WEAK PROJECTIONS ONTO A BRAIDED HOPF ALGEBRA

A. ARDIZZONI, C. MENINI, AND D. ŠTEFAN

ABSTRACT. We show that, under some mild conditions, a bialgebra in an abelian and coabelian braided monoidal category has a weak projection onto a formally smooth (as a coalgebra) sub-bialgebra with antipode; see Theorem 1.12. In the second part of the paper we prove that bialgebras with weak projections are cross product bialgebras; see Theorem 2.12. In the particular case when the bialgebra $A$ is cocommutative and a certain cocycle associated to the weak projection is trivial we prove that $A$ is a double cross product, or biproduct in Madjid’s terminology. The last result is based on a universal property of double cross products which, by Theorem 2.15 works in braided monoidal categories. We also investigate the situation when the right action of the associated matched pair is trivial.

INTRODUCTION

Hopf algebras in a braided monoidal category are very important structures. Probably the first known examples are $\mathbb{Z}$-graded and $\mathbb{Z}_2$-graded bialgebras (also called superbialgebras), that already appeared in the work of Milnor-Moore and MacLane. Other examples, such as bialgebras in the category of Yetter-Drinfeld modules, arose in a natural way in the characterization as a double crossed product of (ordinary) Hopf algebras with a projection. Some braided bialgebras have also played a central role in the theory of quantum groups.

The abundance of examples and their applications explain the increasing interest for these objects and the attempts in describing their structure. For example in BD1 BD2 BD3, several generalized versions of the double cross product bialgebra in a braided monoidal category $\mathcal{M}$, generically called cross product bialgebras, are constructed. All of them have the common feature that, as objects in $\mathcal{M}$, they are the tensor product of two objects in $\mathcal{M}$. Let $A$ be such a cross product, and let $R$ and $B$ the corresponding objects such that $A \simeq R \otimes B$. Depending on the particular type of cross product, the objects $R$ and $B$ may have additional properties, like being algebras and/or coalgebras. These structures may also satisfy some compatibility relations. For example, we can look for those cross product bialgebras $A \simeq R \otimes B$ such that there are a bialgebra morphism $\sigma : B \to A$ and a right $B$-linear coalgebra map $\pi : A \to B$ satisfying the relation $\pi \sigma = \text{Id}_B$ (here $A$ is a $B$-module via $\sigma$). For simplicity, we will say that $A$ is a bialgebra (in $\mathcal{M}$) with weak projection $\pi$ on $B$. In the case when $\mathcal{M}$ is the category of vector spaces, the problem of characterizing bialgebras with a weak projection was considered in Schanuel.

The purpose of this is two fold. We assume that $\mathcal{M}$ is a semisimple abelian and coabelian braided monoidal category (see Definition 1.1) and that $\sigma : B \to A$ is morphism of bialgebras in $\mathcal{M}$. First, we want to show that there is a retraction $\pi$ of $\sigma$ which is a right $B$-linear morphism of coalgebras, provided that $B$ is formally smooth as a coalgebra and that the $B$-adic coalgebra filtration on $A$ is exhaustive (see Theorem 1.12). Secondly, assuming that a retraction $\pi$ as above exists, we want to show that $A$ is factorizable and to describe the corresponding structure $R$ that arises in this situation. For this part of the paper we use the results of BD3, that help us to prove that $A$ is the cross product algebra $R \rtimes B$ where $R$ is the ‘coinvariant’ subobject with respect to the right coaction of $B$ on $A$ defined by $\pi$ (see Theorem 2.12). Several particular cases are also investigated. In Theorem 2.18 under the additional assumption that $A$ is cocommutative and a certain cocyle...
is trivial, we describe the structure of $A$ as a biproduct bialgebra of a certain matched pair (see Theorem 2.15).

Finally, we would like to note that some applications of the last mentioned result and its corollaries (see Proposition 2.18) are given in [AMS3]. As a matter of fact, our interest for the problems that we study in this paper originates in our work on the structure of cocommutative Hopf algebras with dual Chevalley property from [AMS3]. In particular, [AMS3, Theorem 6.14] and [AMS3, Theorem 6.16] are direct consequences of the main results of this article.

1. Hopf algebras in a braided category $\mathcal{M}$

**Definition 1.1.** An abelian monoidal category is a monoidal category $(\mathcal{M}, \otimes, 1)$ such that:

1. $\mathcal{M}$ is an abelian category
2. both the functors $X \otimes (-) : \mathcal{M} \to \mathcal{M}$ and $(-) \otimes X : \mathcal{M} \to \mathcal{M}$ are additive and right exact, for every object $X \in \mathcal{M}$.

A coabelian monoidal category is a monoidal category $(\mathcal{M}, \otimes, 1)$ such that:

1. $\mathcal{M}$ is an abelian category
2. both the functors $X \otimes (-) : \mathcal{M} \to \mathcal{M}$ and $(-) \otimes X : \mathcal{M} \to \mathcal{M}$ are additive and left exact, for every object $X \in \mathcal{M}$.

**Definitions 1.2.** A braided monoidal category $(\mathcal{M}, \otimes, 1, c)$ is a monoidal category $(\mathcal{M}, \otimes, 1)$ equipped with a braiding $c$, that is a natural isomorphism $c_{X,Y} : X \otimes Y \to Y \otimes X$ satisfying

$$c_{X \otimes Y, Z} = (c_{X, Z} \otimes Y)(X \otimes c_{Y, Z})$$

and

$$c_{X, Y \otimes Z} = (Y \otimes c_{X, Z})(c_{X, Y} \otimes Z).$$

For further details on these topics, we refer to [Km, Chapter XIII].

A bialgebra $(B, m, u, \Delta, \varepsilon)$ in a braided monoidal category $(\mathcal{M}, \otimes, 1, c)$ consists of an algebra $(B, m, u)$ and a coalgebra $(B, \Delta, \varepsilon)$ in $\mathcal{M}$ such that the diagrams in Figure 1 are commutative.

![Figure 1. The definition of bialgebras in $\mathcal{M}$.](image)

**Theorem 1.15.** For any bialgebra $B$ in a monoidal category $(\mathcal{M}, \otimes, 1)$ we define the monoidal category $(\mathcal{M}_B, \otimes, 1)$ of right $B$-modules in $\mathcal{M}$ as in [BD1]. The tensor product of two right $B$-modules $(M, \mu_M)$ and $(N, \mu_N)$ carries a right $B$-module structure defined by:

$$\mu_{M \otimes N} = (\mu_M \otimes \mu_N)(M \otimes c_{N, B} \otimes B)(M \otimes N \otimes \Delta).$$

Moreover, if $(\mathcal{M}, \otimes, 1)$ is an abelian monoidal category, then $(\mathcal{M}_B, \otimes, 1)$ is an abelian monoidal category too. Assuming that $(\mathcal{M}, \otimes, 1)$ is abelian and coabelian one proves that $(\mathcal{M}_B, \otimes, 1)$ is coabelian too.

