1.17, 1.45) for diabetes mellitus, and 1.31 (95% CI: 1.22, 1.41) for chronic obstructive pulmonary disease. Statin use was also
