DIVERSITY AND CONSERVATION STATUS OF FLORA IN PILAVAKKAL DAM FOOTHILLS OF WESTERN GHATS, TAMIL NADU, INDIA. The floristic study is necessary to understand the present diversity status and conservation of forest biodiversity. It has been realized that the study of local or regional flora is of much more significance than those covering big areas because explorations can be carried out intensively in small areas with damaging consequences. Understanding species diversity and distribution patterns are important to evaluate the complexity and resources of these forests. In the present study, the medicinal floristic diversity of Pilavakkal dam Foothills of the Western Ghats comprised of 127 species belonging to 42 families and 100 genera. Fabaceae, Malvaceae and Lamiaceae were dominant families with 23, 11 and 10 species, respectively. The total number of species includes 55 herbs, 23 shrubs, 37 trees and 12 climbers. Totally 127 important medicinal plant species are recorded in Pilavakkal dam Foot Slopes of Western Ghats. Psydrax dicoccos is vulnerable in this list, 27 plants species are Least Concern and Mangifera indica comes under the Data Deficient and 98 plants species evaluated are not categorized by IUCN. This study provides basic information about the medicinal flora and conservation status of the Pilavakkal dam Foothills of Western Ghats. It would also be helpful for the identification of flora and to derive conservation policies and make sustainable use of plant resources.

Keywords: Western Ghats, Fabaceae, Malvaceae, IUCN, Vulnerable, Psydrax dicoccos

KERAGAMAN DAN STATUS KONSERVASI TUMBUHAN OBAT DI KAKI BUKIT BENDUNGAN PILAVAKKAL, GHATS BAGIAN BARAT, TAMIL NADU, INDIA. Studi floristik diperlukan untuk memahami keanekaragaman dan konservasi keanekaragaman hayati hutan. Telah disadari bahwa studi tentang flora lokal atau regional jauh lebih penting daripada studi di wilayah yang luas karena eksplorasi dapat dilakukan secara intensif di wilayah kecil. Memahami keanekaragaman spesies dan pola distribusi penting untuk mengukur kompleksitas dan sumber daya hutan ini. Dalam penelitian ini, keanekaragaman tumbuhan obat pada kaki induk bendungan Pilavakkal Ghats Barat terdiri dari 127 spesies yang termasuk dalam 42 famili dan 100 marga. Fabaceae, Malvaceae dan Lamiaceae merupakan famili yang dominan dengan 23 jenis, 11 jenis dan 10 jenis. Jumlah spesies meliputi 55 herba, 23 semak, 37 pohon dan 12 pemanjat. Seluruh 127 spesies tanaman obat penting dicatat di Bendungan Pilavakkal, Lereng Kaki Ghats Barat. Dalam daftar ini Psydrax dicoccos statusnya rentan, 27 spesies statusnya Kurang mendapat perhatian dan Mangifera indica statusnya Data Deficient dan 98 spesies tumbuhan lainnya belum dirumuskan oleh IUCN. Studi ini memberikan informasi mendasar tentang flora obat dan status konservasinya di Kaki Lereng Bendungan Pilavakkal Ghats Barat. Data ini akan membantu identifikasi flora dan menjadipertimbangan kebijakan konservasi dan pemanfaatan yang berkelanjutan.

Kata kunci: Ghats Barat, Fabaceae, Malvaceae, IUCN, Rentan, Psydrax dicoccos

I. INTRODUCTION

The forests of the Western Ghats of India are best representatives of non-equatorial tropical evergreen forests of the world (Pascal, 1988; Pascal, 1991). The Western Ghats cover only 5% of the country's total land area but contain more than 5,000 or 27% of the country's total plant species. The Western Ghats is one of the richest centers of endemism in India and nearly 63% of India's arborescent evergreen taxa are endemic to this region (Ramesh & Pascal, 1991). The number of endemic plant species in the Western Ghats is estimated to be about 1,500 (MacKinnon and MacKinnon, 1986). The higher levels of biodiversity and endemism have earned the area to be recognized as one among the biodiversity hotspots of the world (Myers, 1988). The floristic diversity of the Western Ghats is very significant as this hill range accommodates different vegetation types such as wet evergreen forests, moist and dry deciduous forests, montane forests, sholas, scrubs and savannas.