Obviously, $(B, \Delta, \varepsilon)$ is a coalgebra both in $(\mathcal{M}_B, \otimes, 1)$ and $(\mathcal{M}_B, \otimes, 1)$. Of course, in both cases, $B$ is regarded as a left and a right $B$-module via the multiplication on $B$. 

1.4. To each coalgebra \((C, \Delta, \varepsilon)\) in \((\mathcal{M}, \otimes, 1, a, l, r)\) one associates a class of monomorphisms
\[ C\mathcal{C} := \{g \in C\mathcal{M}C \mid \exists f \in \mathcal{M} \text{ s.t. } fg = \text{Id}\}. \]
Recall that \(C\) is coseparable whenever the comultiplication \(\Delta\) cosplits in \(C\mathcal{M}\). We say that \(C\) is formally smooth in \(\mathcal{M}\) if Coker\(\Delta_C\) is \(C\mathcal{C}\)-injective. For other characterizations and properties of coseparable and formally smooth coalgebras the reader is referred to [AMS1] and [AT1]. In the same papers one can find different equivalent definitions of separable functors.

1.5. Let \((F, \phi_0, \phi_2) : (\mathcal{M}, \otimes, 1, a, l, r) \to (\mathcal{M}', \otimes', 1', a', l', r')\) be a monoidal functor between two monoidal categories, where \(\phi_2(U, V) : F(U \otimes V) \to F(U) \otimes' F(V)\), for any \(U, V \in \mathcal{M}\) and \(\phi_0 : 1' \to F(1)\). If \((C, \Delta, \varepsilon)\) is a coalgebra in \(\mathcal{M}\) then \((C', \Delta', \varepsilon') := (F(C), \Delta_{F(C)}, \varepsilon_{F(C)})\) is a coalgebra in \(\mathcal{M}'\), with respect to the comultiplication and the counit given by
\[ \Delta_{F(C)} := \phi_2^{-1}(C, \varepsilon(C)F(\Delta)), \quad \varepsilon_{F(C)} := \phi_0^{-1}(\varepsilon). \]
Let us consider the functor \(F' : C\mathcal{M} \to C'\mathcal{M}'\) that associates to \((M, C_{\rho_M}, \rho_M^C)\) the object \((F(M), C_{\rho_{FM}}, \rho_{FM}^C)\), where
\[ C_{\rho_{FM}} := \phi_2^{-1}(C, M)F(\rho_M), \quad \rho_{FM}^C := \phi_2^{-1}(M, C)F(\rho_M^C). \]

The proposition below is a restatement of [AT1] Proposition 4.21, from which we have kept only the part that we need to prove Theorem 1.7.

**Proposition 1.6.** Let \(\mathcal{M}, \mathcal{M}', C, C', F\) and \(F'\) be as in [AT2]. We assume that \(\mathcal{M}\) and \(\mathcal{M}'\) are coalgebra monoidal categories.

a) If \(C\) is coseparable in \(\mathcal{M}\) then \(C'\) is coseparable in \(\mathcal{M}'\); the converse is true whenever \(F'\) is separable.

b) Assume that \(F\) preserves cokernels. If \(C\) is formally smooth as a coalgebra in \(\mathcal{M}\) then \(C'\) is formally smooth as a coalgebra in \(\mathcal{M}'\); the converse is true whenever \(F'\) is separable.

Now we can prove one of the main results of this section.

**Theorem 1.7.** Let \(B\) be a Hopf algebra in a braided abelian and coalgebra monoidal category \((\mathcal{M}, \otimes, 1, \varepsilon)\). We have that:

a) \(B\) is coseparable in \((\mathcal{M}_B, \otimes, 1)\) if and only if \(B\) is coseparable in \((\mathcal{M}, \otimes, 1)\).

b) \(B\) is formally smooth as a coalgebra in \((\mathcal{M}_B, \otimes, 1)\) if and if \(B\) is formally smooth as a coalgebra in \((\mathcal{M}, \otimes, 1)\).

**Proof.** We apply Proposition 1.6 in the case when \(\mathcal{M} := (\mathcal{M}_B, \otimes, 1)\) and \(\mathcal{M}' := (\mathcal{M}, \otimes, 1)\), which are coalgebra categories. We take \((F, \phi_0, \phi_2) : (\mathcal{M}_B, \otimes, 1) \to (\mathcal{M}, \otimes, 1)\) to be the forgetful functor from \(\mathcal{M}_B\) to \(\mathcal{M}\), where \(\phi_0 = \text{Id}_1\) and, for any \(U, V \in \mathcal{M}_B\), we have \(\phi_2(U, V) = \text{Id}_{U \otimes V}\). We also take \(F'\) to be the forgetful functor from \(B\mathcal{M}_B\) to \(B\mathcal{M}\). Since \((\mathcal{M}, \otimes, 1)\) is an abelian monoidal category, then the functor \((-) \otimes B : \mathcal{M} \to \mathcal{M}\) is additive and right exact. Hence \(F\) preserves cokernels, see [AT2] Theorem 3.6). Thus, in view of Proposition 1.6 to conclude the proof of the theorem, it is enough to show that \(F'\) is a separable functor.

For each \((M, B_B, \rho_B^M) \in B\mathcal{M}\) we define \((M^{coB}, \rho_{M^{coB}})\) to be the equalizer of the maps
\[ \rho_B^M : M \to M \otimes B \quad \text{and} \quad (M \otimes u_B) r_M^{-1} : M \to M \otimes B. \]
Since \(B\) is right flat (\(\mathcal{M}\) is an abelian monoidal category), we can apply the dual version of [AT2] Proposition 3.3 to show that \((M^{coB}, \rho_{M^{coB}})\) inherits from \(M\) a natural left \(B\)-comodule structure \(B_{M^{coB}} : M^{coB} \to B \otimes M^{coB}\). As a matter of fact, with respect to this comodule structure, \(M^{coB}\) is the kernel of \(\rho_B^M - (M \otimes u_B) r_M^{-1}\) in the category \(B\mathcal{M}\). We obtain a functor \(F'' : B\mathcal{M} \to B\mathcal{M}\) defined by:
\[ F''(M, B_B, \rho_B^M) = (M^{coB}, B_{M^{coB}}). \]
Then \(F'' \circ F'\) associates to \((M, B_B, \rho_B^M, \rho_B^M)\) the left \(B\)-comodule \((M^{coB}, B_{M^{coB}})\) in \(\mathcal{M}\). By the dual version of [BD1] Proposition 3.6.3, it results that \(F'' \circ F'\) is a monoidal equivalence. Therefore \(F'' \circ F'\) is a separable functor and hence \(F'\) is separable too. \(\Box\)
A convenient way to check that a Hopf algebra $B$ is coseparable in $\mathcal{M}$ is to show that $B$ has a total integral in $\mathcal{M}$. This characterization of coseparable Hopf algebras will be proved next.