India is endowed with rich and diverse forest resources (Nayar & Sastry, 1987) of the more than 250,000 higher plant species on earth, more than 80,000 are medicinal. India is one of the world 12 biodiversity centres with the presence of over 45,000 different plant species. India’s diversity is unmatched due to 16 different agroclimatic zones, 10 vegetation zones, 25 biotic provinces and 426 biomes. About 15,000-20,000 plants have good medicinal value (Joy, Thomas, Mathew & Skaria, 2001). Biodiversity includes diversity within species and between species, and ecosystems (Chaudhary, 1998). It is not evenly distributed everywhere, rather it varies greatly across the globe as well as within different geographical regions. The Convention of Biological Diversity defines documentation of biodiversity as one of the most prioritized tasks by the world. Biodiversity documentation is possible through extensive botanical exploration and floristic studies (Chalise et al., 2018). The floristic study refers to documentation of all plants species in a given geographical region (Simpson, 2006). Such studies help in botanical enumeration, update nomenclature changes, add herbarium specimens in the existing herbaria and compare close or distantly related plants (Chalise et al., 2018). The results of such floristic studies mostly come in the form of floras (Palmer, Wade & Neal, 1995) which may be local, regional, country-wise and so on, or they may be in the form of checklists (Chalise et al., 2018). Floristic wealth is an indispensable part of the natural balance that interprets the effects of the total environment (Billings, 1952). Floristic composition fluctuates from one season to another season in recurring conduct over the years in a succession way. The decline of plant species changes the pattern of the species distribution in the community (Watt, 1964; Heady, 1958).

Medicinal plants which form the backbone of traditional medicine have in the last few decades been the subject of very intense pharmacological studies. This has been brought about by the acknowledgement of the value of medicinal plant as potential source of new compounds of therapeutic value and as source of new compounds in drug development. In many parts of the world medicinal plants are used for antibacterial, antifungal and antiviral activities. A plant derived drugs serve as a prototype to develop more effective and less toxic medicinal products (Manikandan et al., 2019; ). Plants have been an important source of medicine for thousands of years. Use of plants for the treatment of many diseases dated back to prehistory and people of all continents have this old tradition (Manikandan et al., 2020). The traditional methods, especially the usage of medicinal plants, still play a vital role to cover the basic health needs in the developing countries and moreover, the use of herbal remedies has risen in the developed countries in the last decade. Plants have provided a source of inspiration of novel drug compounds, as plant derived medicines have made large contributions to human health and well-being. Their role is twofold namely; they provide key chemical structure for the development of new antimicrobial drugs and also as a phytomedicine
to be used for the treatment of diseases (Manikandan & Ramasubbu, 2020). Plants used for the traditional medicine contains a wide range of substance used to treat chronic as well as infectious diseases. A vast knowledge of the plants used against different illnesses may expected to have accumulated in areas where the use of plants is still of great importance (Manikandan et al., 2017). The present study was carried out to survey and document the Assessment of Medicinal Floristic Diversity and conservation status of Pilavakkal dam foothills of Western Ghats, Tamil Nadu, India.

II. STUDY AREA AND METHOD

The present study was conducted in Srivilliputhur Pilavakkal Dam foothills of Western Ghats, Virudhunagar District, Tamil Nadu, India. The study area of Pilavakkal Dam lies between 9°64’03”N latitude and 77°52’52”E longitude, it is situated at around 90 km from Madurai and 45 km from Virudunagar. The dam comprises 2 divisions namely the Kovilar and Periyar Dam. The limit of the Periyar dam is 192 million cubic feet (mcft) and the Kovilar Dam is 133 mcft. From October to December, the dam will be loaded with water. The study area of Pilavakkal Dam foothills of Western Ghats is covered by scrub and dry deciduous forest and it has rich and different kinds of medicinal plant diversity (Figure 1 & 2).

Field trips were conducted frequently during summer, winter and in rainy seasons of 2019-2020. All the plant species were collected in the months of the flowering season. Field data were noted in the field diary. Collected plants were identified by referring to Flora of Presidency of Madras (Gamble, 1935; Gamble & Fischer, 1937) Flora of Tamil Nadu Carnatic (Matthew, 1981; Matthew, 1982) and matching with authentic specimens. We collected information about the uses of medicinal plants through the literature and local people. Photographs were taken and herbaria were prepared, which later were deposited at the Department of Botany, Sri Kaliswari College (Autonomous), Sivakasi.

Figure 1. Map of the Study area (Pilavakkal Dam)
III. RESULT AND DISCUSSION

In the present study, the medicinal floristic diversity of Pilavakkal dam Foothills of the Western Ghats comprised of 127 species belonging to 42 families and 100 genera (Table 1; Figure 4). The total number of species includes 55 herbs, 23 shrubs, 37 trees and 12 climbers. Fabaceae, Malvaceae and Lamiaceae were dominant families with 23, 11 and 10 species, respectively (Figure 3). In this list *Psydrax dicoccos* is Vulnerable and this species is rare in this study area, 27 plants species are Least Concern, *Mangifera indica* is categorized as Data Deficient, and 98 plant species are not evaluated by the International Union for Conservation of Nature (IUCN). There is no effort of the local people to conserve the medicinal plants and there is no local wisdom regarding the sustainable use of these valuable resources.

Plant resources are presented with materials for survival, which has economic, medicinal, or forage values (Morgan, 1981). Many medicinal and economic important tree species are considered as Rare Endangered Threatened (RET) species owing to rapid agricultural and urban development, deforestation and indiscriminate collection (Manikandan et al., 2017). As a plant species is lost from a region, the information enclosed in it will also be slowly distorted and finally become lost forever. The documentation of indigenous knowledge and conservation of a plant species, both are basic burning issues (Cunningham, 1996). The floristic study is necessary to understand the present diversity status and conservation of forest biodiversity. It has been realized that the study of local or regional flora is of much more significance than those covering big areas because explorations can be carried out intensively in small areas with damaging effect. Understanding species diversity and distribution patterns are important to evaluate the complexity and resources of these forests. Floristic studies include species lists, life form spectra, geographical distribution, and identification of threatened species that are useful for evaluating ecological issues such as biodiversity, growth capacity, conservation and regulation (Ali et al., 2018). Documenting the distribution of biodiversity is the first and most fundamental step for effective conservation and sustainable utilisation of natural resources for the future (Gaston, 2000).

Plants have been an important source of medicine for thousands of years
Packiyalakshmi et al., 2017; Manikandan et al., 2020). India is a veritable emporium of medicinal and aromatic plants. It has been estimated that out of 15,000 higher plants occurring in India, 9,000 are commonly useful, of which 7,500 are medicinal, 3,900 are edible, 700 are culturally important, 525 are used for fibre, 400 are fodder, 300 for pesticide and insecticide, 300 for gum, resin and dye and 100 for incense and perfume (Anonymous, 1994). In the present study 127 medicinally important plant species were distributed in the Pilavakkal Dam Foothills of the Western Ghats and their uses are described in Table 1. These are taken internally, or applied externally in infusion, decoction, paste or powder. Most of the plants used in medicine are either mixed with other ingredients or used singly.