**Definition 1.8.** Let $B$ be a Hopf algebra in a braided abelian and coabelian monoidal category $(\mathcal{M}, \otimes, 1, c)$. A morphism $\lambda : B \to 1$ in $\mathcal{M}$ is called a (left) total integral if it satisfies the relations:

1. $r_B(B \otimes \lambda)\Delta = u\lambda,$
2. $\lambda u = \text{Id}_1.$

1.9. In order to simplify the computation we will use the diagrammatic representation of morphisms in a braided category. For details on this method the reader is referred to [Ka, XIV.1]. On the first line of pictures in Figure 2 are included the basic examples: the representation of a morphism $f : V \to W$ (downwards, the domain up) and the diagrams of $f' \circ f''$, $g' \otimes g''$ and $c_{V,W}$. The last four diagrams denote respectively the multiplication, the comultiplication, the unit and the counit of a bialgebra $B$ in $\mathcal{M}$. The graphical representation of associativity, existence of unit, coassociativity, existence of counit, compatibility between multiplication and comultiplication, the fact that $\varepsilon$ is a morphism of algebras and the fact that $u$ is a morphism of coalgebras can be found also in Figure 2 (second line). The last two pictures on the same line are equivalent to the definition of a total integral. The fact that the right hand side of the last equality is empty means that we can remove the left hand side in any diagrams that contains it.

**Proposition 1.10.** A Hopf algebra $B$ in an abelian and coabelian braided monoidal category $\mathcal{M}$ is coseparable in $\mathcal{M}_B$ if and only if it has a total integral. In this case, $B$ is formally smooth as a coalgebra in $\mathcal{M}_B$.

**Proof.** We first assume that there is a total integral $\lambda : B \to 1$. Let us show that:

$$l_B(\lambda m \otimes B)(B \otimes S \otimes B)(B \otimes \Delta) = r_B(B \otimes \lambda m)(B \otimes B \otimes S)(\Delta \otimes B).$$

The proof is given in Figure 3. The first equality follows by relation (1) and the definition of $u$. The second relation is a consequence of the fact that $B$ is a bialgebra in $\mathcal{M}$, so $\Delta m = (m \otimes c_{B,B \otimes m})(\Delta \otimes \Delta)$. The third equation follows by the fact that the antipode $S$ is an anti-morphism of coalgebras, i.e. $\Delta S = (S \otimes S)c_{B,B \otimes \Delta}$. For the fourth equality we used that the braiding is a functorial morphisms (thus $m, S$ and $\lambda$ can be pulled along the string over and under any crossing).

The last two equalities follow $m(S \otimes \Delta) = u\varepsilon$ and the properties of $\varepsilon$ and $u$.

We now define $\theta : B \otimes B \to B$ by $\theta(x \otimes y) = l_B(\lambda m \otimes B)(B \otimes S \otimes B)(B \otimes \Delta)$. We have to prove that $\theta$ is a section of $\Delta$ in the category of $B$-bicomodules in $\mathcal{M}_B$. Note that the category of $B$-bicomodules in $\mathcal{M}_B$ is $B\mathcal{M}_B^0$. An object $M \in \mathcal{M}_B$ is in $B\mathcal{M}_B^0$ if it is a right $B$-module and a $B$-bicomodule such that $M$ is a Hopf module both in $B\mathcal{M}_B$ and $\mathcal{M}_B^0$.

Let us show that $\theta$ is a $B$-bicolinear section of $\Delta$. Taking into account relation (3), we prove that $\theta$ is left $B$-bicolinear in the first equality from Figure 3. The fact that $\theta$ is right $B$-bicolinear is proved in the second equality of the same figure. In both of them, we used that $\Delta$ is coassociative and that the comodule structures on $B$ and $B \otimes B$ are defined by $\Delta, B \otimes \Delta$ and $\Delta \otimes B$. To show that $\theta$ is a section of $\Delta$ we use that $\lambda u = \text{Id}_1$, see the last sequence of equalities from Figure 3.

It remains to prove that $\theta$ is right $B$-linear. This is done in Figure 3. The first equality was obtained by using the fact that $\Delta$ is a morphism of algebras and that $S$ is an anti-morphism of algebras, i.e. $mS = (S \otimes S)c_{B,B \otimes m}$. To get the second equality we pulled $S$ and $\Delta$ under a crossing (this is possible because the braiding is functorial). For the third equality we used associativity and coassociativity. The fourth and the fifth equalities result by the definitions of the antipode, unit and counit. To deduce the sixth equality we pulled $m$ and $\lambda$ over the crossing.

Conversely, let $\theta : B \otimes B \to B$ be a section of $\Delta$, which is a morphism of $B$-bicomodules in $\mathcal{M}_B$. Let $\lambda := \varepsilon \theta(B \otimes u)r_B^{-1}$. Since $\theta$ is a morphism of right $B$-comodules it results that

$$\Delta \theta(B \otimes u)r_B^{-1} = [\theta(B \otimes u)r_B^{-1} \otimes u)r_B^{-1}.$$ 

Then, by applying $\varepsilon \otimes B$, we get $\theta(B \otimes u)r_B^{-1} = u\lambda$. As $\theta$ is $B$-colinear, we have:

$$\Delta \theta(B \otimes u)r_B^{-1} = (B \otimes \theta)((\Delta \otimes u)r_B^{-1}).$$

Therefore, by the definition of $\lambda$, we get (1). Since $\theta$ is a section of $\Delta$ we deduce that $\lambda u = \text{Id}_1$. $\square$
Figure 2. Diagrammatic representation of morphisms in $\mathcal{M}$.

Figure 3. The proof of relation (3).

Figure 4. The map $\theta$ is a $B$-bilinear section of $\Delta$.

Figure 5. The map $\theta$ is $B$-linear.
Recall that, for a right \( \rho \)-comodule \( (M, \rho) \), the subspace of coinvariant elements \( M^{\co(H)} \) is defined by setting \( M^{\co(H)} = \{ m \in M \mid \rho(m) = m \otimes 1 \} \). If \( A \) is an algebra in \( \mathcal{M}^H \) then \( A^{\co(H)} \) is a subalgebra of \( A \).
When $H$ is a cosemisimple coquasitriangular Hopf algebra, then $\mathcal{M}^H$ is a semisimple braided monoidal category. Note that bialgebras in $\mathcal{M}^H$ are usual coalgebras, so we can speak about the coradical of a bialgebra in this category.

**Corollary 1.14.** Let $H$ be a cosemisimple coquasitriangular Hopf algebra and let $A$ be a bialgebra in $\mathcal{M}^H$. Let $B$ denote the coradical of $A$. Suppose that $B$ is a sub-bialgebra of $A$ (in $\mathcal{M}^H$) with antipode. If $B \subseteq A^{co(H)}$ then there is a right weak projection $\pi: A \to B$ in $\mathcal{M}^H$.

**Proof.** Since $B \subseteq A^{co(H)}$ it follows that $c_{B,B}$ is the usual flip map and $B$ is an ordinary cosemisimple Hopf algebra. A Hopf algebra is cosemisimple if and only if there is $\lambda: B \to K$ such that $\mathbf{1}$ and $\mathbf{2}$ hold true (see e.g. [DNR, Exercise 5.5.9]). Obviously $\lambda$ is a morphism of $H$-comodules, as $B \subseteq A^{co(H)}$. The conclusion follows by Theorem 1.12. \(\square\)

### 2. Weak Projections onto a Braided Hopf Algebra

Our main aim in this section is to characterize bialgebras in a braided monoidal category with a weak projection onto a Hopf subalgebra.