One hundred twenty-seven plant species were found in the area with medicinal properties. These are depleting rapidly because of unsustainable harvesting, lack of awareness, and unrestricted grazing by domestic animals from nearby villages. Nonetheless, many people from far and wide come to this area to collect medicinal plants and share their knowledge on the medicinal uses of these plants. So, proper conservation and establishment plans are needed to conserve the medicinal plant resources of this area. It would be helpful for the identification of flora and to derive conservation policies and make sustainable use of plant resources.

IV. CONCLUSION

This study provides basic information about the medicinal flora of the Pilavakkal Dam Foothills of Western Ghats, which comprised of 127 species with medicinal properties, belonging to 42 families and 100 genera. *Psydrax dicrocos* is Vulnerable in this list, 27 plants species are under the Least Concern and *Mangifera indica* comes under the Data Deficient, and 98 plants species are Not Evaluated by IUCN. These medicinal plants are depleting rapidly because of unsustainable harvesting, lack of awareness, and unrestricted grazing by domestic animals from nearby villages. So, proper conservation and establishment plans are needed to protect the medicinal plant resources of this area.

| 80  | *Corchorus capsularis* L.               | Herb  | NE                | The roots are used to treat headache, as a demulcent, to cure coughs and as a vermifuge (Dutta et al., 2016)                                                                                                      |
| 81  | *Corchorus tridens* L.                  | Herb  | NE                | It is indicated for general bacteria, bronchitis, colitis, cold, cough, fatigue, immune depression, and non-specific infections (Choudhary et al., 2016)                                                           |
| 82  | *Hibiscus vitifolius* L.                | Shrub | NE                | The leaf contains substances that have possible antimicrobial activity (Basha et al., 2011)                                                                                                                       |
| 83  | *Pavonia procumbens* (Wright &Arn.) Walp.| Shrub | NE                | The leaf extracts having high antioxidant potential (Ignacimuthu et al., 2008)                                                                                                                                |
| 84  | *Pavonia zeylanica* (L.) Cav.           | Shrub | NE                | It is used to treat viral warts and chronic disease of the nervous system (Ignacimuthu et al., 2008)                                                                                                          |
| 85  | *Sida acuta* Burm.f.                    | Herb  | NE                | The plant is taken as an emmenagogue and oxytocic and the root is considered antibilious (Datta et al., 2014)                                                                                                   |
| 86  | *Sida cordata* (Burm.f.) Borss. Waalk.  | Herb  | NE                | It is used for gargles and tooth powders (Ignacimuthu et al., 2008)                                                                                                                                           |
| 87  | *Sida cordifolia* L.                    | Herb  | NE                | The whole plant is used as an anthelmintic, antiseptic, antivenin. (Savithramma et al., 2007)                                                                                                                 |
| 88  | *Sida rhombifolia* L.                   | Herb  | NE                | It is also used by mothers after childbirth to bring relief to painful wombs and to treat colic (Bhandary et al., 1995)                                                                                           |
| 89  | *Sterculia foetida* L.                  | Tree  | NE                | The fruits have diuretic, laxative and purgative activities and also show molluscicidal and antimicrobial properties. (Putri & Bashri, 2019)                                                             |
| 90  | *Azadirachta indica* A. Juss            | Tree  | LC                | It is used for antiseptic, head ache, earache and ophthalmia (Ayyanar & Ignacimuthu, 2011)                                                                                                                  |