#### 2.1. Throughout this section we will keep the following assumptions and notations.

1) $(\mathfrak{M}, \otimes, 1, c)$ is an abelian and coabelian braided monoidal category;
2) $(A, m_A, u_A, \Delta_A, \varepsilon_A)$ is a bialgebra in $\mathfrak{M}$;
3) $(B, m_B, u_B, \Delta_B, \varepsilon_B)$ is a sub-bialgebra of $A$ that has an antipode $S_B$ (in particular $B$ is a Hopf algebra in $\mathfrak{M}$);
4) $\sigma: B \to A$ denotes the canonical inclusion (of course, $\sigma$ is a bialgebra morphism);
5) $\pi: A \to B$ is a right weak projection onto $B$ (thus $\pi$ is a morphism of coalgebras in $\mathfrak{M}_B$, where $A$ is a right $B$-module via $\sigma$, and $\pi\sigma = \text{Id}_B$);
6) We define the following three endomorphisms (in $\mathfrak{M}$) of $A$:

\[
\Phi := \sigma S_B \pi, \quad \Pi_1 := \sigma \pi, \quad \Pi_2 := m_A (A \otimes \Phi) \Delta_A.
\]

Our characterization of $A$ as a generalized crossed product is based on the work of Bespalov and Drabant [BD3]. We start by proving certain properties of the operators $\Phi$, $\Pi_1$ and $\Pi_2$. They will be used later on to show that the conditions in [BD3, Proposition 4.6] hold true.

**Lemma 2.2.** Under the assumptions and notations in (2.1), $\Pi_1$ is a coalgebra homomorphism such that $\Pi_1 \Pi_1 = \Pi_1$ and

\[
m_A (\Pi_1 \otimes \Pi_1) = \Pi_1 m_A (\Pi_1 \otimes \Pi_1).
\]

**Proof.** Obviously $\Pi_1$ is a coalgebra homomorphism as $\sigma$ and $\pi$ are so. Trivially $\Pi_1$ is an idempotent, as $\sigma \pi = \text{Id}_B$. Furthermore, we have

\[
m_A (\Pi_1 \otimes \Pi_1) = m_A (\sigma \pi \otimes \sigma \pi) = \sigma m_B (\pi \otimes \pi) = \sigma \pi [\sigma m_B (\pi \otimes \pi)] = \Pi_1 m_A (\Pi_1 \otimes \Pi_1),
\]

so the lemma is proved. \(\square\)

**Lemma 2.3.** Under the assumptions and notations in (2.1) we have:

\[
\Delta_A \circ \Pi_2 = (m_A \otimes A) \circ (A \otimes \Phi \otimes \Pi_2) \circ (A \otimes c_{A,A} \circ \Delta_A) \circ \Delta_A
\]

**Proof.** See Figure 6 on page 9. The first equality is directly obtained from the definition of $\Pi_2$. The second equation follows by the compatibility relation between the multiplication and the comultiplication of a bialgebra in a braided monoidal category. For the third equality we used the definition of $\Phi := \sigma S_B \pi$, that $\pi$ and $\sigma$ are coalgebra homomorphisms and the fact that $S_B$ is an anti-homomorphism of coalgebras in $\mathfrak{M}$, i.e. $\Delta S_B = (S_B \otimes S_B) c\Delta$. The fourth relation resulted by coassociativity, while the last one was deduced (in view of naturality of the braiding) by dragging down one of the comultiplication morphisms over the crossing and by applying the definition of $\Pi_2$. \(\square\)

**Lemma 2.4.** Under the assumptions and notations in (2.1) we have:

\[
\pi \circ \Pi_2 = u_B \circ \varepsilon_A
\]
Proof. See Figure 8 on page 10. By the definition of \( \Pi_2 \) we have the first relation. The second one follows by the fact \( \pi \) is right \( B \)-linear (recall that the action of \( B \) on \( A \) is defined by \( \sigma \)). To deduce the third equality we use that \( \pi \) is a morphism of coalgebras, while the last relations follow immediately by the properties of the antipode, unit, counit and \( \pi \). □

**Lemma 2.5.** Under the assumptions and notations in (2.1) we have:

\[
(A \otimes \pi) \circ \Delta_A \circ \Pi_2 = (\Pi_2 \otimes u_B) \circ r_A^{-1}
\]

Proof. See Figure 8 on page 10. For the first equality we used relation (5). The second one follows by (6), while the third one is a consequence of the compatibility relation between the counit and the braiding and the compatibility relation between the counit and the comultiplication. The last equation is just the definition of \( \Pi_2 \). □

**Lemma 2.6.** Under the assumptions and notations in (2.1) we have:

\[
\Pi_2 m_A (A \otimes \sigma) = \Pi_2 r_A (A \otimes \varepsilon_B) = r_A (\Pi_2 \otimes \varepsilon_B)
\]

Proof. The proof can be found in Figure 9 on page 10. The first and the second equalities are implied by the definition of \( \Pi_2 \) and, respectively, the compatibility relation between multiplication and comultiplication in a bialgebra. For the next relation one uses the definition of \( \Phi \) and that \( \sigma \) is a morphism of coalgebras. The fourth relation holds as \( \sigma \) is right \( B \)-linear (the \( B \)-action on \( A \) is defined via \( \sigma \)). The fifth and the sixth equalities follow as \( \sigma \) is a morphism of coalgebras and \( S_B \) is an anti-morphism of coalgebras and, respectively, by associativity in \( A \). As the braiding is functorial (so \( \Delta_B(B \otimes S_B) \) can be dragged under the braiding) and \( \sigma \) is a morphism of algebras we get the seventh equality. To get the eighth relation we used the definition of the antipode, while the last one is implied by the properties of the unit and counit in a Hopf algebra, and the definition of \( \Pi_2 \). □

**Lemma 2.7.** Under the assumptions and notations in (2.1), \( \Pi_2 \) is an idempotent such that:

\[
(\Pi_2 \otimes \Pi_2) \Delta_A = (\Pi_2 \otimes \Pi_2) \Delta_A \Pi_2.
\]

Proof. Let us first prove that

\[
\Pi_2 \Pi_2 = \Pi_2,
\]

that is \( \Pi_2 \) is an idempotent. We have

\[
\Pi_2 \Pi_2 = m_A (A \otimes \sigma S_B \pi) \Delta_A \Pi_2 = m_A (A \otimes \sigma S_B) (A \otimes \pi) \Delta_A \Pi_2 = m_A (A \otimes \sigma S_B) (\Pi_2 \otimes u_B) r_A^{-1}.
\]

Since \( \sigma \) and \( S_B \) are unital morphisms and the right unity constraint \( \varepsilon \) is functorial we get

\[
\Pi_2 \Pi_2 = m_A (A \otimes u_A) (\Pi_2 \otimes 1) r_A^{-1} = m_A (A \otimes \varepsilon_B) r_A^{-1} \Pi_2 = \Pi_2.
\]