| 91  | *Cyclea peltata* (L.am) Hook. f. &Thoms.| Climber | NE      | The seed oil is given as a stomachic and cholagogue (medicinal agent which promotes the discharge of bile from the system, purging it downward) in the treatment of dyspepsia and cases of sluggish liver (Begum & Nath, 2000) |
| No. | Name of the Species | Habit | IUCN Status 2021-1 | Medicinal uses |
|-----|---------------------|-------|---------------------|----------------|
| 92. | *Mollugo verticillata* L. | Herb | NE | It is used to treat diarrhoea and cure ulcer (Core, 1967) |
| 93. | *Trigastrotheca pentaphylla* (L.) Thulin | Herb | NE | The leaves have been shown to have antibacterial, antibiotic, antispasmodic and astringent (Balkrishna et al., 2018) |
| 94. | *Ficus benghalensis* L. | Tree | NE | The bark extracts applied on fracture and used in fever (Ayyanar & Ignacimuthu, 2011) |
| 95. | *Ficus hispida* L. f. | Tree | LC | It is so effective that it is regularly used to clear the digestive tract in cases of poisoning (Bhargava, 1983) |
| 96. | *Syzygium camini* (L.) Skeels | Tree | LC | It is used to cure eye sore, renal infection, cough (Dahare & Aruna et al., 2010) |
| 97. | *Boerhavia diffusa* L. | Herb | NE | It has been used as a diuretic, anti-diabetic (Aeri et al., 2014) |
| 98. | *Boerhavia erecta* L. | Herb | NE | The plant decoction is used for treatment of skin problems such as dermatitis, eczema and pruritus (Rao et al., 2006) |
| 99. | *Passiflora foetida* L. | Climber | NE | The plant is strongly astringent, encouraging clotting of the blood (Ajesh et al., 2012) |
| 100. | *Pedalium murex* L. | Herb | NE | The seeds are used to cure eye diseases, gonorrhoea and gout (Balakrishnan et al., 2009) |
| 101. | *Flueggea leucopyrus* Willd. | Shrub | NE | All plant parts are said to have tonic, diuretic, stomachic and febrifuge properties (Jagtap et al., 2009) |
| 102. | *Meineckia parvifolia* (Wight) G. L. Webster | Shrub | NE | A decoction of the whole plant is used as a treatment for fevers (Sreeja et al., 2016) |
| 103. | *Phyllanthus amarus* Schumach. &Thonn. | Herb | NE | The juice of the leaves is used to treat cuts and wounds (Ignacimuthu et al., 2008) |
| 104. | *Phyllanthus emblica* L. | Tree | NE | The plant is antipruritic, aphrodisiac, astringent, diuretic, emollient, febrifuge and tonic (Savithramma et al., 2007) |
| 105. | *Phyllanthus maderaspatensis* L. | Herb | NE | The juice of the leaves is mixed with vinegar to make an anti-inflammatory and digestive remedy (Meyanungsang et al., 2015) |
| No. | Name of the Species | Habit | IUCN Status 2021-1 | Medicinal uses |
|-----|---------------------|-------|-------------------|----------------|
| 106 | Cymbopogon citratus (DC.) Stapf | Herb | NE | Various parts are used in decoction, cholera, bronchitis, dysuria. Essential oil used for anti-microbial activity (Machraoui et al., 2018; Manikandan et al., 2021) |
| 107 | Cynodon dactylon (L.) Pers. | Herb | NE | It is used to treatment of headache, menstrual pain and ulcer (Ignacimuthu et al., 2008) |
| 108 | Mitracarpus hirtus (L.) DC. | Herb | NE | A tincture of the leaves is said to alleviate neuralgic pains (Rizki et al., 2019) |
| 109 | Morinda tinctoria (Roxh.) | Shrub | NE | It is used to heal stomach ailments and also used as a tonic and anti-dandruff (Ayyanar & Ignacimuthu, 2009) |
| 110 | Oldenlandia umbellata L. | Herb | NE | The sap is used to treat eczema, worms and ringworm (Savithramma et al., 2007) |
| 111 | Psidium dioica Gaertn. | Tree | VU | It is used in the treatment of gonorrhoea (Ranjithkumar et al., 2014) |
| 112 | Spermacoce hispida L. | Herb | NE | Leaves and bark extracts are used for controlling blood pressure (Shubashini & Uma, 2010) |
| 113 | Spermacoce ocymoides Burm.f. | Herb | NE | A decoction of the flower buds is used as a remedy for children’s bedwetting and urinary complaints (Ayyanar & Ignacimuthu, 2009) |
| 114 | Toddalia asiatica (L.) Lam. | Shrub | NE | The bark has been used as an astringent and in the treatment of bronchitis (Ayyanar & Ignacimuthu, 2009) |
| 115 | Cardiospermum halicacabum L. | Climber | LC | A fruit extract is used to relieve bodily pains and inflammatory problems (Shubashini & Uma, 2010) |
| 116 | Madhuca longifolia (J. Koenig. ex L.) J.F.Macbr | Tree | NE | The juice from the leaves is used traditionally to treat earache (Ayyanar & Ignacimuthu, 2009) |
| 117 | Ailanthus excels Roxb. | Tree | NE | Various parts of the tree, such as the leaves and fruit, contain tannins and are astringent (Savithramma et al., 2007) |
| 118 | Solanum melongena var. isanum (L.) | Herb | NE | It is used to boost digestive function and to treat fevers (Ignacimuthu et al., 2008) |