For the proof of equation (8) see Figure 8 on page 10. In that figure, we get the first equality by using (7). The next two relations are consequences of the definition of \( \Phi \), relation (1) and relation (8). Finally, to obtain the last equality we use the properties of the antipode and of the counit, together with the fact that \( \varepsilon_B \pi = \varepsilon_A \). □

**Lemma 2.8.** Under the assumptions and notations in (2.1) we have:

\[
\Pi_1 u_A = u_A \quad \text{and} \quad \varepsilon_A \Pi_2 = \varepsilon_A.
\]

Proof. The first relation is easy: \( \Pi_1 u_A = \sigma \pi u_A = \sigma \pi \sigma u_B = \sigma u_B = u_A \). To prove the second one we perform the following computation:

\[
\varepsilon_A \Pi_2 = \varepsilon_A m_A (A \otimes \sigma S_B \pi) \Delta_A = m_A (A \otimes \varepsilon_B) (A \otimes \sigma S_B \pi) \Delta_A.
\]

Therefore, by the properties of the counit of a Hopf algebra in braided monoidal category, we get

\[
\varepsilon_A \Pi_2 = r_1 (\varepsilon_A \otimes 1) (A \otimes \varepsilon_A) \Delta_A = \varepsilon_A r_A (A \otimes \varepsilon_A) \Delta_A = \varepsilon_A,
\]

so the lemma is completely proved. □

**Lemma 2.9.** Under the assumptions and notations in (2.1), the homomorphisms \( m_A \circ (\Pi_2 \otimes \Pi_1) \) and \( (\Pi_2 \otimes \Pi_1) \circ \Delta_A \) split the idempotent \( \Pi_2 \otimes \Pi_1 \).
Proof. We have to prove that
\[ m_A (\Pi_2 \otimes \Pi_1) (\Pi_2 \otimes \Pi_1) \Delta_A = \text{Id}_A, \]
\[ (\Pi_2 \otimes \Pi_1) \Delta_A m_A (\Pi_2 \otimes \Pi_1) = \Pi_1 \otimes \Pi_2. \]

The proof of relation (12) is shown in Figure 11 on page 11. The first three equalities are simple consequences of the fact \( \Pi_1 \) and \( \Pi_2 \) are idempotents, of the definitions of these homomorphisms and of (co)associativity in \( A \). For the fourth relation we used the definition of \( \Phi \) and that \( \pi \) is a morphism of coalgebras and \( \sigma \) is a morphism of algebras. The last two relations result by the definitions of the antipode, unit and counit in a Hopf algebra, together with \( \varepsilon_B \pi = \varepsilon_A \) and \( \sigma u_B = u_A \).

The proof of relation (13) is shown in Figure 12 on page 11. The first two equalities immediately follow by the compatibility relation between multiplication and comultiplication on \( A \), the fact that \( \Pi_1 \) is a coalgebra homomorphism and \( \Pi_1 = \sigma \pi \). By using (8) and \( \pi m_A (A \otimes \sigma) = m_B (\pi \otimes B) \), that is \( \pi \) is right \( B \)-linear, we get the third relation. The relation \( \varepsilon_B \pi = \varepsilon_A \), the fact that the braiding is functorial and the properties of the counit are used to obtain the fourth equality. The fifth one is implied by (7), while to prove the last equality one uses \( \Pi_2 \Pi_2 = \Pi_2 \), the definition of the unit and the definition of \( \Pi_1 \). □

Lemma 2.10. Under the assumptions and notations in (2.1), let
\[ (R, i) := \text{Eq} [(A \otimes \pi) \Delta_A, (A \otimes u_B) r_A^{-1}]. \]

Then there exists a unique morphism \( p : A \to R \) such that
\[ ip = \Pi_2 \quad \text{and} \quad pi = \text{Id}_R. \]

Proof. First of all, we have
\[ (A \otimes \pi) \Delta_A \circ \Pi_2 = (\Pi_2 \otimes u_H) \circ r_A^{-1} = (A \otimes u_H) \circ (\Pi_2 \otimes 1) \circ r_A^{-1} = (A \otimes u_H) \circ r_A^{-1} \circ \Pi_2. \]

Thus, by the universal property of the equalizer, there is a unique morphism \( p : A \to R \) such that \( ip = \Pi_2 \). We have
\[ ipi = \Pi_2 i = m_A (A \otimes \sigma S_B \pi) \Delta_A i = m_A (A \otimes \sigma S_B) (A \otimes \pi) \Delta_A i \]
\[ = m_A (A \otimes \sigma S_B) (A \otimes u_B) r_A^{-1} i = m_A (A \otimes u_A) r_A^{-1} i = i. \]

Since \( i \) is a monomorphism we get \( pi = \text{Id}_R \) so that \( i \) and \( p \) split the idempotent \( \Pi_2 \). □

Figure 6. The proof of Eq. (13).
Figure 7. The proof of Eq. (8).

Figure 8. The proof of Eq. (6).

Figure 9. The proof of Eq. (7).

Figure 10. The proof of Eq. (9).
Before proving one of the main results of this paper, Theorem 2.12, we introduce some more notations and terminology. First of all the object \( R \), that we introduced in Lemma 2.10, will be called the diagram of \( A \). Note that \( R \) is the ‘coinvariant subobject’ of \( A \) with respect to the right \( B \)-coaction induced by the coalgebra homomorphism \( \pi \).

We now associate to the weak projection \( \pi \) the following data:

\[
\begin{align*}
m_R & : R \otimes R \to R, & m_R := pm_A (i \otimes i); \\
u_R & : 1 \to R, & u_R := pu_A; \\
\Delta_R & : R \to R \otimes R, & \Delta_R = (p \otimes p)\Delta_A i; \\
\varepsilon_R & : R \to 1, & \varepsilon_R = \varepsilon_A i; \\
\xi & : R \otimes R \to B, & \xi := \pi m_A (i \otimes i); \\
\mu_R^B & : B \otimes R \to R, & \mu_R^B := pm_A (\sigma \otimes i); \\
\mu_B^R & : R \otimes B \to R, & \mu_B^R := pm_A (i \otimes \sigma); \\
\rho_R & : R \to B \otimes R, & \rho_R := (\sigma \otimes p)\Delta_A i; \\
\mu_R^B & : B \otimes R \to B, & \mu_B^R := \pi m_A (\sigma \otimes i).
\end{align*}
\]

**Theorem 2.12.** We keep the assumptions and notations in (2.1) and (2.11).

1) The diagram \( R \) is a coalgebra with comultiplication \( \Delta_R \) and counit \( \varepsilon_R \), and \( p \) is a coalgebra homomorphism.

2) The morphisms \( m_A (i \otimes \sigma) \) and \((p \otimes \pi)\Delta_A \) are mutual inverses, so that \( R \otimes B \) inherits a bialgebra structure which is the cross product bialgebra \( R \times B \) defined by

\[
\begin{align*}
m_{R \times B} & = (R \otimes m_B)(m_R \otimes \xi \otimes B)(R \otimes \mu_R^B \otimes R \otimes R \otimes m_B)(R \otimes B \otimes \varepsilon_R \otimes R \otimes B \otimes B) \\
& \quad (R \otimes \rho_R \otimes R \otimes R \otimes B \otimes B)(\Delta_R \otimes \Delta_R \otimes B \otimes B)(R \otimes \mu_R^B \otimes \mu_B^R \otimes B) \\
u_{R \times B} & = (u_R \otimes u_B)\Delta_1, \\
\Delta_{R \times B} & = (R \otimes m_B \otimes R \otimes B)(R \otimes B \otimes c_{R,B} \otimes B)(R \otimes \rho_R \otimes B \otimes B)(\Delta_R \otimes \Delta_B), \\
\varepsilon_{R \times B} & = m_1 (\varepsilon_R \otimes \varepsilon_B).
\end{align*}
\]
We will follow the proof of [Maj, Theorem 7.2.3]. Thus (1) and (3) of the same result hold. In our case it can be checked that:

\[
(B_1, p_1, i_1) = (B, \sigma, \pi) \quad \text{and} \quad (B_2, p_2, i_2) = (R, i, p).
\]

The explicit form of \(m_{R \bowtie B}\) and \(\Delta_{R \bowtie B}\) is a right hand version of the one in the fourth box of diagrams in [BD3] Table 2, page 480. \(\square\)

We are now going to investigate a particular case of the above theorem. Namely, when \(A\) is cocommutative and \(\xi\) is trivial, we will show that \(A\) is the double cross product of a matched pair (see definitions below).

**Definition 2.13.** Let \((R, m_R, u_R, \Delta_R, \varepsilon_R)\) and \((B, m_B, u_B, \Delta_B, \varepsilon_B)\) be bialgebras in a braided abelian and coabelian monoidal category \((\mathcal{M}, \otimes, 1, c)\). Following [Maj] Definition 7.2.1, page 298, we say that \((R, B)\) defines a **matched pair of bialgebras** if there exist morphisms

\[
\triangleright : B \otimes R \to R \quad \text{and} \quad \triangleleft : B \otimes R \to B
\]

satisfying the seven conditions below:

1. \((R, \Delta_R, \varepsilon_R, \triangleright)\) is a left \(B\)-module coalgebra;
2. \((B, \Delta_B, \varepsilon_B, \triangleleft)\) is a right \(R\)-module coalgebra;
3. \(\langle u_B \otimes R \rangle = u_B \varepsilon_R l_R\);
4. \(\triangleright (u_R \otimes R) = u_R \varepsilon_B r_B\);
5. \(m_B(\langle \otimes B \rangle(B \triangleright \partial \otimes \triangleleft))(B \otimes \Delta_B \otimes R) = \langle m_R \otimes B \rangle\);
6. \(m_R(R \triangleright \partial)(B \otimes \varepsilon_B \otimes R)(\Delta_B \otimes R) = \triangleright (B \otimes m_R)\);
7. \((\langle \otimes \partial \rangle \Delta_{B \otimes R} = c_{R,B}(\triangleright \otimes \triangleleft) \Delta_{B \otimes R}^\otimes\).

In this case, for sake of shortness, we will say that \((R, B, \triangleright, \triangleleft)\) is a **matched pair of bialgebras** in \((\mathcal{M}, \otimes, 1, c)\).

**2.14.** Let \((R, B, \triangleright, \triangleleft)\) be a matched pair. By [BD2] Corollary 2.17, we get that:

\[
m_{R \bowtie B} = (m_R \otimes m_B)(R \otimes \triangleright \otimes \triangleleft \otimes B)(R \otimes B \otimes c_{B,R} \otimes R \otimes B)(R \otimes \Delta_B \otimes \Delta_R \otimes B),
\]

\[
u_{R \bowtie B} = (u_R \otimes u_B) \Delta_1,
\]

\[
\Delta_{R \bowtie B} = (R \otimes c_{R,B} \otimes B)(\Delta_R \otimes \Delta_B),
\]

\[
\varepsilon_{R \bowtie B} = m_1(\varepsilon_R \otimes \varepsilon_B).
\]

defines a new bialgebra \(R \bowtie B\), that is called the **double cross product bialgebra**. It can be obtained as a particular case of the cross product bialgebra \(R \bowtie B\) by setting \(B \mu_R = \triangleleft, B \mu_B = \triangleright\) and taking \(\xi, B \rho_R\) and \(B \rho_B\) to be trivial in \([2.11]\).

**Theorem 2.15.** Let \(\sigma : B \to A\) and \(i : R \to A\) be bialgebra morphisms in a braided monoidal category \((\mathcal{M}, \otimes, 1, c)\) such that \(\Phi := m_A(i \otimes \sigma)\) is an isomorphism in \(\mathcal{M}\). Let \(\Psi := \Phi^{-1}\Theta\), where \(\Theta : B \otimes R \to A\) is defined by \(\Theta := m_A(\sigma \otimes i)\).

Consider the homomorphisms \(\triangleright : B \otimes R \to R\) and \(\triangleleft : B \otimes R \to B\) defined by:

\[
\triangleright := r_R(R \otimes \varepsilon_B)\Psi, \quad \triangleleft := l_B(\varepsilon_R \otimes B)\Psi.
\]

Then \((R, B, \triangleright, \triangleleft)\) is a matched pair and \(A \simeq R \bowtie B\).

**Proof.** We will follow the proof of [Maj] Theorem 7.2.3. It is easy to see that the proofs of relations [Maj] (7.10) and [Maj] (7.11) work in a braided monoidal category, as they can be done in a diagrammatic way. Therefore, we have:

\[
(15) \quad (R \otimes m_B)(\Psi \otimes B)(B \otimes \Psi) = \Psi(m_B \otimes R), \quad (B \otimes u_R)r_B^{-1} = (u_R \otimes B)l_B^{-1}.
\]

\[
(16) \quad (m_R \otimes B)(R \otimes \Psi)(\Psi \otimes R) = \Psi(B \otimes m_R), \quad (u_B \otimes B)r_B^{-1} = (R \otimes u_B)l_B^{-1}.
\]

For example the first relation in (15) is proved in Figure [13]. The first equivalence there holds since \(\Phi = m_A(i \otimes \sigma)\) is by assumption an isomorphism. The second and the third equivalences are consequences of associativity in \(A\) and of relation \(\Phi \Psi = \Theta\). Since the last equality is obviously true by associativity in \(A\), the required relation is proved. The second relation in (15) follows by
the computation performed in Figure 14. The first equality holds since \( \Phi \Psi = \Theta \), while the second results by the fact that \( i \) and \( \sigma \) are homomorphisms of algebras and by the definition of the unit in an algebra. To get the second relation in (15) we use the fact that \( \Phi \) is an isomorphism.

As in the proof of [Ma] Theorem 7.2.3, by applying \( l_B(\varepsilon_R \otimes B) \) and \( r_R(R \otimes \varepsilon_R) \) respectively to (16) and (15), we get that \( \triangleright \) defines a left action of \( B \) on \( R \) and \( \triangleleft \) defines a right action of \( R \) on \( B \). Indeed, by applying \( \varepsilon_R \otimes B \) to the second relation in (15) it is easy to see that \( \triangleleft \) is unital. The second axiom that defines a right action is checked in Figure 15.