| No. | Name of the Species                     | Habit  | IUCN Status 2021-1 | Medicinal uses                                                                                                                                                                                                 |
|-----|----------------------------------------|--------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 119 | *Solanum pubescens* Willd.             | Shrub  | NE                 | The leaves are diuretic and are applied in the treatment of oedema, jaundice, painful discharge of urine and dropsy (Sasi & Rajendran, 2012)                                                                      |
| 120 | *Solanum virginianum* L.               | Shrub  | NE                 | The stems are used in the treatment of scabious skin diseases and psoriasis (Sadaf et al., 2014)                                                                                                              |
|     | **Typhaceae**                           |        |                    |                                                                                                                                                                                                                |
| 121 | *Typha angustifolia* L.                 | Herb   | NE                 | They are used as a treatment against bronchial catarrh, dysentery, and diarrhoca (Punnam Chander et al., 2015)                                                                                                   |
|     | **Ulmaceae**                            |        |                    |                                                                                                                                                                                                                |
| 122 | *Holoptelea integrifolia* (Roxb.) Planch. | Tree   | NE                 | The whole plant is used as a mild laxative medicine and also as stomachic, antiseptic and emmenagogue. (Raj Kumar Verma, 2014)                                                                              |
|     | **Verbenaceae**                         |        |                    |                                                                                                                                                                                                                |
| 123 | *Gmelina arborea* (Roxb.) ex Sm.       | Tree   | LC                 | The leaves have been mixed with oil and used as a poultice on sores (Murtem and Pradeep, 2016)                                                                                                             |
| 124 | *Lantana camara* L.                    | Shrub  | NE                 | The pods and foliage are a protein-rich fodder source. (Ignacimuthu et al., 2008)                                                                                                                           |
| 125 | *Priva cordifolia* (L. f.) Druce       | Herb   | NE                 | The root has been used to treat tuberculosis and is also said to cure impotence (Ignacimuthu et al., 2008)                                                                                                   |
|     | **Vitaceae**                            |        |                    |                                                                                                                                                                                                                |
| 126 | *Cissus quadrangularis* L.             | Climber| NE                 | The aromatic leaves are astringent, febrifuge, sedative, tonic and vermifuge (Reddy et al., 2016)                                                                                                             |
|     | **Zygophyllaceae**                      |        |                    |                                                                                                                                                                                                                |
| 127 | *Tribulus terrestris* L.               | Herb   | LC                 | The seeds are anthelmintic, aphrodisiac, astringent and febrifuge (Ayyanar & Ignacimuthu, 2011)                                                                                                             |
Appendix 2. Medicinal Floristic Diversity of Pilavakkal Dam Foothills of Western Ghats
Diversity and Conservation Status of Flora in Pilavakkal Dam Foothills 

Ipomoea sagittifolia

Mimosa pudica

Spermacoce ocyrnoides

Endostemon viscosus

Cascabela thevetia

Ipomoea pes-tigrisid