By the two relations of (21) we deduce
\[
\Delta_B \triangleleft (m_B(\triangleright \otimes R)) = m_B(\triangleleft \otimes B)(B \otimes \Psi) \quad (17)
\]
\[
\triangleright (B \otimes m_R) = m_R(R \otimes \triangleleft)(\Psi \otimes R) \quad (18)
\]
For the proof of (17) see Figure 16. We now want to check that \( \Theta : B \otimes R \rightarrow A \) is a coalgebra homomorphism, where the coalgebra structure on \( B \otimes R \) is given by:
\[
\Delta_{B \otimes R} := (B \otimes c_{B,R} \otimes R)(\Delta_B \otimes \Delta_R), \quad \varepsilon_{B \otimes R} := m_1(\varepsilon_B \otimes \varepsilon_R).
\]
Indeed, we have
\[
\Delta_A \Theta = (m_A \otimes m_A)(A \otimes c_{A,A} \otimes A)(\Delta_A \otimes \Delta_A)(\sigma \otimes i)
\]
\[
= (m_A \otimes m_A)(A \otimes c_{A,A} \otimes A)(\sigma \otimes i \otimes i)(\Delta_B \otimes \Delta_R)
\]
\[
= (m_A \otimes m_A)(\sigma \otimes i \otimes i)(B \otimes c_{B,R} \otimes R)(\Delta_B \otimes \Delta_R)
\]
\[
= (\Theta \otimes \Theta)(B \otimes c_{B,R} \otimes R)(\Delta_B \otimes \Delta_R) = (\Theta \otimes \Theta)\Delta_{B \otimes R},
\]
and \( \varepsilon_A \Theta = m_1(\varepsilon_A \otimes \varepsilon_A)(\sigma \otimes i) = m_1(\varepsilon_B \otimes \varepsilon_R) = \varepsilon_{B \otimes R} \). In a similar way, by interchanging \( B \) and \( R \), we can prove that \( \Phi \) is a homomorphism of coalgebras. Thus \( \Psi = \Phi^{-1}\Theta \) is a coalgebra homomorphism too, so
\[
\Delta_{R \otimes B} \Psi = (\Psi \otimes \Psi)\Delta_{B \otimes R} \quad \text{and} \quad \varepsilon_{R \otimes B} \Psi = \varepsilon_{B \otimes R}.
\]
By applying \( l_B(\varepsilon_R \otimes B) \otimes l_B(\varepsilon_R \otimes B) \) to both sides of the first equality in (19) we get the first relation in Figure 17. By the properties of \( \varepsilon_B \) and \( \varepsilon_R \) we get the second relation in the same figure, that is we have:
\[
\Delta_B \triangleleft (\varepsilon_B \varepsilon_R B) = (\varepsilon_B \varepsilon_R B)\Delta_B \triangleleft.
\]
As \( \varepsilon_B \triangleleft \varepsilon_B \varepsilon_R B(\varepsilon_R \otimes B) \Psi = \varepsilon_{R \otimes B} \Psi = \varepsilon_{B \otimes R} \) we have proved that \( (B, \Delta_B, \varepsilon_B, \triangleleft) \) is a right \( R \)-module coalgebra. Similarly one can prove that \( (R, \Delta_R, \varepsilon_R, \triangleright) \) a left \( B \)-module coalgebra.

By applying \( r_R(R \otimes \varepsilon_H) \otimes l_H(\varepsilon_R \otimes H) \) and \( l_H(\varepsilon_R \otimes H) \otimes r_R(R \otimes \varepsilon_H) \) respectively to both sides of the first equality in (20) (see e.g. Figure 13) one can prove the relations:
\[
\Psi = (\triangleright \otimes \triangleleft)\Delta_{B \otimes R} \quad \text{and} \quad c_{R,B} \Psi = (\triangleleft \otimes \triangleright)\Delta_{B \otimes R}
\]
By the two relations of (21) we deduce
\[
c_{R,B}(\triangleright \otimes \triangleleft)\Delta_{B \otimes R} = (\triangleleft \otimes \triangleright)\Delta_{B \otimes R}.
\]
By applying \( \varepsilon_R \otimes B \) to both sides of (14) we get the first equation in Figure 19. By the definition of the right action of \( R \) on \( B \) we get the relation in the middle of that figure. By using the first equation in (21) we get the last equality in Figure 19. Therefore we have proved the following equation:
\[
m_B(\triangleleft \otimes B)(B \otimes \triangleright \otimes \triangleleft)(B \otimes \Delta_{B \otimes R}) = \triangleleft(m_R \otimes B).
\]
The relation 6) from Definition 2.13 can be proved similarly. Finally, by composing both sides of (16) by \( \varepsilon_R \otimes B \) to the left and by \( u_B \otimes B \otimes u_R \) to the right we get:
\[
\triangleleft(u_B \otimes R) = u_R \varepsilon_R \varepsilon_R B
\]
The details of the proof are given in Figure 20. Analogously one can prove relation 4) from Definition 2.13. In conclusion, we have proved that \( (R, B, \triangleleft, \triangleright) \) is a matched pair and that \( \Phi \) is a morphism of coalgebras.
It remains to prove that $\Phi$ is an isomorphism of algebras. Obviously $\Phi$ is an unital homomorphism. By (21) it follows that $m_{R \rtimes B} = (m_R \otimes m_B)(R \otimes \Psi \otimes B)$. Since $i$ and $\sigma$ are morphisms of algebras and $m_A$ is associative we get

$$
\Phi m_{R \rtimes B} = m_A(i \otimes \sigma)(m_R \otimes m_B)(R \otimes \Psi \otimes B) = m_A(m_A \otimes A)(i \otimes m_A(i \otimes \sigma) \Psi \otimes \sigma)
$$

$$
= m_A(m_A \otimes A)(i \otimes \Phi \Psi \otimes \sigma) = m_A(m_A \otimes A)(i \otimes \Theta \otimes \sigma)
$$

$$
= m_A(m_A \otimes A)[i \otimes m_A(\sigma \otimes i) \otimes \sigma] = m_A(\Phi \otimes \Phi).
$$

Trivially $\Phi u_{R \rtimes B} = u_A$ since $i$ and $\sigma$ are unital homomorphism and $m_A(u_A \otimes u_A)\Delta_1 = u_A$, so the theorem is proved. 

\[\square\]
Figure 16. The proof of Eq. (17).

Figure 17. The proof of Eq. (20).

Figure 18. The proof of Eq. (21).

Figure 19. The proof of Eq. (23).
THEOREM 2.16. We keep the assumptions and notations in (2.11) and (2.11). We also assume that $A$ is cocommutative and $\xi$ is trivial, i.e. $c_{A,A}\Delta = \Delta$ and $\xi = u_Bm_1(\varepsilon_R \otimes \varepsilon_R)$. Then

$$(R,B,\triangleright,\triangleleft)$$

is a matched pair of bialgebras such that $A \simeq R \rtimes B$, where

$$(25) \quad \triangleright := B\mu = pm_A(\sigma \otimes i) : B \otimes R \to R \quad \text{and} \quad \triangleleft := \mu_B = \pi m_A(\sigma \otimes i) : B \otimes R \to B.$$ 

Proof. Since $\xi$ is trivial, by [BD3, Proposition 3.7(5)] it follows that $R$ is an algebra and $i : R \to A$ is an algebra homomorphism. Our aim now is to show that $i : R \to A$ is a coalgebra homomorphism too. In view of [BD3, Proposition 3.7(8)] it is enough to prove that

$$(26) \quad B\rho_R = (u_B \otimes R)\mu_R^{-1} \quad \text{and} \quad (\pi \otimes \pi)\Delta_A i = (u_B \otimes u_B)\Delta_R \varepsilon_R.$$ 

Since $\pi$ is a coalgebra homomorphism, the second equality follows by [BD3, Proposition 3.7(6)]. Let us prove the first one. Indeed, as $R$ is the equalizer of $(A \otimes \pi)\Delta_A$ and $(A \otimes u_B)\mu_R^{-1}$, we have

$$(p \otimes \pi)\Delta_A i = (p \otimes B)(A \otimes \pi)\Delta_A i = (p \otimes B)(A \otimes u_B)\mu_R^{-1}i = (R \otimes u_B)(p \otimes 1)\mu_R^{-1}i$$

Therefore

$$(27) \quad B\rho_R = (\pi \otimes p)\Delta_A i = (\pi \otimes p)c_{A,A}\Delta_A i = c_{A,A}(p \otimes \pi)\Delta_A i = c_{A,A}(R \otimes u_B)\mu_R^{-1}$$

Thus we can apply Theorem 2.15. In our case

$$\Psi = \Phi^{-1}\Theta = (p \otimes \pi)\Delta_A m_A(\sigma \otimes i).$$

In view of (2.1), it results

$$\triangleright = r_R(R \otimes \varepsilon_B)(p \otimes \pi)\Delta_A m_A(\sigma \otimes i) = pr_A(A \otimes \varepsilon_B)\Delta_A m_A(\sigma \otimes i) = pm_A(\sigma \otimes i).$$

In a similar way we get

$$\triangleleft = \pi m_A(\sigma \otimes i).$$  □

2.17. We keep the assumptions and the notations in (2.11) and (2.11). We take $A$ to be a cocommutative bialgebra in $\mathcal{M}$ with trivial cocycle $\xi$. Thus, by our results, $A$ is the double product of a certain matched pairs $(R,B,\triangleright,\triangleleft)$, where the actions $\triangleright$ and $\triangleleft$ are defined by relations (28). Our aim now is to investigate those bialgebras $A$ as above which, in addition, have the property that the right action $\triangleleft : B \otimes R \to B$ is trivial. We will see that in this case the left action $\triangleright : B \otimes R \to R$ is the adjoint action. More precisely, we have $\triangleright = \text{ad}$, where $\text{ad}$ is defined by:

$$\text{ad} = m_A(m_A \otimes A)(\sigma \otimes i \otimes \sigma S_B)(B \otimes c_{B,R})(\Delta_B \otimes R).$$
Moreover, $A$ can be recovered from $R$ and $B$ as the ‘bosonization’ $R \# B$, that is $A$ is the smash product algebra between $R$ and $B$, and as a coalgebra $A$ is isomorphic to the tensor product coalgebra $R \otimes B$. Recall that the multiplication and the comultiplication on $R \# B$ are given:

$$m_{R \# B} = (m_R \otimes m_B)(R \otimes i \otimes R \otimes B)(R \otimes B \otimes \varepsilon_R \otimes B)(R \otimes \Delta_B \otimes R \otimes B),$$

$$u_{R \# B} = (u_R \otimes u_B)\Delta_1,$$

$$\Delta_{R \# B} = (R \otimes c_{R,B} \otimes B)(\Delta_R \otimes \Delta_B),$$

$$\varepsilon_{R \# B} = m_1(\varepsilon_R \otimes \varepsilon_B).$$

**Proposition 2.18.** We keep the assumptions and notations in (2.1) and (2.11). We also assume that $A$ is cocommutative and $\xi$ is trivial.

a) The action $\triangleleft : B \otimes R \rightarrow B$ is trivial if and only if $\pi$ is left $B$-linear.

b) If $\triangleleft$ is trivial then the left action $\triangleright : B \otimes R \rightarrow R$ is the adjoint action.

c) If $\triangleleft$ is trivial then $A \simeq R \# B$, where $B$ acts on $R$ by the left adjoint action.

**Proof.** Since $(R, i)$ is the equalizer of $(A \otimes \pi)\Delta_A$ and $(A \otimes u_B)r_A^{-1}$ we get

$$(A \otimes \pi)\Delta_A i = (A \otimes u_B)r_A^{-1} i$$

By applying $\varepsilon_R \otimes B$ to the both sides of this relation we get $\pi i = u_B \varepsilon_R$. Now we can prove a). If we assume that $\pi$ is left $B$-linear, i.e. $\pi m_A(\sigma \otimes A) = m_B(B \otimes \pi)$, then it results

$$\triangleleft = \pi m_A(\sigma \otimes i) = m_B(B \otimes \pi i) = m_B(B \otimes u_B \varepsilon_R) = r_B(B \otimes \varepsilon_R).$$

This means that $\triangleleft$ is trivial. Conversely, let us assume that $\pi m_A(\sigma \otimes i) = r_B(B \otimes \varepsilon_R)$. In order to prove that $\pi m_A(\sigma \otimes A) = m_B(B \otimes \pi)$ we compute $\pi m_A(\sigma \otimes \Phi)$. We get

$$\pi m_A(\sigma \otimes \Phi) = \pi m_A[\sigma \otimes m_A(\sigma \otimes i)] = \pi m_A(\sigma \otimes i)(m_B \otimes R) = r_B(B \otimes \varepsilon_R)(m_B \otimes R)$$

$$= m_B(B \otimes m_A(\sigma \otimes i)) = m_B(B \otimes \pi \Phi).$$

Since $B \otimes \Phi$ is an isomorphism we deduce the required equality.

b) The proof of $i \triangleright = \text{ad}$ is given in Figure 21. The definition of the action $\triangleright$ together with $i \rho = m_A(A \otimes \Phi)\Delta_A$ and $\Phi = \sigma S_B \pi$ yield the first equality. The next one is obtained by applying the compatibility relation between $m_A$ and $\Delta_A$ and the fact that $\sigma$ is a morphism of coalgebras.

By the first part of the proposition, $\pi$ is left $B$-linear. Thus we have the third equality. By using $\pi i = u_B \varepsilon_R$ and the properties of the unit and counit we conclude the proof of $i \triangleright = \text{ad}$. 

![Figure 21](image-url) 

**Figure 21.** The proof of $i \triangleright = \text{ad}$. 

c) We already know that $\triangleright$ is induced by the left adjoint action. Obviously, if the right action $\triangleleft$ is trivial then $m_{R \# B} = m_{R \otimes B}$, where $m_{R \# B}$ is defined in (2.17).
